Among the chief roads which defaulted in their interest in 1883, was the Toledo, Cincinnati, and St. Louis. This was a narrow-gauge railroad built up by consolidation and extension since 1880, until it comprised 800 miles. It runs through a country well supplied with railroads. It attracted a large amount of Boston capital, but confidence failed before the floating liabilities incurred in its construction were cleared away, and it went into the hands of receivers in July, involving the house of Ballou & Co. in its failure. The Connotton Valley and the Danville, Olney, and Ohio, other defaulting roads, were built through the same region of railroads and lacked terminal advantages. The Richmond and Allegheny extended through a district not sufficiently developed. The Louisville, Evansville, and St. Louis connects with the Louisville and Nashville, forming a fairly direct route between Louisville and St. Louis, yet was unable to pay its interest and asked for an extension. The Denver and New Orleans succumbed to the competition of parallel roads and the declension of the mining industry, causes which were operative also in the failure of the Denver, Utah, and Pacific. The Little Rock and Fort Smith was wound up in consequence of

a decision of the courts making the State bonds, issued in aid of its construction, a first lien. The Massachusetts Central, which has no termini or connections, could not pay working expenses. The New York City and Northern failed to obtain the expected share in the Boston through traffic, and did not get enough business to meet the interest of the debt incurred to complete the road. The bonds of these delinquent companies aggregate \$45,095,500.

Notable among the changes and operations of the year were the lease of the Central railroad of New Jersey, which had passed through liquidation, to the Philadelphia and Reading Company. The operations of great capitalists have in recent years been directed largely to the railroad system of the South. In the summer it was announced that the Richmond and Danville, with its connecting line, had been acquired by a syndicate, supposed to be working with the East Tennessee Company. The two combinations control the main portion of the Southern railway system.

The completion of the Northern Pacific railroad was the most important accession to the railroad system of the United States made in 1888, and the failure of Henry Villard, who had financed this great work, was the chief financial collapse. By means of a "blind pool" he succeeded in acquiring control of the partly constructed Northern Pacific road, with the intention of completing the line to the Pacific before the expiration of the term for completion prescribed in the Government concession. The Oregon Railway and Navigation, managed by him, the prosperity of which was endangered if the Northern Pacific fell into other hands, partly pledged its credit for the object. The Oregon Transcontinental Company was established to manage the two concerns for their mutual interest, and to construct feeders to the line. By means of the Oregon Railway and Navigation and the Northern Pacific securities, which were acquired through the workings of the "blind pool," and constituted the assets of the Oregon Transcontinental Company, large sums were borrowed. These were loaned in turn to the Northern Pacific Railroad, which was thereby enabled to go on with the work of construction without appearing as a borrower in the open market. The railroad was completed, but only by incurring a mass of floating debt, and still lacked much of being in a proper working condition. The management were obliged to seek an additional loan of \$20,000,000 to fund these liabilities and complete the enterprise. The bears attacked the stocks on account of their vulnerable character; and Mr. Villard was obliged to retire from the control of the property.

Atlantic Cables. — The American Company, which laid a cable in connection with the Western Union Telegraph Company, to receive its European business, joined in the combination of the cable companies, which divide their receipts, according to the present pooling ar-

rangement, in the following proportions: Anglo-American, 48·825 per cent.; American Company, 22·500 per cent.; Direct United States, 16·275 per cent.; French Company, 12·400 per cent. A competing company was organized in 1883, by Messrs. Mackay and J. G. Bennett, who contracted with Messrs. Siemens to have an Atlantic cable put down from Ireland to Nova Scotia, and thence to the United States, by June, 1884, and another cable of the same length, with connecting wires between Ireland and France, a few months later. By carrying their line directly to Nova Scotia the Mackay-Bennett company avoid the occasional accidents from fishing-smacks, which happen to some of the Anglo-American Company's cables in the shallow waters between Newfoundland and Nova Scotia. The monopoly possessed by the original cable company was expected to be broken by the Direct Cable Company, and by the second French Company which recently laid a cable. These cables, which are said to be the only well-laid and durable ones, were brought under the control of the original Atlantic Company. The financial operations connected with the launching of the various companies, and with the acquisition of a control over them by the Atlantic Company, have resulted in extraordinary over-capitalization.

Financial Events of the Year. — The factors entering into the critical financial situation in 1888 began to manifest themselves two years before. In consequence of the deficient harvest of 1881, from which the troubles date, there was a crisis in the grain and cotton markets in the beginning of 1882. There was a bank failure in Boston in March of that year, and a critical stringency in the money market, which was removed by the succor brought by the Secretary of the Treasury through the redemption of large amounts of bonds. The great strike in the iron trade, lasting from June till September, and the railroad war in the Northwest, toward the close of 1882, were significant episodes of the situation. In December occurred a breakdown in the petroleum market, and heavy failures in the trade.

In February, 1888, occurred heavy failures in the iron trade. In March the employers were victorious in a strike of iron-workers, and reduced wages. In June, again, there were suspensions in the iron industry.

An attempt to "corner" the lard market by Chicago speculators ended disastrously for the manipulators in June. Speculations for a rise in grain and provisions were more active than usual in the early part of the season, owing to the unfavorable weather of the preceding winter and the poor outlook for the winter wheat crop, the not encouraging opening of the spring, and the still gloomier prospects in Europe, where autumn rains prevented as much wheat being sown as usual and injured what was sown, while the spring opened cold and dry. As summer advanced and the crop prospects greatly improved, the vast transactions for future

deliveries looked less favorable for the bulls, some of whom sold out. McGeoch, Everingham & Co., the largest provision-dealers in Chicago, bought up immense quantities of lard, at increasing prices, which stimulated the supply, until they were unable to carry the operation further. They refused to accept a large lot on the pretext that it was adulterated; but it soon transpired that their credit was exhausted, and the artificially sustained market suddenly turned. The losses were several millions, and their suspension followed. In June and the following month occurred the serious disturbance to all mercantile and financial affairs, produced by the strike of telegraph operators. In the beginning of August occurred the failure of Shaw & Co., the largest leather manufacturers in the country, who operated numerous tanneries in New England, and were for some time able to control the entire trade. The week after two banks failed in St. Albans, Vermont, being involved with a railroad constructor who was unable to complete and carry his enterprise, that of an outlet for the Canadian railroads through Vermont. Bank failures occurred later in Chicago, where two institutions with \$4,250,000 deposits suspended.

In the beginning of November occurred the failure of Morris Ranger in Liverpool, the largest dealer in the English cotton trade, who had sold futures all through the summer in the expectation of another large cotton-crop. When the drought disappointed this calculation it was still believed that the state of the industry in England, and the extent to which the Continent was already supplied, would lead to lower rates. The shipments to the Continent were, however, heavier than the year before. The price advanced from 5½¢ for middling uplands to 6¼¢, but Ranger continued to sell until forced to suspend, with a loss of \$5,000,000.

The speculations which interrupt the normal current of grain exportation, and disorder the transportation and mercantile business connected with it, aggravated the situation toward the close of the calendar year, when every dollar that could be obtained from the sale of the crop surplus at this time, while concurrent supplies were streaming into European markets from other sources, was needed to revive the flagging economic activities. From the commencement of the crop year to the 1st of December, five months, the exports of wheat and flour amounted to less than 51,000,000 bushels, against 83,250,000 bushels the season before, and 62,500,000 bushels in the short-crop season of 1881. At the same date the quantity in sight was 35,000,000 bushels, against 20,000,000 bushels in 1882, and less than 19,000,000 in 1881.

FISH COMMISSION. See UNITED STATES FISH COMMISSION.

FLOODS IN THE OHIO VALLEY. The valley of the Ohio river was visited in February, 1883, by higher and more destructive floods than had been known since the country was settled. The ground had been frozen and covered with snow.

The heavy rains of the 2d and 3d of the month had caused high freshets in Western Pennsylvania and Northern Ohio, Indiana, and Illinois, by which much property had been destroyed and considerable damage done, particularly along the Allegheny river from Oil City to Pittsburg, near Akron, and at Cleveland, where loss by fire was one of the indirect consequences of the flood. With continued rains, the Ohio river rose during the next two weeks to an extraordinary height, from Cincinnati to its mouth. The culmination of the flood at Cincinnati occurred on the 15th, when the water reached the height of sixty-six feet four inches, covering all the houses fronting on the shore, and extending up into the densely built part of the city for a distance of more than three squares. The approaches to the bridges across the river were inundated. The trains on most of the railroads entering the city were prevented from reaching the principal stations. Two days before the waters attained their extreme height, the damage inflicted had been estimated at \$1,500,000, and 220 wholesale grocery and commission houses in the lower-lying districts had been covered by the flood. Thirty thousand persons were for some time deprived of employment. The furnaces at the gas-houses were extinguished, and the city was consequently deprived of all light from that source, while the engines of the water-works were so far disabled that an exhaustion of the supply of water for domestic purposes became imminent. The United States military barracks at Newport, Ky., were flooded; nearly two square miles of that city were overflowed; and the sister city of Covington, Ky., suffered in a corresponding degree. The freight depot of the Cincinnati Southern railroad in Cincinnati was undermined and fell into between thirty and fifty feet of water, carrying with it a number of persons of the crowd that had collected in it, a few of whom were drowned. At Lawrenceburg, Ind., every house in the "Old town" was filled with water for two stories; many buildings were wholly destroyed; 800 families were deprived of their means of support, and 5,000 persons were fed by relief committees. At Louisville, Ky., the "cut-off" dam—a structure 2,000 feet long, 200 feet thick at the base, and 40 feet thick at the top, which had been built expressly for protection against high water—was broken during the night of the 12th. More than 250 houses were immediately covered with water, and many of them were washed from their foundations. Those of the inmates of these houses who had not already removed in anticipation of the danger, were rescued, with but little loss of life. Four fifths of the city of Jeffersonville, Ind., opposite to Louisville, was laid under from three to twenty feet of water; about 6,000 people suffered in person and property, and more than half the business men of the town were financially ruined or seriously embarrassed. At New Albany, Ind., the water

reached a height of seventy-three feet, or four feet greater than that of the flood of 1882. Very many dwellings and business houses were wrecked by the flood and the strong wind; several extensive manufacturing establishments were stopped and suffered damage to their permanent property, and about 5,000 persons were turned out from their homes and reduced to dependence on outside relief. The entire amount of the direct loss by the flood suffered by the towns in Indiana, from New Albany to the State line of Ohio, was estimated as follows:

New Albany.....	\$730,000
Jeffersonville.....	925,000
Madison.....	300,000
Aurora.....	150,000
Lawrencsburg.....	485,000
Losses in the intervening country.....	300,000
Total.....	\$2,740,000

About 24,000 people were made temporarily homeless and dependent. The damage was less serious below New Albany. The worst was suffered at Shawneetown, Ill., where, out of 600 houses, all but twenty-eight were flooded in their second stories, and the water ran in a swift current fifteen feet deep through the main street. At Alton and Tell City, Ind., and Uniontown and Enterprise, Ky., the water entered every house.

The legislatures of Ohio and Indiana each appropriated \$100,000 for the relief of the sufferers. Papers for voluntary subscriptions were opened at several points. A steamboat was chartered by the relief committee of Indianapolis, and distributed supplies which had been furnished by voluntary contribution, wherever they were needed. The wants of the sufferers in Cincinnati were attended to by their more fortunate fellow-citizens, and the supplies destined for that city were sent to other places.

All the tributaries of the lower Ohio were affected by the floods, but without causing as serious damage as was suffered immediately on that river.

The highest flood ever known before on the Ohio river since the settlement of the country, was on the 18th of February, 1882, when the water reached the height of 64 feet 3 inches. Other great floods were recorded December 17, 1847, 68 feet 7 inches; in 1882, 58 feet 7 inches, and in 1862, 57 feet 4 inches. The Indians are said to have told the first settlers of the city of a flood that occurred, as nearly as can be surmised, about 1774, which reached the height of 100 feet.

FLORIDA. State Government.—The following were the State officers during the year: Governor, William D. Bloxham, Democrat; Lieutenant-Governor, L. W. Bethel; Secretary of State, John L. Crawford; Treasurer, Henry A. L'Engle; Comptroller, W. D. Barnes; Attorney-General, George P. Raney; Superintendent of Public Instruction, E. K. Foster; Commissioner of Lands and Immigration, P. W. White; Judiciary, Supreme Court: Chief-Justice, Edwin M. Randall; Associates, James D. Westcott, Jr., and R. B. Van Valkenburgh.

Legislative Session.—The Legislature convened on the 2d of January, and adjourned on the 2d of March. Among the acts passed were the following:

An act to protect the food-fishes of Florida.

An act in relation to injunctions.

An act for the relief of Jacksonville, and the counties of Baker, Bradford, Columbia, Suwannee, Madison, Jefferson, Duval, and Leon.

An act to provide for the relinquishment of the dower of insane married women.

An act to repeal an act to dissolve municipal corporations under circumstances therein stated, and to provide governments for the same.

An act to prescribe the duties of treasurers of municipal governments as to warrants or orders which may be presented to them and not paid upon presentation.

An act to prescribe the duties of county treasurers as to warrants or orders which may be presented to them and not paid upon presentation.

An act to prohibit officers of municipal corporations from buying at a discount or speculating in city or town scrip, and to provide a penalty therefor.

An act to punish the breaking, and entering without breaking, of a building in the day-time, or entering in the night-time without breaking, with intent to commit a misdemeanor.

An act authorizing the Board of Education to compromise and settle with counties indebted to the school and seminary funds.

An act to prohibit county officers from buying at a discount, or speculating in State, county, or school scrip, and to provide a penalty therefor.

An act to punish slander and defamation of character in certain cases.

An act making appropriations for the expense of collecting revenue for the year 1883.

An act to prescribe the manner in which lands assessed prior to Jan. 1, 1883, shall be advertised for sale for uncollected taxes.

An act fixing the liability of persons and corporations for damages resulting from the death of any one caused by the wrongful act, negligence, carelessness, or default of such persons or corporations, or the agents thereof.

An act to prohibit the sale or distribution of intoxicating liquors on election-days, and to provide a punishment for the same.

An act relating to the crime of larceny.

An act to provide for the maintenance of organized fire companies in cities in this State.

An act to prohibit school officers from dealing in school text-books.

An act to amend an act entitled "An act to provide a uniform system of quarantine in this State," approved March 11, 1879, being Chapter 8162, Laws of Florida.

An act requiring uniformity of text-books in the public schools of this State.

An act to prohibit persons shipping oranges grown outside of the State as Florida oranges.

An act to provide for investments by the Board of Education of the State of Florida, of moneys of the common-school fund.

An act to provide for teachers' institutes.

An act to provide for normal instruction.

An act levying a tax for the years 1883 and 1884.

An act for the assessment and collection of revenue.

An act to fix the pay of the members, officers, and attaches of the Legislature of 1883.

An act to provide an institution for the blind, deaf and dumb in this State.

An act to protect the growing sponge in this State.

An act in relation to small estates, and to save them from wasteful costs and expenditures.

An act to enable actual settlers to procure homes.

An act to keep in good repair the public roads and highways of this State, and to amend an act entitled

"An act to keep in good repair the public roads and highways in this State," approved March 7, 1881.

An act to declare what notice shall be given to non-resident parties and parties whose residence is unknown upon application to sell real estate in which they are interested.

An act making appropriations for the years 1883 and 1884.

An act in relation to the apportionment of the one-mill State tax for school purposes.

An act to regulate the sale of liquors, wines, and beer in the State of Florida by the Boards of County Commissioners of the several counties.

An act granting aid for the construction of the Thomasville, Tallahassee, and Gulf Railroad.

An act to incorporate an institution of learning at Starke, Bradford county, Florida, under the name of Orange College.

An act to incorporate the International Railroad and Steamship Company of Florida.

An act to incorporate the Fort Meade, Keystone, and Walk-in-the-Water Railroad Company.

An act to incorporate the Alachua Steam Navigation and Canal Company.

An act to incorporate the Florida Ship-Canal Company, to locate, construct, own, and operate a ship-canal and telegraph line across the Peninsula of Florida, to connect the Atlantic ocean with the Gulf of Mexico.

An act to incorporate the Ocklawaha Steamboat, Canal, Drainage, and River Improvement Company.

An act to incorporate the Florida Land and Colonization Company.

An act to incorporate the South Florida Railroad Company.

An act to grant certain lands to the Jacksonville, St. Augustine, and Halifax River Railway Company.

An act to incorporate the Fernandina and Amelia Beach Railroad Company.

An act to incorporate the Atlantic and Mexican Gulf Canal Company, and to grant certain privileges therein named.

An act to incorporate the Bank of the State of Florida.

An act to incorporate the Florida and European Steamship Company.

An act to incorporate the Seville and Halifax River Railroad Company.

An act to grant certain lands to the Green Cove Spring and Melrose Railroad Company.

Joint resolution in reference to a Constitutional Convention.

Joint resolution empowering the electors at the next general election to vote for or against a convention.

In the bill providing for normal instruction four institutions are named in which normal departments shall be established—the East and the West Florida Seminaries, and the Union and Lincoln Academies. The East Florida Seminary and Union Academy are located at Gainesville; the West Florida Seminary and Lincoln Academy at Tallahassee.

Under the provisions of the revenue law, mortgages are not to be taxed; non-bearing orange-groves are not to be taxed at a fictitious value, but merely as improved lands; the license-tax on physicians and lawyers has been omitted, and the bill provides for an ad valorem tax of five mills instead of seven, and leaves it discretionary with the Governor to reduce it to four mills for 1884.

The counties for whose relief provision was made are those that became involved in building the railroads through Middle and East Florida. The bill gives the remnant of the internal improvement lands proper to them,

being upward of 175,000 acres. A bill to create a railroad commission failed to pass.

Agricultural College and University.—The trustees of the Agricultural College determined to remove the institution from Eau Gallie, where its site had previously been fixed, though no organization was ever effected. The fund amounts to about \$140,000, invested in State bonds, and yields an annual interest of nearly \$9,000. The act of Congress prescribes that no part of the fund shall be used for the erection of buildings. These, together with 100 acres of land for experimental gardens, were to be provided by the locality desiring the institution. Bids were submitted by Gainesville, Live Oak, Lake City, Starke, Tallahassee, Ocala, and Madison, varying in amounts from \$10,000 to \$50,000. Lake City was chosen.

The Florida University was incorporated under a liberal charter in February. It is authorized to have five colleges, to wit: Tallahassee College of Medicine and Surgery, College of Literature and Science, Law College, Theological Institute, and Polytechnic and Normal Institute. At present only two departments are organized—the West Florida Seminary and Military Institute, constituting the Literary Department, and the Tallahassee College of Medicine and Surgery, the Medical.

Railroad Taxation.—Among the decisions of the Supreme Court of the United States was one in the case of the Louisville and Nashville Railroad Company, plaintiff in error, against Manuel Palmes, collector, etc., in error, to the Supreme Court of the State of Florida:

The question presented by this case is whether a line of railroad which was commenced, partly completed, and operated by the Alabama and Florida Railroad Company, and which through successive transfers has finally come into the hands of the Louisville and Nashville Railroad Company, is or is not exempt from taxation by virtue of an act passed by the Legislature of Florida in 1855, and known as the Internal Improvement Act. This court holds that the exemption from taxation created by the 18th section of the Internal Improvement Act of 1855 is in every respect similar to that which was declared by this court in the case of Morgan against Louisiana, 93 United States, 217, to be non-assignable. Such exemption, therefore, did not pass from the Alabama and Florida Railroad Company to the Pensacola and Louisville Railroad Company when the former conveyed to the latter its roads and franchises connected with and necessary in its construction and operation. Even, however, if such exemption had passed to the Pensacola and Louisville Railroad Company, that corporation would have had no power to further convey it, so that the line of the railroad in its present hands is properly liable to State taxation, and its present owners can not claim immunity on the ground that the act of 1875, taxing the property of all corporations, was an impairment of the obligation of the contract of 1855. The decree of the Supreme Court of Florida was affirmed with costs.

There are two other railroad corporations with like interests involved in the determination of the suit mentioned above. These are the Florida Central and Western, assessed for 1883 at \$2,022,799.20, and the Florida Transit and Peninsular at \$2,249,100; the Louisville

and Nashville is assessed at \$463,800. The action of the courts thus adds nearly \$5,000,000 of property to the revenue resources of the State, such valuation being made taxable under the decision. At average rate of State and county taxation for 1883 the property thus made liable will yield about \$30,000 revenue.

Agriculture.—The agriculturists of Florida are rapidly turning their attention to the cultivation of fruits and early vegetables. This naturally leads to small farms and an improved system of cultivation. Truck-farming is becoming more general each year, and adds greatly to the resources of the State. Truck-farmers, in most cases, own the land they cultivate. As early as February 1st they send forward to the Northern markets tomatoes, green peas, cucumbers, and other vegetables, which bring, at this early season of the year, remunerative prices, and find a ready sale. The culture of strawberries and other small fruits is rapidly increasing and proves profitable. The cultivation of oranges, lemons, and other tropical fruits continues to increase annually, and this industry will soon become one of the most important in the State. The value of the orange business alone in 1880 amounted to \$1,000,000, with an employed capital of more than \$10,000,000, and the industry has steadily increased since. About 75 trees are planted to the acre, the average yield exceeding 500 oranges to the tree. The trees begin to bear when about seven years old, and reach their prime in twenty years, but will continue to be productive, it is estimated, seventy-five or eighty years longer.

The Everglades.—A report has been made by the expedition sent into the Everglades by the New Orleans "Times-Democrat." It establishes the fact that the Everglades from Lake Okechobee to Cape Sable are worthless for any purposes of cultivation; that they contain no large tracts of land above water; that they can not be successfully drained; and that the establishment and maintenance of a telegraph line along the route traversed would be impossible. The Everglades, and especially the northern glades, are a vast swamp, irreclaimable and useless. The only portions of the southern peninsula capable of cultivation lie on the Atlantic and Gulf coasts, with this vast morass between them.

FOODS, COMPOSITION AND NUTRITIVE VALUES OF. It is a striking fact that while the chief item of the living expenses of the majority of civilized men is the cost of their food, even the most intelligent know less of the actual value of their food than of any other of the important articles they buy. It makes but little difference to the man with \$5,000 per annum whether he pays fifteen cents or five dollars per pound for the protein of his food, provided it pleases his palate. But to the humble housewife, whose husband earns but \$500 a year, it is a matter of great importance; and she is very apt, after hesitating at the dry-goods store between two pieces of calico for her daughter's

dress, and taking one at ten cents a yard for economy's sake, though the one at eleven was prettier, to go to the grocers, the butchers, or the fish-dealers, and pay a dollar per pound for the nutrients of her children's food, when she might have obtained the same ingredients, in forms equally wholesome and nutritious, for fifty or even twenty cents. She will continue this bad economy until she obtains a general idea of the actual cheapness and dearness of foods as distinguished from their price.

The "Annual Cyclopædia" for 1881 contained an article upon the "Nutritive Values of Foods," in which were given the proportions of nutritive ingredients in a considerable number of the more common animal and vegetable foods as shown by chemical analysis. The figures for fish, oysters, etc., were selected from the results of an investigation undertaken under the auspices of the Smithsonian Institution and the United States Fish Commission in the chemical laboratory of Wesleyan University, Middletown, Conn., by Prof. W. O. Atwater.* The data for other foods were compiled from European sources, no considerable investigations of the composition of American foods other than fish having at that time been made. Since then the researches upon fish have been continued, and a large number of specimens of our animal and vegetable foods have also been studied; those of animal and some vegetable foods by Prof. Atwater, and others of vegetable foods, by Prof. W. H. Brewer† of the Sheffield Scientific School, New Haven, Conn., and still others by other investigators. During the same period new researches upon the digestibility of foods, and upon the functions of their nutritive ingredients, have likewise been published, so that we are able to-day to present new and important facts regarding the nutritive values of food in general, and especially the composition of our own food-materials.

The article referred to in the "Annual Cyclopædia" for 1881 contained some explanations of the chemistry of foods and the functions of their ingredients in nutrition. To those who have made no special study of the matter, however, the following brief statements may be interesting, the more so because late investigations are tending to decide some disputed questions regarding the ways in which food is used in the body, and because many of the statements found in current works on chemistry and physiology have become of little value in the light of the latest knowledge. A considerable number of the analyses of American foods given below appear in print for the first time in this article.

Viewed from the stand-point of their uses in the nutrition of man, the constituents of ordi-

* See partial account of results in "Report of United States Fish Commission, 1880" (published in 1883).

† Published in the "Report on Cereal Products of the United States." By Prof. Brewer. "United States Census, 1880," vol. iii.

nary food-materials may be succinctly classified as follows:

1. *Edible Substances*: e. g., the flesh of meats and fish, the shell-contents of oysters.

2. *Refuse*: e. g., bones of meat and fish, shells of oysters.

The edible substance consists of—

1. *Water*. 2. *Nutritive Substances or Nutrients*. The refuse may, for our present purpose, be left out of account, and our attention confined to the edible substance. And, as the water which forms a part of the edible substance, though indispensable, is nevertheless inexpensive and distinct from the nutritive ingredients, we may consider simply the nutrients.

Speaking as chemists and physiologists, we may say that our food supplies, besides mineral substances and water, albuminoids, carbohydrates, and fats; and that these are transformed into the tissues and fluids of the body, muscle and fat, blood and bone, and are consumed to produce heat and force. Viewed from a chemico-physiological stand-point, then, the nutritive ingredients of food can be classified as follows. Of the actually nutritive substances or nutrients of foods the most important groups (exclusive of water) are—

1. *Protein* (proteids, albuminoids, etc.): e. g., albumen ("white") of egg, fibrin of blood, "lean" of meat, gluten of wheat.

2. *Fats*: e. g., fat of meat, butter, olive-oil.

3. *Carbohydrates*: e. g., starch, sugar, glycogen.

4. *Mineral Matter or Ash*: e. g., calcium and potassium phosphates and chlorides.

The terms protein, proteids, and albuminoids, are applied somewhat indiscriminately, in ordinary usage, to several or all of certain classes of compounds characterized by containing nitrogen. The most important are the proteids or albuminoids, of which albumen, the white of egg, and myosin, the basis of muscle, are types. Allied to these, but occurring in smaller proportions in animal tissues and foods, are the nitrogenous compounds that make the basis of connective and other tissues. Gelatin is derived from some of these tissues, and may be taken as a type of the compounds of this class. As these constituents are of similar constitution and have similar or nearly similar uses in nutrition, it is customary to group them together as protein. The muscular tissues of animals, and hence the lean portions of meat, fish, etc., contain small quantities of so-called nitrogenous extractives—creatin, carnin, etc. (contained in extract of meat, etc.)—which contribute materially to the flavor and somewhat to the nutritive effect of the foods containing them. They are not usually deemed of sufficient importance, however, to be grouped as a distinct class in tabular statements of the composition of foods. Details regarding the nature and functions of the several classes of nutrients may be found in the article in the "Annual Cyclopædia" for 1881, referred to above. Concerning their

composition, it will suffice, then, to state that the compounds classed together as protein contain carbon, oxygen, hydrogen, and nitrogen, while the carbohydrates and fats contain no nitrogen, but consist chiefly of carbon, oxygen, and hydrogen. The fats are much richer in carbon than the carbohydrates. Animal foods, as meats, fish, etc., contain but little of carbohydrates, their chief nutrients being protein and fats. Milk, however, and some shell-fish, as oysters, scallops, etc., contain more or less of carbohydrates. Vegetable foods, as wheat, potatoes, etc., contain less protein and consist largely of starch, sugar, cellulose, and other carbohydrates.

Functions of Nutrients.—The different nutrients have different offices in nourishing the body, in building up its tissues, repairing its wastes, and serving as fuel to produce animal heat and muscular and intellectual energy. The chief part borne by each in nutrition is shown below:

<i>The protein of food</i>	{	forms the (nitrogenous) basis of blood, muscle, connective tissue, etc.
		is transformed into fats and carbohydrates, and stored as such in the body.
		is consumed for fuel.
<i>The fats of food</i>	{	are stored as fat.
		are consumed for fuel.
<i>The carbohydrates of food</i>	{	are transformed into fat.
		are consumed for fuel.

In classifications formerly maintained and frequently met with still, the protein compounds were regarded as the "flesh-formers" and the sources of muscular energy, while the carbohydrates and fat were looked upon as "fat-formers" and "heat-producers." A vast deal of painstaking research, however, has shown that these distinctions were not correctly drawn. The albuminoids are flesh-formers, it is true; indeed, flesh, i. e., muscular and other nitrogenous tissue, according to the nearly unanimous testimony of the most trustworthy experiments, is made from the nitrogenous constituents of the food exclusively. But the balance of testimony is decidedly against the production of muscular energy by nitrogenous compounds exclusively or mainly. Each of the three groups of nutrients probably shares, directly or indirectly, in this function. So, too, it appears that the combustion which produces animal heat is not confined to the carbohydrates and fats, but the protein compounds, or the products of their decomposition, are also used for this purpose. Again, the production of fat in the body was formerly ascribed to the fats and carbohydrates alone. The view was held at the same time, and is still maintained by some physiologists, that the carbohydrates can not be transformed into fats, and that a very large part of the fat of the body is formed from the disintegration of the albuminoids. The weight of evidence to-day is decidedly in favor of the assumption that all three of the great classes of nutrients in our foods—the

albuminoids, the carbohydrates, and the fats—are transformed into fat, and that the fat thus formed is consumed, either before or after being stored as body-fat.

It appears, then, that protein is the most important constituent of our food, because, while it performs the functions of each of the other two chief nutrients in being transformed into fat and in being consumed for fuel, it has a most weighty office of its own in forming the basis of the blood and in building up the muscular and other nitrogenous tissues, an office which no other nutrient can perform at all. And, as we shall see further, in examining the pecuniary cost, protein is the dearest as well as most important of the ingredients of foods.

The same experimental research which has revealed to us the ways in which our food supplies our bodily wants, has shown us how to estimate the relative nutritive values of different foods from their chemical composition. The estimates are only approximate, because the nutritive effects are influenced by various conditions, some of which research has not yet definitely explained, while others vary with the nature of the food or of the user, so that the value of a given food in a given case may vary from the standard set by the analysis. These sources of uncertainty are nevertheless so narrowed down by late investigation, and the errors confined within such limits, that by intelligent use of the facts at our disposal we may judge very closely from the chemical com-

position of a food what is its value as compared with others of the same class, at any rate, for our nourishment.

Chemical Analysis of Foods.—The following tables give the composition of a number of the more important kinds of animal and vegetable foods. The details will perhaps be best explained by an example. A sample of beef, sirloin, of medium fatness, was found to consist of about one fourth bone and three fourths flesh, edible substance. The flesh was analyzed and found to contain, nearly: water, 60 per cent.; protein, 19 per cent.; fats, 20 per cent.; mineral matters, 1 per cent. Calculated upon the whole sample of meat, of which one fourth, or 25 per cent., was bone and other refuse, and 75 per cent. flesh, the analysis would stand as in the schedule below, in which the composition of the flesh by itself and that of the meat, bone, and all, are both given:

	In flesh, edible portion.	In meat as bought, including refuse.
	Per cent.	Per cent.
Refuse, bone, etc.....	None.	25
Water.....	60	45
Protein.....	19	14.4
Fat.....	20	15
Mineral matters.....	1	0.7
Total.....	100	100

This very imperfect analysis may be stated in the following form, as is done in the tables beyond:*

CONSTITUENTS OF SAMPLE OF BEEF, SIRLOIN.

FOOD-MATERIAL.	IN EDIBLE PORTION— I. e., flesh freed from bone and other refuse.					IN MEAT AS PURCHASED— including both edible portion and refuse.

Beef, sirloin, medium fatness.....	60	40	19	20	1	25	45	80	14.8	15	0.7

Table I, on page 345, gives the composition of a number of animal foods, mostly from late American analyses. It is only a short time since analyses of American meats, fish, etc., have been undertaken in any considerable number, and those as yet accomplished are far from sufficient for a complete survey of the subject. Indeed, the work already done can be regarded only as a beginning. Still, the figures will give a tolerably fair idea of the composition of the articles named.

The analyses of this table, with the exception of a few from European sources and indicated by italics, are selected from the results of the investigation referred to above, as conducted under the auspices of the Smithsonian Institution and the United States Fish Commission. The specimens of meats were purchased from a dealer in Middletown, Conn., and said by him to be "fair average samples of the better kinds

of meats." A side of beef, freshly brought in winter from Chicago, and said to be a good specimen of first-class "Chicago beef," was cut into about twenty-five pieces in the ordinary way. From each a sample fairly representing the whole cut was taken and analyzed. Thus the composition of each piece and of the whole side was learned. The composition of one of the leanest portions, the round, a moderately fat piece, sirloin, a very fat portion, flank, and of the whole side, together with a tongue, liver, and heart from another animal, are given in the table. The samples of a side of mutton and of parts of the same side were obtained and analyzed in like manner, as were those of the other meats and fowl. The speci-

* The tables contain also columns for carbohydrates, etc., which occur in milk and in some shell-fish, but are not found in ordinary meats in sufficient amount to warrant their insertion in such tables as these.

* Italics indicate European analyses, the rest are American.

mens of cheese were from Washington market, New York, the analyses in the table representing averages of several samples. The butter was from a Vermont dairy. Some of the specimens of fish were purchased in Middletown, the most, however, were furnished gratuitously from Fulton market, New York, by Mr. E. G. Blackford, Fish Commissioner of the State of New York, who also contributed to the pecuniary expense of the investigation, as did likewise Mr. A. R. Crittenden, of Middletown; A considerable number of the specimens whose analyses are given in this table, and in Table II beyond, were furnished by Mr. F. B. Thurber, of New York, who also contributed a considerable sum toward defraying the cost of the research. It may be added that the figures in Table I (aside from those from European sources) are selected from the results of nearly three hundred analyses of American food ma-

terials, of which some two hundred are of fish and invertebrates. The analyses of fish, being more numerous, give more satisfactory figures and averages than those of meats, etc.

Table II gives analyses of vegetable food materials and beverages. The figures for wheat-flour represent the results of forty-nine analyses of American flours, of which the majority were analyzed under the direction of Prof. Brewer, and the rest collated by him from other sources for the "Report of the United Census, 1880." The largest and the smallest percentages of each ingredient found in the analyses are given opposite "maximum" and "minimum." The specimens of bread, crackers, etc., were purchased and analyzed at Middletown, Conn., and have probably about the usual composition of such materials.

An attempt is made in Tables III and IV to illustrate graphically the composition of some of the foods whose composition is given in Tables I and II.

* Of forty-nine analyses.
† From flour of about average composition.
The analyses of foods in Roman letters are American, those of foods and beverages in italics are European.

Comparative Costs of Nutritive Ingredients in Different Foods.—A subject that has received but little attention in this country, though it has become a vital one in Europe, and is becoming so with us, is the cost of the nutritive material of our foods. The relative cheapness or dearness of different foods must be judged by comparing, not the prices per pound, but the costs of the actual nutrients. In making such comparisons, the cost may be assumed to fall, not upon the inedible portions and the water, but solely upon the three classes of nutrients: protein, fats, and carbohydrates. The relative physiological values of the nutrients in different foods depend upon (1) their digestibility and (2) their functions and the proportions in which they can replace each other in nutrition. An accurate physiological valuation is, in the present state of our knowledge, at least, impracticable. The pecuniary costs of the nutrients are, however, more nearly capable of approximation.

Various methods have been proposed for computing the relative pecuniary costs of the nutrients of foods, none of which, however, are entirely beyond criticism. The following, based upon German estimates of the relative costs of protein fats and carbohydrates, is perhaps as satisfactory as any.

From extended comparisons of the composition and market prices of the more important animal and vegetable food-materials, such as meats, fish, flour, etc., those which serve for nourishment and not as luxuries, and form the bulk of the food of the people, it has been estimated that a pound of protein costs, on the average, five times as much, and a pound of fats three times as much, as a pound of carbohydrates; that, in other words, these three classes of nutrients stand related to each other, in respect to cost, in the following proportions:

Assumed ratios of costs in staple foods	{	Protein	5
		Fats	3
		Carbohydrates	1

Suppose a pound of beef of average fatness to cost 25 cents and to contain 25 per cent. of inedible matters, bone, etc., 45 per cent. of water, and 30 per cent. of nutritive substance, upon which latter—the bone and water being assumed to be without nutritive value—the whole cost comes. The 30 per cent. or $\frac{30}{100}$ pounds of nutritive substance thus costs 25 cents, or at the rate of 83 $\frac{1}{3}$ cents per pound. If, now, we leave out of account the minute quantities of carbohydrates and the mineral matters, the whole cost will fall upon the protein and fats. Assuming these to cost in the ratio of 5 : 3 and the amounts in the meat to be, protein 14 $\frac{1}{2}$ per cent. and fats 15 per cent., an easy computation will show the protein to cost 107.7 cents, and the fats 64.6 cents per pound. Proof: 14 $\frac{1}{2}$ pounds of protein at 107.7 cents = 15.8 cents; $\frac{15}{100}$ pounds of fats at 64.6 cents = 9.7 cents; 15.8 cents + 9.7 cents = 25 cents, the cost of the pound of meat which contained the given amounts of protein and fats. The above ratios, protein : fats : carbohydrates = 5 : 3 : 1, represent at best only general averages, and may in given cases be more or less incorrect. A method free from these objections consists in simply computing the amounts of nutrients that may be bought for the same price in different food-materials. At the same time the method above detailed is doubtless accurate enough for a general comparison of the relative cheapness and dearness of ordinary foods, and is used in calculating the costs of protein below.

Of the different nutrients, protein is physiologically the most important as it is peculiarly the most expensive. In fish, furthermore, as in the leaner kinds of meat, it is the predominant nutritive ingredient. For these reasons the cost of protein in fish and other foods may be used as a means of comparing their relative cheapness or dearness, as is done in the following table. The figures represent the ordinary prices per pound and the corresponding costs of protein, in specimens of food-materials obtained in New York and Middletown (Conn.) markets. Though the number of specimens is too small for reliable averages, the figures, taken together, doubtless give a tolerably fair idea of the relative costliness of the nutrients in the different classes of foods.

Thus the nutrients of vegetable foods are, in general, much less costly than in animal foods. The animal foods have, however, the advantage of containing a larger proportion of protein and fats, and the protein, at least, in more digestible forms. And further, the so-called "nitrogenous extractives" of kreatin, carmin, etc., of meats, which contribute so much to their agreeable flavor, exert a nutritive effect which, though not yet explained, is nevertheless important. It is these which give to "extract of meat" its peculiar flavor and stimulating effect.

Among the animal foods, those which rank as delicacies are the costliest. By the above

COMPARATIVE COSTS OF PROTEIN IN ANIMAL AND VEGETABLE FOODS.

FOODS.	Ordinary price per pound.	Cost of protein per pound.
	Cents.	Cents.
Beef: Sirloin, medium fatness.....	25	108

* Contain very little protein.

† Shell contents.

calculations, the protein in the oysters costs from two to three dollars, and in salmon rises to nearly six dollars, per pound. In beef, mutton, and pork, it varies from 108 to 48 cents; in shad, bluefish, haddock, and halibut, the range is about the same; while in cod and mackerel, fresh and salted, it ranges from 67 to as low as 33 cents per pound. Salt cod and salt mackerel are nearly always, fresh cod and mackerel often, and even the choicer fish, as bluefish and shad, when abundant, cheaper sources of protein than any but the inferior kinds of meat.

In short, we pay for many of our foods according to their agreeableness to our palates, rather than their value for nourishing our bodies. At the same time it is interesting to note that the prices of the materials that make up the bulk of the food of the people seem to run more or less parallel with their actual nutritive values. Here, as elsewhere, the resultant of the general experience of mankind has led slowly and blindly, but none the less surely, to the same general result to which accurate research more understandingly and quickly guides us.

Fish as Food.—As the investigation to which

a large number of the analyses of Tables I-IV belong was undertaken with an especial view to the study of fish as food for man, some more specific reference to fish may not be out of place here. The flesh of fish contains, in general, about the same proportions of protein, less fat, more water, and hence, on the whole, less nutritive material, than that of domestic animals used for food. Thus we have in the flesh of flounder only 16 per cent., and in that of cod 18 per cent. of nutrients, while ordinary lean beef has from 25 to 33 per cent., and the fatter meats considerably more. The fatter kinds of fish, however, as herring, mackerel, salmon, shad, and white-fish, approach nearer to medium beef. Dried and salted fish also contain good proportions of nutrients, the specimens of ordinary salt codfish having 28 per cent., salt mackerel 47 per cent. The edible portion of shell-fish is poor in nutrients, oysters varying from 9 to 19 per cent., and lobsters averaging 18 per cent.

Proportions of Nutrients in Fish and other Food-Materials as commonly sold.—Fish as found in the markets generally contain more refuse, bone, skin, etc., than meats, as is illustrated in Tables II and IV. With the larger proportions of both refuse and water the proportions of nutrients, though variable, are usually much less than in meats. Thus, a sample of flounder contained 67 per cent. of refuse, 28 per cent. of water, and only 5 per cent. of nutritive substance, while the salmon averaged 23 per cent., the salt cod 22 per cent., and the salt mackerel 36 per cent. of nutrients. The nutrients in meats ranged from 30 per cent. in beef to 46 per cent. in mutton, and 87½ per cent. in very fat pork (bacon). The canned fish compare very favorably with the meats. It is worth noting that the nutrients in fresh codfish, dressed, in oysters, edible portion, and in milk, were nearly the same in amount, about 12½ per cent., though differing in kind and proportions.

Vegetable foods generally have less water and more nutrients than animal foods. Ordinary flour, meal, etc., contain from 85 to 90 per cent. or more of nutritive material. But the nutritive value is not proportional to the quantity of nutrients, because the vegetable foods consist mostly of carbohydrates, starch, sugar, cellulose, etc., of inferior nutritive effect, and because their protein is less digestible than that of animal foods. Potatoes contain a large amount of water and extremely little protein or fats.

Uses of Fish as Food.—The chief uses of fish as food are (1) as an economical source of nutriment, and (2) to supply the demand for variety in diet, which increases with the advance of civilization and culture.

As nutriment, the place of fish is that of a supplement to vegetable foods, the most of which, as wheat, rye, maize, rice, potatoes, etc., are deficient in protein, the chief nutrient of fish.

The so-called nitrogenous extractives, con-

tained in small quantities in fish, as in other animal foods, are doubtless useful in nutrition. The theory that fish is especially valuable for brain-food, on account of an assumed richness in phosphorus, is not sustained by the facts of either chemistry or physiology.

It is an interesting fact that the poorer classes of people and communities almost universally select those foods which chemical analysis shows to supply the actual nutrients at the lowest cost. But, unfortunately, the proportions of the nutrients in their dietaries are often very defective. Thus, in portions of India and China, rice; in Northern Italy, maize-meal; in certain districts of Germany and in some regions and seasons in Ireland, potatoes; and among the poor whites of the Southern United States, maize-meal and bacon, make a large part, and in some cases almost the sole, food of the people. These foods supply the nutrients in the cheapest forms, but are all deficient in protein. The people who live upon them are ill-nourished and suffer physically, intellectually, and morally thereby.

On the other hand, the Scotchman finds a most economical supply of protein in oatmeal, haddock, and herring; and the rural inhabitants of New England supplement the fat of their pork with protein of beans, and the carbohydrates of potatoes, maize, and wheat-flour with the protein of codfish and mackerel, and, while subsisting largely upon such frugal but rational diets, are well nourished, physically strong, and noted for their intellectual and moral force.

As population becomes denser, the capacity of the soil to supply food for man gradually nears its limit. Fish gather materials that would otherwise be inaccessible and lost, and store them in the very forms that are most deficient in the produce of the soil. Thus, by proper culture and use of fish, the rivers and the sea are made to fulfill their office with the land in supplying nutriment for man.

FOOT-AND-MOUTH DISEASE. The foot-and-mouth disease is the most contagious of all the maladies which affect domestic animals. Nearly all four-footed beasts are liable to it, but the cloven-footed are especially predisposed to infection. Sheep, goats, swine, and cattle contract it with equal readiness and certainty. All the individuals of a herd or flock in which it makes its appearance are affected almost simultaneously. The period of incubation is about 36 hours, though in cold weather the symptoms seem to be delayed, and sometimes do not manifest themselves until six days after exposure to the infection. The symptoms are the swelling of the digits, blisters or ulcers between the hoofs, lameness, inflammation and tenderness of the udder and teats, with sores and blisters on those parts, frothing and slobbering at the mouth, a smacking noise made with the tongue and palate, and large, rounded blisters or angry sores on the mucous membrane of the mouth.

The British House of Commons in the session of 1888 passed a resolution prohibiting the importation into Great Britain of cattle from countries in which the foot-and-mouth disease exists. This was expected to stop altogether the trade in live cattle from the United States; but the British Government were unwilling to alter the regulations to gratify the protectionist desires, which were the motive of the resolution. The United States Treasury Cattle Commissioners were directed to inquire into the facts relating to the supposed existence of the complaint in the United States. In their report, made in the beginning of August, they declared the country to be entirely free of the disease. They found no trace of it in the cattle-depots at Kansas City, Council Bluffs, and Omaha, nor in the stock-yards along the line of transportation and on the Atlantic seaboard, nor in the dairy districts of the East. An epidemic of the foot-and-mouth disease, which spread from Canada into Northern New York and New England in the autumn of 1871, was brought from England by two cows imported into Montreal. The seclusion of the herds during the winter confined its action, and it soon disappeared. A cargo of Channel Island cattle suffering from the malady were landed at New York in 1881. These were quarantined by the State authorities. The steamship *France*, which brought them, after an imperfect disinfection, returned with a cargo of American beeves, which were condemned on their arrival in England as suffering from the foot-and-mouth disease. A similar case occurred in March, 1883, when a herd of Channel Island cattle, landed at Baltimore from the steamer *Nessmore*, were found to be affected with the disease, and were secluded so that the infection did not spread to the home herds; but the fat cattle which were shipped to England by the same vessel were found to be suffering from the disease on their arrival. The use of the head-ropes of diseased animals on others is believed to be a means of communicating the infection.

The foot-and-mouth disease has existed in various parts of Great Britain since 1880, in which year it is supposed to have been brought into England by a French cow. Ireland was free from it for many years; but recently it has committed great ravages in that country. A Westmoreland bull is believed to have contracted it from contact with a cargo of infected cattle at Liverpool, and contaminated the Irish herds. In 1883 occurred an outbreak in Scotland, into which country it was introduced by cattle brought from Ireland; but by vigorous measures on the part of the local authorities the disease was speedily stamped out. In 1839 the disease was imported into England by some other agency than by living animals, because importations of animals had been prohibited for several years. The measures taken to combat the malady in Great Britain, though not sufficient to exterminate it, greatly miti-

gated its ravages. In 1881 there were 4,888 outbreaks and 183,000 animals affected; in 1882, 1,970 outbreaks and 87,950 animals affected. In July, 1888, the disease began to spread in the English counties, and it became a serious epidemic.

FORESTRY, the science and art of managing and developing trees in masses. It does not relate to single trees by themselves, but only as they are combined and constitute what we call a forest. It studies not only the general laws of tree-growth, which are the same everywhere, but also the peculiar nature or habit of each species, and the adaptations of different species to various soils, climates, and exposures. It considers the conditions which will best promote the growth of trees, whether for fuel, for timber, or for other purposes. It ascertains what trees grow best by themselves, and what thrive best in company with others. It falls within the province of forestry, therefore, to investigate whatever promotes or hinders the growth of trees, the causes of disease among them, the insects that prey upon them, and everything that may be an impediment to the development of the forest.

But forestry, as now understood, has a wider range than this even. It recognizes the connection of trees in masses with rain-fall and moisture, and with the distribution of the same and their consequent influence upon the atmosphere and upon the flow of streams. It therefore regards the forests as having an intimate connection with the interests of agriculture and commerce, as well as with climate, and consequently with health.

The subject of forestry has only recently begun to receive attention in this country, although it has long been known and recognized abroad. The first settlers of the country found it well wooded. From the St. John to Florida the whole sea-coast was fringed with trees, and as fast and as far as the settlers penetrated inland they found the trees abundant. Indeed, after the very earliest settlement, as the tide of immigration from the old country set in with increasing strength, the difficulty was to find open space enough for agricultural purposes, and a principal occupation of the settler, for a considerable time, was necessarily that of removing the trees. As there was then little use for the trees except for house-building and for fuel, they were felled and burned in huge piles upon the field, the stumps being left until a partial decay admitted of their removal. This process of settlement prevailed, for the most part, until within the memory of those now living, when the westward-moving column of migration emerged from the woods, through which it had almost literally hewn its way, and came out upon the prairies, which were almost destitute of trees, but most inviting to the tiller of the ground, partly on that very account.

That early and protracted struggle with the forests was not calculated to engender in the

people of this country a love of trees or a strong sense of their value. On the contrary, it cheapened them in their esteem, and made them ready to sacrifice them for slight reasons. We have parted with them freely, and for small considerations. Trespass upon woodland has not been regarded like trespass upon other lands, nor visited with similar punishment. We have suffered the fires, originating in carelessness, or set, as they have been sometimes, in wantonness, to waste the forests to the extent of millions of acres annually, and have made hardly any effort to prevent such destruction.

And when, by the growth of population and the development of the country, the forests became increasingly valuable for their lumber, we have produced this in a most careless and wasteful manner. The lumber-men have culled the largest and best trees, those that could be most easily and cheaply converted into lumber, and have used only the best portions of these even, leaving the larger limbs and often parts of the trunks themselves, with all the remaining trees of inferior size or less accessible, to decay or to be burned. As the result, we have hardly anywhere, unless it be in the Pacific region of the extreme Northwest, and in some portions of the Southern States, a remnant of the grand forests which once almost covered the land, while we have practically destroyed that magnificent belt of pines which stretched from Maine to the Mississippi.

Noah Webster, writing at the close of last century, on the supposed change in the temperature of winter, after examining many authorities, ancient and modern, advances the opinion that "the weather in modern winters is more inconstant than when the earth was covered with wood, at the first settlement of Europeans in the country; that the warm weather of autumn extends further into the winter months, and the cold weather of winter and spring encroaches upon the summer; that the wind being more variable, snow is less permanent, and perhaps the same remark may be applicable to the ice of the rivers." He attributes these changes to the exposure of the ground in consequence of clearings, and the greater depth to which the earth freezes in winters.

Dr. Rush, at about the same period, expresses the opinion that the springs were colder and the autumns milder than formerly, the rivers breaking up earlier in spring and freezing later.

Thomas Jefferson, distinguished for his habit of observation, says that the snows were neither so late nor so frequent as formerly, and intimates that the summers were longer, the autumns later, and the winters shorter and lighter than in former years. These changes, which were observed to follow the clearing of lands, were not gradual and slow, but quick and sudden, in proportion to the extent of cultivation.

Volney, the French traveler, who visited our country toward the close of last century, notes the fact that changes had been observed in the climate in proportion as the lands had been cleared. Kalm, also, who traveled in America in 1849, notices a supposed similar change of climate.

But the opinions of a few individuals, however worthy of consideration, were not calculated to make any marked impression upon the country, or to lead to any practical result.

In Europe the importance of the forests has long been recognized. As they were held for the most part as the property of kings and nobles, or of great ecclesiastical and municipal corporations, the mass of the people had only certain rights in them, or servitudes as they were called, such as that of gathering firewood, or leaves for bedding, or of pasturing cattle and swine in them at certain seasons. These rights were liable to constant abuse. The peasantry would cut trees for fuel without permission, or they would cut them for the purpose of enlarging the pasturage. In these and other ways the forests were preyed upon and destroyed. But they were often destroyed as the result of the frequent wars. They would be cut down or burned as the means of driving out an enemy concealed in them, or as a means of annoyance or reprisal. Sometimes kings and nobles, and even states, when in need of money, would sell their forests or portions of them.

It should be borne in mind, however, that in old English law and in the usage of older times the word "forest" had a different signification from what it has with us. A forest was a hunting-ground. It might have trees, or it might not. If it had, it was only incidentally, as affording shelter and rest for the game. Manwood, in his "Forest Laws," published about three hundred years ago, makes the essential characteristic of a forest that it is set apart for the conservation of game, and that if it have no game it can not be called a forest. It must also belong to a sovereign. A forest is a royal hunting-ground, and if the king makes a grant of a forest to a subject, it thereupon ceases to be a forest and becomes what is known as a "chase." Blackstone defines a forest thus: "Forests are waste grounds belonging to the king, replenished with all manner of chase or venery, which are under the king's protection for the sake of his recreation and delight."

Blount says that when William the Conqueror created what has ever since been known as the New Forest, for his recreation, as he was very fond of hunting, it "was raised by the destruction of twenty-two parish churches, and many villages and chapels and manors, for the space of thirty miles together." Only a small part of this extensive tract was covered with trees so as to be a forest in our modern understanding of the word.

At length it was seen that there must be a

diminished supply of fuel if dependence was to be placed upon the yearly growth of wood, and if not, then the utter extinction of the forests was threatened. It was found also that the removal of the forests from the slopes of the mountains gave rise to torrents, which carried rocks and stones into the fields and plains, and so covered them as to make them, in many cases, no longer capable of cultivation, and to oblige the inhabitants to remove. Floods and droughts were also found to be increasing.

Measures were then taken for the protection of forests, and in some of the European countries the authority and care of the government have been exercised in their behalf for several hundred years. It is more than two hundred years since the great Colbert, minister of Louis XIV, called the attention of that monarch to the dangers threatening France on account of the destruction of her forests. From the royal ordinance then issued, embodying severe laws against trespassers, dates the system of forest management and protection, which, with some changes, has continued in operation in France to the present time.

The system of forest protection in Germany dates further back, but has been much developed and improved within the past hundred years. Indeed, we may say that forestry has taken the position of a science and an art only within the present century. Inquiries and experiments, reaching through many years, have been made by most competent observers; laws of vegetable growth have been diligently investigated; the effects of climate, soil, and situation in other respects upon the growth of trees have been traced, and the effects in turn of trees upon the soil and climate, upon rain-fall and moisture. The mechanical effect of forests as barriers against harmful winds and as a protection to crops has been inquired into. These and many other things connected with tree-life and tree-growth have been made the subject of patient and scientific study.

It required but little examination to make manifest the connection of forests with rain-fall and water-supply as well as with floods and droughts. It had been noticed that, as the forests diminished, the volume of many streams, such as the Volga, the Po, the Rhine, and the Seine, were lessened, while also floods and droughts had become more frequent and torrents more destructive. Investigation showed that the leaves falling, from year to year, in the forests, and sheltered from the winds so that they are not dispersed, accumulate to a considerable depth, and, slowly decaying, form a covering of light, spongy soil, or humus, which is capable of absorbing the rains and snows. This spongy soil, in woods long undisturbed, is sometimes two or three feet in thickness. It is easy to see that such a mass would be able to hold a vast amount of water, and that the rains, instead of flowing off at once into the streams, would be detained for a time, trickling away gradually, as from a sponge, into the water-courses,

or, sinking slowly into the ground and following the seams and channels in the rocks, would come out as springs and rivulets in the distant meadows. So the streams and rivers do not rise and fall with every shower, but maintain an equable flow most serviceable to man.

The removal of the forests produces a great change in the water-flow. The first effect is to dry up the accumulated leafy soil by the influence of both sun and wind, which are now let in upon it. Thus, as the leaves dry, they are wafted away by the winds or washed away by the rains. The spongy soil being thus removed; the rains or snows have nothing to detain them, but flow at once down the hill-sides into the water-courses, filling them often beyond their capacity, overflowing their banks, and carrying destruction in their course.

For the same reason that the rains pour so quickly into the streams and cause sudden and destructive floods, in those seasons when the rains are not abundant, as in summer, there being no longer a great spongy surface upon the hill-sides, the streams are diminished, and many of them disappear for a time. The fields become parched, the cattle faint, the mills stand idle, and great loss and suffering are the result.

It is to be observed that the removal of the forests affects the water-supply of streams in another way. When ground which has previously been shaded by trees is opened to the sun and wind by their removal, the evaporation of moisture from the earth is greatly increased. Hence, much of the water which would otherwise sink into the ground and supply distant springs, or find its way into the streams, is now carried into the air as vapor. The streams, therefore, have a less average depth than they would have if the forests were not removed. The Rhine, the Elbe, and the Oder, it was stated at a Forestry Congress held in Vienna in 1878, are all shallower now than in the past. It was asserted that the Elbe at Altenbrücke, in Hanover, in 1787, was 48 feet in depth at low water. In 1812 it had decreased to 46 feet 6 inches; and in 1837 a further reduction to 38 feet was indicated, making a diminution of 10 feet in half a century. The Elbe rises in Bohemia, where, until recently, the forests were under no control, and so were destroyed in the most reckless manner. The Rhine, also, has much less water than formerly. Its sources are in Switzerland, where, more than in any other country of Europe, the forests have been considered common property, and their destruction has been most unrestrained. A similar lessening of such streams as the Connecticut, the Ohio, and the Hudson is noticeable in this country. These and many other streams no longer afford such facilities for commerce as formerly. Traffic upon them has to be carried on in smaller vessels than such as were formerly employed. The lesser streams, which were used extensively for manufacturing purposes, have also become so dimin-

ished in volume that, in many cases, the mills have been obliged to lessen their production or continue it only by the introduction of steam-power.

It has been a matter of dispute whether forests actually increase the amount of rain-fall in their vicinity. The preponderance of opinion favors the conclusion that they do, though the difficulty of making the necessary observations to settle the question is so great as to forbid at present a very positive opinion. So far as forests are on elevated ground—and they are so situated to a great extent—it would seem a reasonable conclusion that more moisture from passing clouds would be condensed by them and precipitated in the form of rain than would be converted into rain upon the open and lower ground. The simple law of attraction would tend to bring the clouds into contact with them, and their elevation would also cause them to intercept more or less the clouds driven toward them by the winds. Thus we might expect a greater deposition of moisture than on the lower and cleared ground; and in accordance with this, those who have paid but little attention to the operations of nature must have noticed how the clouds seem to cling around the mountains when elsewhere the sky is comparatively clear. Mr. Colvin, in charge of the Adirondack Survey, testifies that he has often found the trees there dripping with moisture condensed from passing clouds, when there was no such condensation outside of the forest limit. Careful and repeated observations also show an increasing amount of rain-fall as one goes from the level of Lake Champlain into the region of the Adirondaeks. This increase is proportioned to the elevation attained, and may be attributed in part to the forests and in part to elevation, as we know the temperature of the atmosphere decreases with elevation, and therefore the precipitation from the clouds is more copious on hills and mountains than on lower ground. But the precipitation is not to be attributed to elevation alone, for, in cases where cleared ground and forests have been on the same level, it has been found that more rain fell upon the forest than upon the open land.

But whatever may be thought as to the effect of forests in increasing the amount of rain-fall, there can be no doubt that they are great equalizers of temperature and moisture, and so have an important influence upon climate and upon the healthfulness as well as the agricultural capacity of the region where they are. No one can have visited a forest in the warm season without noticing its grateful coolness, and the moist condition of the air as compared with that of the open country. So, in the cooler season of the year, the atmosphere in the forest is warmer than that outside its limits. Lumber-men and wood-choppers find no difficulty in pursuing their work in the coldest weather. Travelers also experience great relief at once in very cold weather, whenever

they can get within the shelter of the forest. The ground never freezes in the woods as it does elsewhere. This is owing very much to the protecting cover of the fallen leaves, and to the snow. But the forests are also free from the winds. The most violent winds do not penetrate them, except for a very short distance. A tempest may be raging without, but stillness will reign in the depth of the woods. The trunks and branches of the trees form an effectual barrier against all but the most violent tornadoes, and even these seldom penetrate or damage dense and well-managed forests. The shelter is often equivalent to a favorable change of latitude of several degrees, so that certain plants and grains can be cultivated which could not be grown successfully without such protection. Thus forestry takes rank as one of the most important subjects of consideration. There is not one of the European states that does not now give prominence in its system of administration to its forests.

Where the forests are not owned by the state, the interest of the latter in such as are owned by individuals or corporations is held to be so great that the state maintains the right of supervision. While the proprietors are allowed usually to manage their forest property as they please, yet the state will not permit them to manage it in a way that may be prejudicial to the general welfare. No one, for example, is allowed to cut and remove an extensive tract of forest at once, if thereby the adjacent property of others would be injured, or if the danger of floods and torrents would be increased. The state here asserts its right of eminent domain and, if necessary, takes possession of the property. In general, however, there is now such a well-established and enlightened sense of the value of forests on the part of most owners of woodland in Europe, and such confidence in the wisdom and policy of the management of forests adopted by the governments, that they are usually disposed to adopt the same and to place their property under the control of officers appointed by the state.

The Bureau of Forests in France, and the Bureau of Forest Administration in Germany, are among the most important offices of government. They form a part of the Finance Department; for, while the forests are highly regarded for their climatic influences and their conservative effects, and on this account are carefully managed, they are at the same time so managed as to be made important sources of revenue. This is especially the case in Germany, where the economic value of the forests in their direct products is the chief consideration, as in France, owing to different geographical conditions, the relation of the forests to climate and soil-protection becomes the chief interest. In Germany the forests are so managed as to produce the largest and best growth of the most valuable kinds of trees upon a given space, while at the same time they are so arranged in position and form as

to exert the most conservative influence upon climate and upon the agricultural and other interests of the state. The Germans have studied the whole subject of tree-growth in all its relations, with the utmost care, and the result is that they are able to grow three times as much timber on an acre of ground as our natural forests produce, and at the same time of better quality. The management of a forest by them is like that of one of our market-gardens compared with an ordinary farm-field. The ground is well chosen, if a new forest is to be created, or, if it is already occupied with forest-trees, it is put into the best condition to produce the largest crop. Drains are made if necessary. If the ground is not well stocked with trees, the vacant spaces are filled. If the trees are of inferior character, they are replaced as soon as possible by better ones. If improper or uncongenial trees are growing together, measures are taken, by removal and planting, to produce a proper association, so that they shall grow in harmony and without interference with one another. The sickly are replaced by such as are strong. The deformed have their habit corrected by proper pruning, or are made to give place to others. Thinnings are made at the proper time so as to admit the requisite amount of light and air to promote the most rapid and healthy growth, and to secure the proper seeding of the ground for a future crop; and finally, the trees are cut down and converted into fuel or lumber when they have attained the condition to be most valuable for these uses. Dead trees are not allowed to cumber the ground, and living trees are not permitted to remain after they have attained their growth and have ripened their wood.

Then, in reducing the forest to use, similar care is exercised. In felling the trees, caution is taken not to injure the young trees which are designed to continue the forest. Roads and canals are made to facilitate the conveyance of the timber or fuel. All the operations are performed by the agents of the government or under their constant supervision.

Germany not only produces all the lumber and fuel she needs for her own use, but is able to export a considerable quantity. And this is done from the annual yield of her forests, without trenching at all upon the substance of the forests as such. Indeed, we are told that the tendency is to increase the amount of land devoted to forests.

The management of forests in France is similar to that in Germany, which may be regarded as the system adopted substantially in all the European states. It is modified somewhat by the greater need in France of studying climatic effects.

Everywhere, in the European system, the forest tracts are carefully surveyed and mapped. Then a period of rotation is fixed—that is, the time when the trees are expected to reach their full growth and give place to their suc-

cessors. This differs according to the kinds of trees grown. With the larch and birch it ranges from fifty to sixty years, and in cold regions twice that. With the locust and maritime pines, it is from sixty to seventy years; with the Scotch pine, it is from eighty to ninety; with the beech, from eighty to one hundred and forty; with the ash, from ninety to one hundred; with the chestnut, from ninety to one hundred and twenty; with the spruce, from ninety to one hundred and forty; with the fir, from one hundred to one hundred and forty, the average being about one hundred and twenty years; with the elm, from one hundred to one hundred and twenty years; and with the oak, from one hundred and twenty to two hundred. To prevent cutting off large tracts at once, and so making openings through which violent winds might gain admission, the forests are divided into blocks, only one of which is cut at a time. Of course, a first principle of any such system of forestry is the exclusion of all cattle from the forests, except where the trees are of such size as to be in no danger either from their teeth or their hoofs.

We know nothing practically of such forest management in this country. The growth of forests is only accidental and hap-hazard, and our use of them has been most wasteful and uneconomical. Cattle have been allowed free range in them, and the young trees have been eaten or broken down to such an extent that, except with the primitive growth, our forests have contained only a comparatively small number of trees, and these, on account of the wide spaces often left between them and for want of proper care, have become trees of inferior character.

To secure a class of persons competent to manage forests as they are managed in Europe, it is necessary that they should be trained for the work. Accordingly, there have been established in nearly every European country what are known as schools of forestry. With us they would be called colleges. There are nine of them in the German Empire alone, having a course of instruction varying from two years to two and a half in length. The complete and scientific character of the European forestry system will appear from a schedule of the scheme of instruction. We give, therefore, that of one of these schools, which may be fairly taken as an example of all. In this the course is two and a half years in extent. The system of instruction is divided into fundamental sciences, principal sciences, and secondary sciences. In the first are embraced general and theoretic chemistry, special inorganic and organic chemistry, applied physics and meteorology, mineralogy and geology, botany in general and forest botany in particular; microscopy, general zoology, with zoological excursions; geodesy, interest and rent account, wood-measuring, surveying and leveling, plan-drawing, and public economy and

finances. Under the principal sciences are embraced cultivation of forests, forest implements, protection of forests, forest technology, forest surveying, appraising forests, calculation of the value of forests and forest statistics, administration of forests and hunting, redemption of rights of usage, forest history, and forest excursions. Under the third division are included civil and criminal law and jurisprudence, construction of roads, hunting and shooting exercises.

Five hours and a half daily are given to lectures on these and some subsidiary subjects, and as much more time to the study of these subjects in private.

A considerable amount of preliminary study is requisite as a condition of admission. Capt. Campbell Walker, of the English Forestry Service in India, was commissioned several years ago by the British Government to visit the German schools for the benefit of the Indian Service, and in his report he says:

Nothing struck me as more remarkable than the extent and varied nature of the studies required from forest candidates or probationers in Prussia, and the number of years they are content to spend, first in studying and then in waiting for an appointment. The would-be Oberförster, which is the lowest of what we would call the "gazetted appointments," must, after passing certain terms at a Government school of the first class, spend a year with an "Oberförster" (over-forester) in a Revier (district or section of the forest), and then pass an examination as forest pupil, after which there is a two [two and a half] years' course at a forest academy and an examination in scientific forestry, land-surveying, etc., on passing which the pupil becomes a "Först-Kandidat"; then another two years' practical study, during at least nine months of which he must actually perform the duties of a forester; after which comes the final Government examination, on passing which he enters the grade of Oberförster-Kandidat. The difference between the two examinations is explained to be that the first tests the candidate's knowledge of theoretical forestry and cognate sciences, while the latter tests his ability to apply what he has learned and capability for employment as Oberförster and in the higher grades.

After passing the final examination, the "Oberförster-Kandidat" is employed as an assistant in the academies and control-offices, in making forest-surveys and working plans, and sometimes acting in charge of a Revier, receiving certain daily or weekly allowances while so employed. After five or six years of this probation, he may look forward to being permanently appointed.

Thus we have at least five years spent in study, and another five in probation; the former without any pay, and the latter only with meager allowances, while actually employed, before the would-be forest-officer is installed, and the time is generally much longer. Yet so great is the desire for Government service, and particularly forest service, in Prussia and in Germany generally, that there is no lack of competitors.

Positions in the forestry service are permanent and are considered highly honorable, being often sought by persons of rank. Capt. Campbell says again:

Nothing that I can say or write can convey too high an idea of the attainments and thorough knowledge of their work possessed by German forest officers of all grades. A very little time served to convince me that the practice of the German foresters was as good as,

if not better than their theory, and that they were in fact perfect masters of their duties in all their details. An Oberförster, and even many of the Försters and overseers, can tell the name, local and botanical, of every tree, shrub, and plant, classify it, and state its uses; name and classify every beetle and insect in the forest, and know whether they are harmless or destructive to trees, in what shape they do damage, and what are the best known preventive measures; inform you of the nature of the soil, and to what period the formation belongs; what trees will grow best, and why. All this is known thoroughly, theoretically, and practically.

Then as to the Revier (section), the exact yield, rate of growth, and annual increase in value of each block is thoroughly known and can be put down at any moment in figures by the Oberförster, who can tell at the commencement of each year how much timber he is going to cut and sell, and from what parts of the forest it is to come, how many acres have to be partially cleared for natural reproduction, planted, sown, thinned, or planted up. The mere details of all this are left, as a rule, entirely to the subordinates, who thoroughly understand them.

Such is the system of forestry established throughout Europe. The governments there, without exception, guard their forests with jealous solicitude, and the people, to a great extent, have a corresponding regard for them, and sense of their value. Schools of forestry are established from Spain to Finland, and instruction on the subject is carried in some countries into the common schools. The United States Government, though possessing in its forests a property more valuable a hundred-fold than all its mines, has never counted them as of any worth. They have hardly been considered in connection with the public lands, which have been sold at a merely nominal price, and oftener have been given away to great corporations or whoever almost would take them. As a source of revenue, the forests have never been taken into account, while Prussia, with a forest area not exceeding the area of the single State of Indiana, receives an annual income of \$6,000,000 above all her expenses of management. Our forests have not, probably, returned to the Government the cost of surveying them, if we can be said to have surveyed them at all. Trees which had been growing from one hundred to five hundred years have been cut down as though they were but mushrooms, and no provision has been made to replace them. The forests, that stood as sentinels to guard the streams of commerce and manufacturing industry and to insure fertility to our fields, we have swept away recklessly. Thus it has come to pass that we are beginning to suffer great evils, and greater are threatening us. The character of our streams, in many parts of the country, has been greatly changed. The amount of water flowing in them has lessened or made fitful, and therefore lessened for all practical uses. We have floods and droughts where formerly the rivers were regular in their flow.

We have come to a point where the subject of forestry becomes one of great practical importance, and though we differ so much, in some respects, from the people of Europe, here

is a subject in regard to which we can take most valuable lessons from them. Whether forests actually increase the amount of rainfall may still, possibly, be matter of question. But the favorable action of masses of trees upon health and comfort, and their influence in protecting crops from injury, and thereby increasing the returns of the husbandman—in regard to this there can be no longer ground for debate.

It has been estimated by careful and scientific observers that the earth is in the best condition to subserve human welfare and comfort only as about a fourth part of the land is in a wooded state. The proportion may be allowed to vary from this somewhat, according to peculiarity of situation. England, for example, in a cool, northern latitude and surrounded by water, has such a moist atmosphere that she requires but a small forest area as compared with warmer and inland countries. The forest areas of various European countries, as given by the most recent official statistics, are as follow :

COUNTRIES.	Acres of forests.	Per cent. of area.
Russia.....	476,710,000 }	40·0
Finland.....	27,170,000 }	
Sweden.....	43,395,480 }	34·1
Norway.....	18,920,509 }	
Austria.....	43,300,411	29·4
Germany.....	84,969,791	26·1
Turkey.....	20,568,280 }	22·9
Roumania.....	4,940,000 }	
Italy.....	14,233,975	22·0
Switzerland..	1,738,736	18·0
France.....	22,667,716	17·8
Greece.....	1,721,029	14·3
Spain.....	7,838,647	7·8
Belgium.....	501,402	7·0
Holland.....	569,160	7·0
Portugal.....	1,165,420	5·1
Great Britain.	3,106,824	4·1
Denmark.....	464,860	3·4
Total.....	725,985,743	29·5

It will be seen from this table that Europe, taken together, has now a sufficient proportion of woodland, and that it is fairly distributed according to the special situation and needs of the different countries. Spain is probably suffering most from lack of forests. Russia is well wooded only in the northern portion, and in Sweden and Norway the forests are being cut off so rapidly, for exportation, as to cause alarm.

The forest area of the United States is large enough in itself, but it is unevenly distributed. The northern portion, originally well wooded, and with that most valuable lumber-tree the white pine, has so far been denuded that serious results have already followed. The southern portion of the country is still heavily timbered, and much of its wooded area might be taken for agricultural purposes without disadvantage to any interest, if a proper selection could be made. But already extensive inroads have been made upon the forests of the South, and the process of destruction is going on with rapidity and carelessness. In

the western portion of the country, with the exception of the Pacific coast-region, there is a great scarcity of forests. There is the greatest need of husbanding what trees are to be found here, and of planting extensively on the prairies and on other sections which are destitute, or nearly so, of any tree-growth. Yet it is on this comparatively treeless region that the trees are being destroyed most recklessly. Much of the agricultural land can be cultivated profitably only by means of irrigation. But the destruction of the forests is continually lessening the supply of water in the streams upon which irrigation depends.

It is in this part of the country that the lands still owned by the Government are principally situated, and the best as well as the most desirable opportunity is offered to put in operation an effective system of forestry. The Government and great corporations are specially adapted to put in operation and carry on such a system of forestry as is needed. Those who hold only small parcels of land can not, if they would, establish a proper system. And where there are small tracts of woodland already existing, or if any shall be planted by individual landholders, there is no certainty that they will not be destroyed at any time.

We have taken a step in the right direction in establishing the Yellowstone National Park in Wyoming; and the President, in his last message, recommended that other portions of our woodlands, in which are the head-waters of some of our principal streams, should be preserved in their forest condition. We may well go further than this. Why should not the Government preserve all or nearly all its remaining woodlands, withdrawing them from sale at least until it can be ascertained, by careful and adequate examination, what portion is needed for agricultural use and can be spared for that purpose, then maintaining the rest in forest condition for the perpetual benefit of the country, and drawing from it at the same time a perpetual revenue?

The separate States, so far as they still possess lands, might well pursue a like course, and, where they have none, might encourage the landholders to engage in forest-planting. The establishment in some of our Western States of Arbor-Day, or tree-planting day, has been attended with the happiest results. It has already occasioned the planting of many millions of trees. There are in many, if not in most, of the States, considerable portions of land unfit for agricultural purposes, but which would be remunerative if occupied with trees. Most mountain-slopes and high hills are of this sort, as are many tracts of stony and swampy land on lower situations. The State might offer premiums for the best plantations of trees on such ground, or might exempt forest plantations from taxation for a certain number of years, until they should begin to yield an income from thinnings. As auxiliary to this, experiment stations would naturally be estab-

lished, where, under competent directors, various methods of tree-planting and culture would be tried, and different kinds of trees would be planted, and their adaptations to soil and climate tested, and thus their comparative merits ascertained.

At such experiment stations would naturally be trained up a class of men who would be qualified to be intrusted with the management of the public forests. In process of time, with the establishment of a proper forestry system, there would come into being forestry schools, essentially like those of Europe, though modified by our peculiar circumstances.

The history of forestry in this country is briefly this. A few examples of the cultivation of forest-trees are to be found reaching back as far as a hundred years. But about forty years ago, the Messrs. Fay made the experiment of planting between 300 and 400 acres of poor stony or sandy land in Eastern Massachusetts with forest-trees. A few others have followed their example, and reclaimed in this way considerable tracts of the worthless sand-barrens of Cape Cod. Occasional plantings on a smaller scale have been made elsewhere, but it is only within a few years that the trees on the earliest of these plantations have reached a stature to show the result of the experiments, or call attention to them. Most of these experiments have been successful and encouraging.

About twenty years ago, the late Hon. George P. Marsh, who had long been a resident abroad as the representative of this country in European states, published "The Earth and Man, or Physical Geography as modified by Human Action." One of its longest chapters was devoted to a discussion of the subject of forests and their influence. His work, a later edition of which bears the title "Man and Nature," is the best treatise on the subject in the English language, and is constantly referred to as an accepted authority even by writers in Germany and France, where the literature of forestry is very voluminous.

Ten years subsequent to the publication of Mr. Marsh's book, the subject of forestry was taken into consideration by the American Association for the Advancement of Science, and a memorial was sent by that body to Congress, calling attention to the rapid destruction of our forests and the dangers threatening the country in consequence, and asking for some appropriate legislation on the subject. In 1876 Congress directed the Commissioner of Agriculture to ascertain the facts in regard to our forests, the best means of preserving and renewing them, the influence of forests upon climate, and the system of forest management in use in other countries. As the result of this action, agents have been employed by the Department of Agriculture in making investigations, and their reports have been published. These reports contain a large mass of information, and have been widely distributed.

A Forestry Association was also formed a few years ago, which, in 1882, was merged in a Forestry Congress, instituted at that time. This body, composed of persons in this country, and also in Canada, who are interested in forestry, has held three sessions, the last of which was at St. Paul, in August, 1888. Papers relating to forestry were read, and discussions ensued. The discussions and recommendations have been widely published, and have led to important legislative action in several of our own States and in the Dominion of Canada. During the past year a State Forestry Association has been formed in Ohio, and measures have been taken to establish experiment stations in that State. Commissioners of forestry have also been appointed in several of the States, and instruction in forestry is given in connection with some of the agricultural colleges.

But perhaps the most important indication of an awakened interest in forestry is seen in the recent movement for the preservation of the great Adirondack forests in New York. Mr. Marsh, in his book already alluded to, called attention to these forests, and urged the importance of their preservation, in order to maintain the proper flow of that great highway of commerce, the Hudson river, as well as on other accounts. But his words were unheeded, or, if heeded, they resulted in no efficient action until recently. But at last public attention has been aroused to such an extent that the Legislature of the State made a small appropriation a year ago for the purchase of a portion of the Adirondack lands with a view to reclothing them with forests. More recently a movement has been made, led by the Chamber of Commerce of New York, designed to secure further legislation on the subject, and an appropriation sufficient to purchase such an amount of land as, in connection with what the State now owns, will insure the protection of the head-springs of the Hudson and other important streams.

Forestry is receiving increased attention also in Great Britain, on account of its bearings upon her Indian and Australian possessions. The destruction of the forests there has gone on with alarming rapidity. India has actually imported railroad-ties from Norway and Sweden, because her accessible forests had been stripped of the proper timber for such use. The attention of the British Government has been aroused by this condition of things, and measures have been taken for the preservation of the remaining forests and the planting of new ones. Though having no forest schools of her own in which to train up persons competent to direct the management of forests, the Government for several years has sent a number of pupils annually to the French and German schools, to be trained for the Indian and Colonial service. The reports for the past year show a very encouraging condition of the forests both in India and Australia. Large

areas have been placed under efficient protection, and considerable tracts of denuded land have been planted. Quite recently instruction in forestry has begun to be given in connection with one of the schools of technology in London, and there is some prospect of the establishment of a forestry-school in England.

FRANCE, a republic in Western Europe. The republic was proclaimed Sept. 4, 1870. The Constitution was adopted Feb. 25, 1875, by the National Assembly elected in 1871. The Chamber of Deputies is elected by universal suffrage under the *scrutin d'arrondissement*, which was adopted Nov. 11, 1875. Each *arrondissement* is represented by a deputy, and, if its population is in excess of 100,000, by additional deputies for each 100,000 or part of 100,000 beyond that number. The number of electors in 1881 was 10,179,845. The number of deputies is 557. The Senate is composed of 800 members, 75 of whom are chosen for life, the Senate electing the successors of deceased members. The remaining 225 are elected, 75 every three years, by the departments and provinces. They are chosen by senatorial electors, elected to represent each of the communes and municipalities, together with the members of the Council General and the deputies of the department, who possess votes *ex officio*. The Chamber of Deputies is elected for four years. The National Assembly meets annually on the second Tuesday in January, and must remain in session five months. The President of the Republic can call an extraordinary session, and is compelled to do so if one half of the members of each Chamber unite in demanding it. The two Chambers possess equal and concurrent powers of legislation; but all financial measures must originate in the Chamber of Deputies. The executive head of the republic is the President, who is elected for the term of seven years by a majority of the deputies and senators in joint session. The President has the disposal of the military forces, makes all appointments, civil and military, and can propose legislation; but all acts must be countersigned by the ministers, who are appointed by the President, and are responsible to the Chambers.

The Government.—The President of the Republic is François P. Jules Grévy, born in 1813, who was a member of the Constituent Assembly of 1848, President of the Assembly from 1871 to 1873, and President of the Chamber of Deputies from 1876 to 1879; elected January 30, 1879.

The Cabinet, appointed February 21st, is composed as follows:

President of the Council and Minister of Public Instruction, Jules Ferry, who was born at Paris in 1823, admitted to the bar in 1848, member of the Government of National Defense (1870-'71), Prefect of the Seine Department (1871-'72), Ambassador to Greece (1872-'73), Minister of Public Instruction and Fine Arts (1873-'80), President of the Council (1880

'81), and Minister of Public Instruction in 1882.

Minister of Foreign Affairs, Paul Amand Challemel-Lacour, born in 1827, Professor of Philosophy at Pau and Limoges (1849-'51), expelled from France in 1852, returned in 1859, Prefect of Rhône and *Commissaire* of the Republic (1870), delegate to the National Assembly (1872), Senator (1876), Ambassador to Switzerland (1879-'80), to England (1880-'82).

Minister of the Interior, Pierre Marie Waldeck-Rousseau, born in 1846, advocate, deputy since 1879, Minister of the Interior in Gambetta's ministry.

Minister of Finance, P. Paul Emmanuel Tirard, incumbent in the two preceding ministries, born in 1826, engineer and merchant, Minister of Commerce (1879-'81), reappointed Jan. 31, 1882; appointed Minister of Finance Aug. 7, 1882.

Minister of Justice, Félix Martin Feuillée, born in 1830, deputy since 1876, Under-Secretary of the Interior in 1879, and of Justice in December, 1879.

Minister of Commerce, Anne Charles Hérisson, born in 1831, advocate, deputy (1878), held over from the Duclerc Cabinet.

Minister of Agriculture, Félix Jules Méline, born in 1838, lawyer, deputy in 1872 and 1876, Under-Secretary of the Interior in 1879.

Minister of War, Gen. Thibaudin, entered the army in 1843, lieutenant-colonel of cavalry (1868), brigadier-general (1877), general of division (1880), appointed Jan. 31, 1883.

Minister of Marine and the Colonies, Charles Marie Brun, born in 1821, engineer by profession, Director of Naval Construction (1875), elected deputy (1871), senator (1876).

Minister of Posts and Telegraphs, Louis Cochery, born in 1830, Under-Secretary in the Ministry of Finance (1873-'79), first appointed Feb. 5, 1879.

Minister of Public Works, David Raynal, born in 1840, deputy (1876), Under-Secretary of Public Works (1880), head of the same ministry in the Gambetta Cabinet (1881).

In August M. Brun resigned on account of ill-health, and was succeeded by Admiral Peyron, Maritime Prefect of Toulon.

In October Gen. Thibaudin handed over his portfolio to Gen. Campenon. The latter was a staff officer at the time of the *coup d'état*, and was exiled for his republican opinions. He went to Tunis and reorganized the army of the Bey, but returned soon to France and served in Algeria, in Italy, and in China. He was Minister of War under Gambetta.

Area and Population.—The area of France is 528,572 square kilometres. The population returned in the census of 1881 was 37,672,048. In 34 of the 87 departments there was a decrease in population between 1876 and 1881, attributed to a decline in the number of marriages. The excess of births over deaths in France amounted to 280,000 per annum between 1820 and 1830, falling to 51,200 between

1850 and 1860, and after a slight recovery declining again to 84,206 in 1869. In 1870 there was an excess of deaths amounting to 103,894, and in 1871 to 444,889, succeeded by a surplus of births amounting to 172,987 in 1872, and continuing in the following years.

The number of foreigners in France increased from 379,289 in 1851 to 1,001,110 in 1881. The Belgians increased from 128,103 in 1851 to 374,498 in 1876; the Italians, from 76,539 to 165,318; the Swiss, from 25,485 to 50,208; the English, from 20,357 to 80,077; 545,495 of the foreign population resided in Paris, Marseilles, and in the district of Lille.

In 1872 98 per cent. of the population were Catholics, 1·6 per cent. Protestants, 0·14 per cent. Israelites, and 0·23 of no declared faith.

The division of the population into professional classes was as follows in 1881:

OCCUPATION.	Number.
Agriculture.....	13,204,799
Industry.....	9,524,107
Commerce.....	3,843,447
Transportation and navigation.....	803,741
Public service.....	552,851
Liberal professions.....	1,629,769
Living on their incomes.....	2,143,178
Of no profession.....	727,533
Occupation unknown.....	173,816
Total.....	37,405,290

Algeria.—The area of Algeria is 667,065 square kilometres; that of the three departments of Algiers, Oran, and Constantine, 318,384 square kilometres. The population in 1881 was 3,310,412, or 10 per square kilometre of the three departments. The population comprised 233,937 French, 35,665 naturalized Israelites, 2,850,866 native Mussulmans, and 189,944 foreigners; of the latter number 114,320 were Spaniards, 33,693 Italians, 15,402 English and Maltese, 4,201 Germans, and 22,828 of other nationalities. The population of the principal towns in 1881 was as follows: Algiers, 70,747; Oran, 53,530; Constantine, 33,379; Bône, 21,974; Tlemçen, 18,376; Philippeville, 15,580.

The net immigration in 1880 was 17,436; in 1879, 23,804.

In the budget for 1879 the total receipts are stated as 37,181,872 francs, and the total expenditures as 35,630,590.

The returns of the general commerce in 1879 give the imports as 272,100,000 francs, of which 184,400,000 francs came from France, 13,927,000 francs from the Barbary states, 8,249,000 francs from Spain, and 6,610,000 francs from England. The exports were returned as 151,900,000 francs in amount, of which 123,838,000 francs went to France, 17,875,000 francs to Spain, and 13,516,000 francs to England. Natural products constituted 66,448,000 francs of the total value of imports and 136,961,000 francs of the exports; manufactured articles, 236,987,000 francs of the imports and 31,874,000 francs of the exports.

The railroad mileage in the beginning of 1883 was 1,581 kilometres, besides 206 kilometres in Tunisian territory and 40 kilometres of industrial lines. The receipts in 1880 were

12,139,439 francs; in 1881, 14,475,852 francs; in 1882, 16,405,552 francs.

The length of telegraph lines in 1882 was 5,832 kilometres; of wires, 13,885 kilometres.

In order to procure land for the colonization of Algeria by a European population, which will give security to the French dominion and develop the agricultural resources of the country, the Government has been obliged to proceed to the expropriation of the tribal lands of the nomadic Arabs and a part of those of the sheep-growing Kabyles of the mountains. Critics of the Government complain that the proceeding is a breach of the capitulations of 1830, which insured the preservation of property-rights as well as religious protection to the native Mohammedans. It is not intended to take the lands without compensation, nor to reduce the grazing-lands of the nomads below the limits of their own requirements. The scheme was postponed by the vote of the Chamber in the final action on the budget.

Tunis.—A French protectorate was instituted over the regency of Tunis by the treaty of Kasr-el-Said, signed May 12, 1881. The decrees of April 22, 1882, for the enforcement of the treaty provide that the different ministries in France shall control the corresponding services in Tunisia, imparting their instructions to the resident minister in Tunis through the medium of the Bureau of Tunisian Affairs, after first communicating them to the Minister of Foreign Affairs, who examines them with regard to their effect on international relations.

The reigning Bey is Sidi Ali Pasha, who succeeded his brother, Mohammed-es-Sadok, Oct. 28, 1882. His Prime Minister is Mohammed Khasnadar. The French Minister Resident is P. Cambon.

The area of Tunisia is about 116,348 square kilometres. The population is about 2,100,000, of whom 45,000 are Israelites, 25,100 Catholics, 500 Greek Catholics and Protestants, and the rest Mohammedans. The capital, Tunis, contains 125,000 inhabitants.

The budget for 1874-'75 provided 5,577,625 francs for the service of the public debt, and only 151,325 francs for the general administration of the Government. The foreign debt was reduced to about 125,000,000 francs by the European Financial Commission, which was charged with the complete administration of the finances. The Bey engaged to reserve certain revenues, notably those of the customs, for the payment of the interest and eventual extinction of the debt. The revenue was augmented by increasing the general tariff on imports in June, 1872, from 3 to 8 per cent. The French, after the occupation, did not interfere with the Finance Commission, which has been working since 1869. But in 1883 a convention with the Bey was ratified, whereby the financial administration should be transferred to France, and the public debt guaranteed by her. England withdrew her objections. Taxes have been collected more efficiently under

French supervision than under native rule. The revenue and expenditure are reported in a statement of the president to have been for the year ending with June, 1882, 12,562,750 and 9,760,000 francs respectively. Of the expenditure the interest and administration of the debt are given as 7,530,100 francs. The cost of the general administration of the country is stated at about 1,750,000 francs more than before the occupation. The cost of maintaining the French army of occupation is given in an extraordinary budget as 1,500,000 francs. The expense is borne partly by Tunis and partly by the French Government.

The Bey has a regular army of 2,000 or 3,000 men and an irregular army of some 10,000, comprising 3,000 *Karouglis*, the descendants of the Turkish Janizaries, 5,000 *zouaves*, 1,500 mounted *spahis*, and 500 *gendarmes*. The army is deplorably equipped. The French have organized twelve mixed companies, half of French and half of native soldiers.

The French army of occupation numbers 11,000 infantry, 1,600 cavalry, and 800 artillery with 12 batteries.

The foreign commerce is carried on mainly with Italy, France, and Great Britain. The imports average about \$5,500,000, the exports \$6,500,000. The chief articles of export are

alfa, or Esparto-grass, for making paper, which is shipped largely to Great Britain, and olive-oil; after which come olives, sponges, legumes, wool, cattle, salted fish, dates, fezes, wax, etc. There were about 166 miles of railroad and 600 miles of telegraphs July 1, 1882.

The administration of the country is practically under the direction of the French resident, or *chargé d'affaires*. The French Government appointed numerous commissioners to examine into the various details of the administration and devise plans of improvement. The country is divided into twenty-two sections, each of which is under the command of a French military officer. In August, 1882, French judges were appointed to supersede the consular courts, but before they could enter upon their functions the consent of the great powers to the abrogation of the capitulations was necessary. Great Britain objected, but after the Egyptian occupation consented, in 1883.

The Colonies.—The statistics of the other colonies and protectorates of France are summarized in the following table, giving their area in square kilometres, population, the value of their foreign commerce in 1880 in thousands of francs, and their budgets, as far as reported, for 1882, in thousands of francs:

COLONIES.	Area.	Population.	Imports.	Exports.	Budgets.
ASIA :					
French India.....	508	258,022 (1880)	5,847	7,658	1,721
Cochin China.....	59,458	1,250,497 (1880)	40,197	51,610	16,568
Cambodia.....	88,361	1,500,000
AFRICA :					
Senegambia.....	250,000	192,924 (1879)	16,488	25,349	2,256
Gold Coast and Gaboon.....	2,800	3,000	7,000	1,412
Réunion.....	2,511	180,814 (1880)	85,499	28,572	4,950
Mayotte.....	246	1,118	2,278	941
Nossi Bé.....	298	8,155 (1890)	2,269	6,416	229
Ste.-Marie de Madagascar.....		7,177 (1880)	183	110
AMERICA :					
Guiana, or Cayenne.....	121,418	27,833 (1880)	7,987	607	1,811
Martinique.....	987	164,100 (1880)	24,775	28,546	8,853
Guadeloupe and dependencies.....	1,570	192,735 (1880)	23,542	27,216	4,625
St.-Pierre and Miquelon.....	235	4,916 (1880)	9,159	11,725	298
OCEANIA :					
New Caledonia and dependencies.....	19,950	68,584 (1881)	7,904	2,757	1,915
Tahiti and dependencies.....	8,653	25,247 (1881)	3,163	3,243	1,000

The subventions from the French Government amounted to 1,253,000 francs, leaving 87,799,000 francs as the total revenue raised in the colonies. If the total colonial budget of 80,696,000 francs and credits entered in the naval budget are added, the total colonial expenditures amounted to 98,495,000 francs. The total area of the colonies and protectorates, exclusive of Algeria and Tunisia, is 547,912 square kilometres; their population, 4,222,654.

The tonnage entered at French ports in 1882 was 12,448,885, 4,024,296 French and 8,424,089 foreign, as against 11,882,471 tons, 3,919,562 French and 7,962,909 foreign, in 1881; tonnage cleared, 7,852,615, 3,577,567 of French and 4,275,048 of foreign registry, as against 7,539,022 tons, 3,354,915 French and 4,184,107 foreign, in 1881.

The number of vessels, tonnage, and number of crews in the French merchant marine at the beginning of 1881 were as follow :

VESSELS IN—	Number.	Tonnage.	Crews.
Fisheries.....	9,987	134,988	54,928
Coast trade.....	2,399	111,069	9,654
Ocean commerce.....	1,743	648,406	24,543
Post-service and yachts.....	929	29,810	3,973
Steam.....	652	277,759	12,564
Sail.....	14,406	641,589	79,588
Total, 1880.....	15,058	919,298	92,897
Total, 1879.....	15,083	982,358	94,183

Commerce.—The following table exhibits the annual value of the special commerce from 1877 to 1882, and the average for the three decennial periods preceding, in millions of francs and tenths of millions:

YEAR.	Special imports.	Special exports.
1882.....	4,973·1	3,596·2
1881.....	4,946·4	3,612·4
1880.....	5,088·2	3,467·9
1879.....	4,505·2	3,281·8
1878.....	4,176·2	3,179·7
1877.....	3,869·8	3,436·8
1867-76.....	3,407·5	3,306·4
1857-66.....	3,200·5	2,430·1
1847-56.....	1,071·1	1,223·7

The total value of the general imports in 1879 was 5,579,300,000 francs; of the general exports, 4,269,600,000 francs. The general commerce of 1882, which includes the transit trade and goods imported for re-exporting free of duty, amounted to 2,070,099,000 francs, an increase of 1,100,000 francs, as compared with 1881.

The imports and exports of specie from 1877 to 1882 were, in millions and tenths, as follow:

YEAR.	Imports.	Exports.
1882.....	411·8	349·9
1881.....	363·2	302·2
1880.....	395·9	470·2
1879.....	353	434
1878.....	543	189
1877.....	683	143

The participation of the principal commercial countries in the special commerce of the year 1880 was as follows, in millions of francs and tenths of millions:

COUNTRIES.	Special imports.	Special exports.
Great Britain.....	668·5	910·6
United States.....	731·0	332·1
Belgium.....	457·4	465·0
Germany.....	483·2	362·9
Italy.....	398·8	151·3
Spain.....	343·2	153·7
Russia.....	314·1	34·0
Switzerland.....	115·1	230·4
Argentine Republic.....	148·9	34·6
Turkey.....	188·5	45·5
Austria.....	124·1	22·5
Brazil.....	52·4	76·3
Other European countries.....	223·7	105·4
Other American countries.....	139·2	157·1
Asia, countries in.....	313·5	17·0
Africa, countries in.....	124·2	60·1
Other foreign countries.....	23·4	8·9
Algeria.....	126·9	161·8
Other French colonies.....	117·6	57·8
Total commerce, 1880.....	5,032·2	3,467·9

The following table presents the exports and imports of 1881 and 1882, classified according to the nature of the products, in millions of francs and tenths thereof:

CLASSES OF COMMODITIES.	1881.		1882.	
	Imports.	Exports.	Imports.	Exports.
Articles of consumption.....	1,918·1	917·7	1,901·6	918·2
Raw materials.....	1,851·8	646·7	1,907·7	663·4
Manufactured articles.....	508·4	1,854·1	583·6	1,670·9
Miscellaneous products.....	560·6	343·0	530·2	343·6
Total merchandise.....	4,838·4	3,561·5	4,979·0	3,536·1
Precious metals.....	363·6	302·1	411·3	349·9
Total special commerce.....	5,227·0	3,863·6	5,383·3	3,946·0

In the first class the imports of cereals amounted in 1882 to 596 millions, against 574½ millions in 1881, the exports to 100½, against 131 millions; fermented drinks were imported to the value of 399, against 406 millions, and exported to the value of 325½, against 329 millions; the net imports of tobacco were 25, against 27½ millions in value; of seeds, fruits, etc., 155, against 175½ millions; of animals and animal food products, 86½, against 126½ millions. In the class of raw materials, the imports of fuel amounted to 183, against 173 million francs; of raw metals, to 136, against 133 millions; of skins, hair, and leathers, to 224½, against 215 millions, and the exports to 218, against 203 millions; of textile materials, to 936½, against 1,032½ millions, and exports to 378½, against 377 millions; of timber, etc., to 235, against 241 millions. The increase in the value of manufactured articles imported was principally in machinery and metals and in yarns. The exports of pottery and glass were 40½, against 39½ millions in value; of machinery and metal manufactures, 151, against 146½ millions; of leather manufactures, nearly 180, against 179 millions; of yarns, about 48 millions in both years; of textile fabrics, clothing, etc., nearly 904½, against 817½ millions; of paper and paper manufactures, about 25 millions in both years; of wood and straw products, about 43, against 53 millions; of jewelry and works of art, 241, against 300 millions; of books, etc., 24½, against 28 millions.

The exports for the first eight months of 1883 showed a falling off of 32 millions as compared with the same period in 1882, while the imports showed an increase of 112 million francs. There was an increased importation of articles of food and a continued increase in the imports of raw stuffs, plant, and half-manufactured goods. There was a decrease in the exports of manufactured products amounting to 80 million francs, which was largely due to the disturbances in Tonquin and Madagascar, causing importing merchants in England and other countries to withhold orders, in expectation of a decline of the market.

The question whether France has entered upon a period of commercial decline has recently been a subject of controversy among French economists. In the ten years from 1873 to 1882, the imports increased in total value from 3,554 to 4,972 million francs, while the exports decreased from 3,787 to 3,596 millions. The imports of corn and wine increased from 257 to 376 millions; manufactured products from 334 to 673 millions, or 75 per cent., the articles in which the increase was greatest being machines and boilers, tools, woolen and cotton fabrics, and glass. The export of French manufactures shows some increase since 1873, but is still 171 millions behind the amount in 1873. The decrease is mainly in turned goods, toys, brushes, and silk fabrics. In the first three, Germany and

Austria compete with the Parisian industry, which suffers an annual loss of 70 millions in the value of the exports. The value of silk-manufactures export was 176 millions less than in 1873. In woolens, on the other hand, there was an increase. Those who belong to the free-trade school take the more hopeful view of the situation, and believe that the removal of tariff restrictions would open foreign markets again to the products of French industry. The increase in imports they consider an evidence of accumulated wealth invested abroad, and compare France in this respect with Great Britain and Belgium.

The destruction of the vineyards by the phylloxera was undoubtedly a heavy blow to the prosperity of France. There are indications, however, that the worst period is past, and that this new enemy of the vine will be brought under control like the oidium, which was still more destructive than the phylloxera, reducing the vintage, when it first attacked the vines in 1853-'56, to 15,000,000 and even 10,000,000 hectolitres. French viticulture survived this severer stroke, and gradually recovered, until in 1875 the wine-harvest attained the unprecedented figure of 88,000,000 hectolitres.

The industrial expansion of Germany, Austria, Italy, the United States, and other countries, encouraged by protective tariffs, is the element with which the manufacturing industries of France have to reckon. The energetic band of free-trade advocates in France argue that the adoption of restrictive and retaliatory measures by their country has greatly contributed to the difficulties of French industry; that the effect of refusing to receive the products of other countries in payment for French exports is to close those markets against French products, and that a return to the principles of the Cobden treaty would be the best means to enable the highly finished and therefore profitable products of French skill to maintain their position in the world's market. The industrial development of Central Europe falls in a large measure within the most recent commercial period. The effect of this new competition is most keenly felt by French manufacturing interests. In the development of the factory system, and the organization of production on a great scale, Germany has made greater strides than France. As long as labor is cheaper in Central and Southern Europe it is only the qualities of taste, art, and finish which enable French manufactures to hold the foreign markets, qualities which are least in demand in times of agricultural disasters and industrial stagnation, like those through which Europe has recently passed. The effect of the industrial development in Germany is seen in the returns of French foreign commerce, according to which an excess of French exports to Germany of 42,000,000 in 1876 changed to an excess of nearly 75,000,000 on the other side in 1878; between which year and 1881 the French exports to Germany increased from 848,750,-

000 to 888,000,000 francs, and German imports into France at an equal pace from 418,838,000 to 454,875,000. The exports of silk manufactures and dress materials to Great Britain fell from 250,000,000 in 1865 to 114,000,000 in 1881; those to Germany from 23,000,000 to 21,000,000, while imports of German silks increased from 1,000,000 to 12,000,000. The exports of articles of dress and leather manufactures to the United States declined 80 per cent. in the same period.

The production of wine in France, which increased from 29,000,000 hectolitres in 1880 to 34,000,000 in 1881, fell off in 1882 to 30,886,352 hectolitres, 16,054,830 hectolitres below the average crop of the previous ten years. The vines suffered from the extension of the phylloxera and from the long prevalence of bad weather. The vineyards destroyed by the phylloxera have been to a considerable extent replanted with American vine-stocks, which are vigorous enough to resist the parasite.

The phylloxera appeared in 1882 for the first time in Seine-et-Marne, Cantal, Indre-et-Loire, Vendée, and Haute-Vienne, making altogether fifty departments visited by the plague. The area attacked comprised nearly half the vine-lands of these departments. The vine-growers at first opposed the official investigation and concealed the symptoms of the malady. Subsequently they adopted the plan of prevention invented by Pasteur, but no system of comprehensive treatment, either official or co-operative, could be agreed upon. Some twelve thousand wine-raisers formed combinations for common action.

Posts and Communications.—The number of post-offices in 1881 was 6,158, against 5,913 in 1880; number of letters carried in 1881, 569,910,358; postal-cards, 32,224,239; letters with declared valuable inclosures, 11,327,262; journals, 345,364,572; circulars, etc., 373,075,770; total deliveries, 1,386,902,201; receipts in 1880, 112,683,458 francs; in 1881, 123,472,000 francs; expenses in 1880, 79,431,712 francs; in 1881, 81,398,988 francs.

The state telegraph stations in 1881 numbered 5,481. The length of lines at the end of that year was 78,878 kilometres, comprising 69,688 kilometres of overhead lines with 216,878 kilometres of wire, 685 kilometres of subterranean lines with 12,521 kilometres of wire, 3,452 kilometres of submarine lines with 3,668 kilometres of wire, and 108 kilometres of pneumatic tubes; total length of wires, 233,057 kilometres. The number of internal telegrams in 1881 was 17,514,147; of international, 1,952,017; receipts in 1880, 25,612,399 francs; expenses, 81,141,178 francs; receipts in 1881, 29,095,048 francs; expenses, 32,222,642 francs.

There were in operation on Jan. 1, 1883, 26,387 kilometres of railroad lines of general interest, comprising 2,084 kilometres of state lines, 22,282 of lines of companies, and 1,921 of non-subsidized lines, besides 2,805 kilometres of lines of local interest, and 212

kilometres of industrial lines; total length of lines, 28,804 kilometres.

By the law of June 11, 1842, the work of building railroads was left to companies, superintended, and when necessary assisted, by the state. Two classes of lines were distinguished from each other—the one, called the old net-work, consisting of the principal avenues of traffic; and the other, the new net-work, of secondary routes of doubtful profitability, constructed for public utility. To the latter 4 per cent. interest and 0.65 per cent. for a sinking fund were guaranteed. The French railroads are almost entirely in the hands of six great companies—the Paris-Mediterranean, owning 4,488 kilometres of the old and 1,543 of the new net-work; the Paris-Orleans, owning 2,017 of the old and 2,842 of the new; the Northern, possessing 1,811 kilometres in the first system and 668 of guaranteed; the Western, with 900 and 2,216 kilometres respectively; the Southern, with 796 and 1,518; the Eastern, with 754 and 2,007. Of the 10,315 kilometres in the old net-work the remaining 54, and the remaining 3,245 out of the 13,539 kilometres which constitute the new net-work, belong to other companies.

Railroad Conventions.—The most important transaction of the session, which closed August 2d, was the conclusion of the long-deferred conventions with the railroad companies. The arrangements involve the virtual abandonment of the Freycinet project for nationalization of the whole system of French railroads and its completion by the state. The reasons given for departing from this cherished and already partly executed scheme were, that the state of the public finances in the present conditions of the money market would not permit of the necessary financial operations and the simultaneous conversion of the public debt on favorable terms. The transfer of the railroads to the Government would require no capital outlay; but the execution of the Freycinet scheme of connecting and strategic roads at the sole cost of the Government would necessitate the raising of new loans. The conventions require the six great companies to construct about 9,000 kilometres of new railroads within ten years, about 1,000,000,000 francs of the cost to be borne by the companies, and the remaining 750,000,000 or 800,000,000 francs by the Government. The French railroad companies are influential because their enormous capital is in few hands, in those of the magnates of finance, a circumstance which subjects them to jealous popular animosity, and any Government and Chamber which has dealings with them to suspicion. Notwithstanding the stringent control preserved by the Government, they have succeeded in exacting disproportionate rates for the poorest service in Europe. The conventions, while perpetuating the monopoly, secure an abatement of the grievances. The question of differential tariffs was much discussed, and the proposal of uniform rates finally

condemned. Reductions in freight-rates for the benefit of exporting manufacturers was secured, and also general reductions in freight and passenger tariffs, conditional on proportional remissions in the Government taxes on fast-traffic rates. The share of the Government in the profits was also considerably increased by altering the amount of the maximum dividend and the percentage beyond it which accrues to the state. The railroads are guaranteed against concessions for rival parallel lines; and on the other hand the right of the ultimate acquisition of the railroads was preserved for the state.

The Army.—The reorganization of the French army under the law of July 27, 1872, and the supplementary acts of July 24, 1873, March 13, 1875, and March, 1882, is nearly completed. Every Frenchman capable of bearing arms is required to train in the army, and may be called into service between the age of twenty and that of forty years. Exemption, according to the original intention of the law, was not to be allowed except for physical unfitness. Every Frenchman, on reaching the age of twenty, is enrolled in the active army, in which the period of service is five years, passing then for four years into the reserve of the active army. For the next five years he forms part of the territorial army, and for six years more is enrolled in the reserve of the territorial army. Besides those unfitted by physical infirmity, the eldest sons or grandsons of widows and aged fathers are exempt by law; pupils in the polytechnic and forestry schools, teachers in the public schools, professors in various institutions, artists who have gained prizes, and ecclesiastics, are exempt under certain conditions; and all who contribute to the support of families, or are engaged in studies, may be provisionally exempted by municipal councils. One-year volunteers are admitted upon passing an examination and paying 1,500 francs toward their clothing and maintenance. At the end of one year's service with the colors, all who have become proficient, and can read and write, may receive indefinite leave of absence. The active army and its reserve are drawn from and distributed over all parts of France, while the territorial army is divided into bodies corresponding to the localities from which its recruits are drawn, and the country is divided and subdivided into districts to which the greater and lesser bodies are attached.

The infantry are armed with the Gras rifle, an improvement on the Chassepot, with metal cartridges. The cavalry carry carbines. The field-artillery have breech-loading guns in cast-steel of eighty and ninety millimetres' caliber.

The organization at present permits of placing in the field 24 army corps in the first line and 8 in the second line.

The troops in active service numbered 503,786 men, with 124,977 horses, in 1883, divided as follows:

BRANCH OF SERVICE.	Men.
Infantry.....	383,563
Cavalry.....	63,723
Artillery.....	70,379
Engineers.....	11,007
Train.....	11,496
Six mixed companies in Tunis.....	2,384
Administrative corps.....	23,573
Gendarmerie.....	26,512
Total active army.....	502,758

There were organized 468 battalions of active infantry, 485 battalions of territorial infantry, and 368½ battalions of fortress infantry, depot troops, and other infantry bodies, altogether 1,266½ battalions, numbering 1,266,500 men; 392 active squadrons, including 77 at the depots, and 79 territorial squadrons of cavalry, together 471 squadrons, containing 70,650 men; and 312 field-batteries, including 8 of marine, 57 of horse-artillery, 76 depot batteries, 57 batteries of fortress artillery, and 38 territorial field-batteries, altogether 540 batteries, with 2,952 guns, numbering 180,000 men. Adding 45,000 engineers, 26,000 in the active and 19,000 in the territorial army, and 5,000 pontonniers, the total strength of the army on a war footing is 1,567,150, and, including the auxiliary services, 1,780,300 men, of which number 1,186,300 belong in the active and 594,000 in the territorial army.

The increase and enlargement of the fortresses, notably the innumerable blockade fortresses erected on the German frontier, necessitate an augmentation of the artillery. A law passed in the session of 1883 raises the peace footing of this arm 8,840 men, and provides for the increase of the batteries of stationary artillery ready for mobilization from 57 to 190. The complete separation of the field and fortress artillery, accomplished in the German army, is not carried out. The two branches of the arm are, however, divided into separate battalions. The cost of the augmentation was partly met by abolishing the active artillery train. The difference is scarcely felt in an army budget for 1883 of 584,000,000 francs, and supplementary estimates of 81,000,000 francs. The willingness of the French people to endure sacrifices for the re-establishment of their military power is shown by the calmly received statement of Minister Billot that the replacement of war material since the war had cost 2,289,000,000 francs, and would require 800,000,000 more.

The Navy.—The navy, at the beginning of 1882, had 57 iron-clad steamers, with 481 guns; 264 unarmored screw-steamers, with 1,547 guns; 62 side-wheel steamers, with 154 guns; and 113 sailing-vessels, with 672 guns; altogether 496 vessels, with 2,854 guns. The ironclads of the first class were 26 in number; of the second class, 18; coast-guards, 6; floating batteries, 7. The most powerful of the ironclads are the *Dévastation*, *Foudroyant*, and *Admiral Duperré*, all constructed on the same model, mainly of steel, 312 feet long, the first two with 14-inch armor, and carrying four 38-

ton and two 25-ton guns, the last armored with 12 inches of steel, and without the two smaller guns. Next to these come 6 battle-ships, differing only in size and strength, armed with two 38-ton guns, and two of them carrying four 24-ton guns. All have horizontal steel plates, bomb-proof decks, and their guns mounted *en barbette*. There were five more not much inferior, and differing in little except in having smaller guns and lighter armor. The rest of the ironclads were of antiquated designs. There were building in 1882 the *Kaiman*, the *Terrible*, and the *Requin*, on the model of the *Inflexible*, but smaller, with fixed turrets and guns mounted *en barbette*, plated with compound armor, 50 centimetres thick, each of 7,168 tons' displacement; also three ships of the *Audacious* class, with plates of 25 centimetres' thickness, and the *Formidable* and *Amiral Vaubin*, monster ironclads of 11,300 tons, with armor 45 to 55 centimetres thick.

Finance.—The accounts of 1870 and 1871 were balanced with a surplus of 113,730,053 francs. The accounts of 1872, 1873, and 1874 were closed with deficits amounting to the sum of 191,264,128 francs. The budget of 1875 shows 98,204,823 francs excess of receipts; that of 1876, 98,204,823 francs; that of 1877, 68,811,809 francs; that of 1878, 62,356,879 francs; that of 1879, 96,207,185 francs; that of 1880, 134,450,970 francs; that of 1881, 70,793,882 francs. The budget of 1882 presents a deficit of 47,397,195 francs. The estimates for 1883, after the presentation of an extraordinary budget of 800,000,000 francs, showed an excess of expenditures incurred by the Government over the credits voted, amounting to 100,000,000 francs. It was stated in the debates that the expenditures on war material and fortifications since the war had amounted to 2 milliards, and those on public works to 1½ milliards. The total expenditures, according to the closed accounts for 1869, amounted in that, the last normal year under the empire, to 1,740,000,000 francs. The greatly increased and still increasing expenditures under the republic, due mainly to the greatly augmented public debt, but to a considerable extent to increased expenditures on the army, and for various other objects, were partly covered by the increased yield of the direct taxes, yet chiefly by the imposition of new indirect taxes, such as sugar, wine, salt, and railroad imposts.

The practice of presenting nearly balanced budgets, and in the final accounts, published a number of years afterward, disclosing large deficits, did not originate with the ministers of the republic, but has been followed by all the governments of France since the Restoration. The public debt of France before the German War was largely the result of this process.

The state of the public finances has given rise to serious alarm for several years past. The prudent and economical financial management of M. Thiers and the other statesmen

who established the credit of France after the war, insured the acceptance of republican institutions. The prodigality of the Chamber since 1876, when the results of that conservative management were seen in five years of surplus revenue over the increasing expenditures, awakened the distrust in the workings of the present political system which has recently shown itself. In no other country except the United States is the expenditure of the public moneys so subject to political and electioneering influences, or less closely watched by the people. The Government plunged into every kind of ambitious project. At one and the same time it sought to rival Germany in its army and defenses, England in its navy and colonies, Switzerland in popular education, and America in railroads. The pension-list was largely augmented and new offices created to suit the exigencies of party politics. Instead of seeking new sources of revenue to meet the increased expenditures, there were certain reductions made in the taxes, which impaired the revenue without affording a proportionate relief to the tax-payers, as the Government was guided rather by political motives than by fiscal principles. The Treasury could have been relieved by the conversion of the debt at a lower interest, but for political reasons this was deferred for seven years, until under the pressure of deficits it became necessary. In 1875 the ordinary expenditures amounted to 2,626,000,000 francs, which was 1,005,000,000 more than the last budget of the empire, that of 1869. The service of the debt required something over 1,000,000,000 francs, leaving about 1,600,000,000 francs for the expenses of the Government, which was from 400 to 500 millions more than in the year before the war. From 1875 to 1880 the expenditures increased at the average rate of 40,000,000 francs per annum. Since 1881 the rate of increase has been two and a half times as great, and during the same period the expenditures have exceeded the revenues, and an annual deficit has been added to the public debt. From 1875 to 1880 there was an annual surplus. In 1881 a surplus revenue was reported, but the critics of the budget find that it was produced by counting the surplus of the preceding year among the ordinary receipts, and transferring certain permanent charges on the revenue to the account of extraordinary expenditures, so that there was an actual deficit of about 50 millions. The Government reports a deficit for 1882 of 47 millions, which by the stricter method of book-keeping would amount to 167 millions. The budget for 1888 was fixed at 3,044,000,000 francs. At the end of the first quarter supplementary credits had been added to the amount of 43 millions. These supplementary votes are an evidence of the lack of a rigid control over the public purse. In 1881 they amounted to 181,000,000 francs, in 1882 to 220,000,000 francs. The budget for 1884 is placed at 3,103,000,000 francs, nearly 200 mil-

ions more than the total ordinary revenue for 1882. The increase in the annual charge of the public debt was from 467½ million francs in 1869, to 1,130 millions in 1876, and 1,282½ millions in 1883; the expenditure on the army from 382½ to 812½ millions in 1876, and 667½ millions in 1883; that on the marine and the colonies, exclusive of Algeria, from 175 millions in 1869, to 250 millions in 1883. In addition to the heavy but more or less necessary increased expenditures on these heads the Chamber raised the budget of public works from 125 millions in 1869 to 575 millions in 1883, and that of public instruction from 25 to 112½ millions. Until the decrease in the yield of the taxes in 1882 and 1883 there was no reason to apprehend that the burdens would prove excessive for the tax-paying capacity of the French people. In the twelve years of the republic up to that time there was a surplus in eight years which exceeded the amount of the four deficits by 388 millions.

The budget for 1884 states the expenditures under the main heads as follow:

BRANCHES OF EXPENDITURE.	Francs.
Public debt.....	1,318,232,266
Dotations.....	30,692,116
Legislature.....	11,760,750
Justice.....	36,190,292
Worship.....	31,969,006
Interior Department.....	62,312,158
Algeria.....	9,406,430
Ministry of Finance.....	20,125,570
Ministry of Posts and Telegraphs.....	2,235,644
Ministry of War.....	695,907,000
Marine.....	204,570,877
Colonies.....	53,892,909
Public Instruction.....	124,883,161
Fine Arts.....	16,056,195
Ministry of Commerce.....	20,701,714
Ministry of Agriculture.....	25,760,640
Service of Public Works.....	96,183,200
Extraordinary public works.....	42,543,240
Régie and collection of taxes.....	333,602,107
Drawbacks and restitutions.....	20,454,600
Total ordinary expenditures.....	3,108,441,198

The budget for 1884 estimates the receipts from the various sources as follow:

SOURCES OF REVENUE.	Francs.
Direct taxes.....	886,105,100
Special imposts.....	25,804,960
Direct and special taxes in Algeria.....	9,171,336
Registration, stamps, and domains.....	761,508,492
Forests.....	35,433,814
Customs and salt-tax.....	407,713,600
Indirect internal taxes.....	1,118,738,806
Posts.....	187,450,000
Telegraphs.....	31,900,000
Tax (8 per cent.) on revenue from personal property.....	50,124,000
University.....	3,812,000
Penal fines.....	8,068,174
Service of civil pensions.....	21,544,000
Repayments of advances to railroads.....	24,900,000
Miscellaneous receipts.....	54,487,550
Appropriated from the surplus of 1881.....	16,698,000
Total ordinary revenue.....	3,103,700,948

The direct taxes consist of the land-tax (estimated yield, 176,320,000 francs), personal tax (85,408,000 francs), door and window tax (45,162,000 francs), and patent-fees (98,618,600 francs). The second item, special taxes analogous to direct taxes, includes various inspection-fees, taxes on carriages, clubs, billiards, a

tax on mortmain property, etc. The indirect internal taxes include excise duties on drink (425,753,000 francs), domestic salt (12,166,000 francs), and sugar (101,757,400 francs), matches (16,065,000 francs), paper (15,895,000 francs), etc., the produce of sales of tobacco (137,450,000 francs), and powder (14,914,000 francs), a tax of 20 per cent. on tickets for railroad express-trains, etc. The estimated amount of taxes collected in Algeria is 30,279,353 francs.

In 1793 all the debts, annuities, and other liabilities of the Government were funded in 5 per cent. perpetual rentes which required the annual payment of 174 million francs. The consolidated debt was reduced by repudiation and repayments out of the confiscated property of the church and nobility until at the beginning of the nineteenth century the annual charge was 40 millions. At the fall of the empire the interest charge was 68 millions. From the Restoration in 1814 to the Revolution of July in 1830, 165 million francs of new rente were added, representing the indemnity of 1,000 millions paid to the confiscated nobles, the war ransom of 700 millions, and the cost of the occupation, while reductions equal to the former annual interest were effected by amortization and conversion, leaving the rente charge 165 millions. During the same period the current accounts of the Government showed an average annual deficit of 1,268,000 francs; under Louis Philippe (1830-'48) the average deficit was 55,487,000 francs; under the second republic (1848-'51) it was 89,844,000 francs; under the third empire (1852-'69) it was 123,807,000 francs.

On the 1st of January, 1882, the amount of the public debt was 24,002,751,531 francs, and the rente charge 872,543,575 francs.

The state of the debt in 1883 was as follows:

DESCRIPTION OF RENTE.	Annual interest.	Nominal capital.
	Francia.	Francia.
Five per cent.	389,832,000	6,786,650,000
Four and one half per cent.	87,438,000	831,855,000
Four per cent.	446,000	11,153,000
Three per cent.	362,607,000	12,089,922,000
Last consolidated three per cent.	36,000,000	1,200,000,000
Total.	775,908,000	20,919,579,000

The charges on account of the public debt and other obligations of the Government are given in the budget for 1884 as follow:

PUBLIC DEBT EXPENDITURES.	Francia.	Francia.
Rentes at 5 per cent. and 4½ per cent.	876,766,501	
Rentes at 4 per cent. and 3 per cent.	868,143,781	
Total interest on consolidated debt.	739,901,282	
Payments of interest and principal from the budget of extraordinary resources.	940,000,000	
For the conversion of the Morgan loan.	17,899,000	
Interest on floating debt of the Treasury.	28,100,000	
Annuities to railroads.	43,781,501	
Repayments for war damages, contributions, etc., to communes, municipalities, etc.	23,188,500	
Other charges.	14,758,750	
Total payments on redeemable debts.	868,599,751	

PUBLIC DEBT EXPENDITURES.	Francia.	Francia.
Brought forward.	1,126,491,083	
Annuity rentes.	26,707,238	
Military pensions.	84,500,000	
Civil pensions.	56,800,000	
Various pension and other charges.	24,215,000	
Total transient liabilities.	191,732,238	
Total.	1,318,222,266	

French rentes were held in comparatively few hands until under the third empire they began to be distributed among the people. In 1870 the number of holders was 1,254,040, the annual rente amounting to 358 million francs. In 1881, when the interest was about 852 millions, the number of holders was 4,617,900.

The long-deferred conversion of the 5 per cent. rentes was finally resolved upon in 1883, in view of the emergency in which the Government found itself with increasing expenditures and a falling revenue. The French Government had postponed the operation, though it would save many millions annually, from a reluctance to curtail the income of the bondholders, who form so large a part of the population. The scheme of exchanging 8 per cent. bonds for the 5 per cents. at an equivalent capitalized value was proposed for the sake of permanence and uniformity, as part of a scheme to convert the whole debt into 3 per cent. rentes; but, as it would preclude all future reductions in the interest charge and increase the nominal amount of the debt two milliards, the Government naturally preferred to effect about the same annual saving of 35 millions, with the prospect of future reductions of over 100 millions per annum more, by exchanging 4½ per cent. stock at or near par for the 5 per cents., pledging itself against a further conversion within five years.

Paris and the other municipalities have debts which were greatly increased by the war. The budget of the city of Paris for 1880 estimates the revenue at 233,622,125 francs, derived principally from the octroi tolls, which were estimated at 128,718,600 francs. The largest item of expenditure is the interest and sinking fund of the municipal debt. The capital amount in 1880 was 2,295,000,000 francs.

Prince Bonaparte's Manifesto.—In Gambetta the republic lost perhaps the only man who possessed the political strength and prestige to lead it through a crisis. He himself, by the adventurous foreign policy and the idea of personal rule which he represented, had done not a little to unsettle the public mind, and to reawaken a desire for the strong governing hand to which France had formerly been accustomed. His programme, although it had cost him the premiership, had restored him to the position which he held after the national defense as the champion on whom the republic must rely in the hour of its need. He assumed this position more distinctly in his later appeals. The monarchical parties echoed the demand for a strong and stable government, and when Gambetta died they prepared to renew

their agitations. The various radical groups, of a more or less socialistic bent, had been visibly kept in restraint by Gambetta. There was a prospect that the center of gravity in the government would now shift farther to the left, and to the *régime* of the freethinkers would succeed one of socialistic experiments. With a make-shift ministry, a Chamber which served only as a forum for wordy contests with the foes of the existing order, and with the wide-spread mistrust which Gambetta had fomented, that the republic, constituted as it was, was incapable of maintaining the interests and dignity of France abroad or a stable order at home, the situation was favorable for a *coup de main* or revolution if any of the hostile parties were able or willing to profit by it.

A Legitimist agitation was set on foot in the Vendée and the south of France, at Montpellier, and the other strongholds of royalism. There was talk of reorganizing General Charette's royalist legion, which in 1870 was reputed to number 8,000. Rumor exaggerated the preparations into 1,500 Papal Zouave veterans in Paris, and 33 legions organized as hunting-clubs in the country, with a treasure of 15,000,000 francs in London. The Count de Chambord was expected to issue a manifesto. A sudden damper was thrown upon the movement by an unexpected act of Prince Napoleon, who, in order to forestall the Count de Chambord and claim the position which his party denied him, of head of the Bonapartes, placarded on the walls of Paris and published in the "Figaro," January 16th, a manifesto in the form of an arraignment of the republic and apology for his own position.

On the same day on which this manifesto was issued Prince Napoleon was arrested and confined in the prison of the Conciergerie on the charge of an "attempted act against the safety of the state, for the purpose of changing the existing form of government." The manifesto had no popular effect, but it rallied to the prince the Bonapartist politicians, who, on account of his republican principles and radical sympathies, had sought to thrust him aside in favor of his son, Prince Victor.

Pretender Question.—In the Chamber the manifesto was the signal for calling forth, not so much the fears, as the antipathies, of the Republicans against the Bourbon princes and the socially powerful though politically prostrate section of the community which clung to the principles of royalty and aristocracy. The Duc d'Aumale and his aspirations to the presidency of the republic were more dreaded than "the King" in Frohsdorf, or the discarded head of the Bonapartes. A bill was at once brought in by M. Floquet to banish from the soil of France and the colonies, and deprive of all political rights, the members of families which formerly reigned in France. Urgency was voted by a large majority. A government bill was presented by M. Fallières, Minister of the Interior, which would empower the Executive

to expel from French territory any prince whose presence might be considered dangerous to the state, and, if an officer of the army, to place him *en disponibilité*. The committee appointed by the bureaux to discuss the measure at first reported a bill as rigorous as the Floquet proposal, but finally agreed to a compromise, incapacitating the members of dynastic families for any electoral function or any civil or military employment. M. Duclerc, the Premier, and Gen. Billot, Minister of War, refused to accept the Fabre compromise, and the Cabinet, in consequence, resigned. Admiral Jauréguibery, Minister of Marine, had already tendered his resignation. President Grévy simply accepted the resignations of the three ministers who objected to a compromise, and, upon M. Jules Ferry's declining to form a Cabinet, intrusted M. Fallières with the premiership, January 29th. On February 1st the bill passed by a vote of 355 to 142, 53 Republicans voting with the minority, and 42 abstaining, mostly because the bill did not go far enough.*

Interim Ministry.—The Ministry of War was offered to Gen. Camponon, a Gambettist, who declined the office. It was accepted by Gen. Thibaudin, who, though absolved by a council of officers, was supposed by many to have broken his parole in escaping from imprisonment in Germany and joining the army of the national defense. At the time that the crisis culminated, M. Duclerc was seriously ill, and sent his resignation from a sick-bed. In the midst of his first speech as Prime Minister, M. Fallières was also taken ill, overcome by anxiety and loss of sleep. M. Fallières was about forty-four years of age. Like the other members of the Duclerc ministry, he was new to office, but passed for the ablest speaker among them. Before entering public life he was a lawyer in the small town of Nérac. The aged M. Duclerc was well known and respected in the Chamber, but had not the eminence and weight of character which could command the obedience of the majority. M. Déves, the Minister of Justice, was not an eminent lawyer, nor did M. Duvaux, Minister of Public Instruction, formerly professor in the Lycée at Nancy, add to the authority of the Cabinet, though all

* The princes of Orleans, who are retired from active service in the army, though not deprived of their military rank, by the pretenders' bill, were proscribed under the empire, but returned to France in virtue of an amnesty law, passed in 1871. Prince de Joinville and Duc de Chartres had served in the Second Army of the Loire under assumed names, with the knowledge of Gen. Chanzy, who sought in every way to advance their interests. The Prince de Joinville was discharged and sent out of the country by orders of Gambetta, but the Duc de Chartres concealed his identity and was decorated with the cross of the Legion of Honor. The Duc de Nemours and the Duc d'Aumale figure on the army lists as generals of division, having been advanced to that grade during the reign of their father, Louis Philippe. At the time of the passage of the act the Duc de Nemours was in the reserve, the Duc d'Aumale was *en disponibilité*, the Duc de Chartres was in command of a regiment at Rouen, the Duc d'Alençon commanded a battery of artillery, the Duc de Penthièvre had resigned, and his father, the Prince de Joinville, retained the rank which he had received by royal ordinance, of vice-admiral in the navy. Of the Bonapartes, Roland, the son of Pierre, held a captaincy in the line.

of them were respected as men of sense and ability. For these reasons the Duclerc ministry had several times to experience adverse votes which were not intended to express want of confidence, but simply signified absence of party discipline and lack of a vigorous leader. When Duclerc retired, the rump Cabinet was only retained as an *interim* ministry pending the settlement of the pretender question. With two portfolios vacant, and M. Fallières still too ill to attend to affairs, it could not even present the semblance of constituting a government. In the flux and disorganization of parties, the crisis was prolonged, and passed through various unexpected phases. When the bill came before the Senate the first feeling was in favor of its rejection pure and simple, in which sense the committee made its report. But the leaders of the Left Center, unwilling to block their path to future office, proposed a compromise which secured a majority. This, the Say-Waddington bill, made public acts or demonstrations of pretenders belonging to ex-regnant families tending to jeopardize the state, punishable by banishment. Another proposal, suggested by M. Barbey, was to give the Executive discretionary power to expel princes for acts and demonstrations as pretenders. At the beginning of the long debate in the Senate the circumstances were altered by the quashing of the complaint against Prince Napoleon. The thirteen judges of the *Chambre des Mises en Accusation* found that no indictment lay against the prince, since the publishing and placarding of his proclamation was admissible under the press law, and, in the absence of overt acts, did not constitute an attempt to overthrow the government. Prince Napoleon, released from his three weeks' confinement, betook himself to Belgium, where, having been acknowledged for the first time by the ex-Empress and a section of the party, he continued the *rôle* of representative of the imperial cause and "Napoleonic ideas"; but, later, the old differences with the Bonapartist politicians were renewed, and Prince Victor was induced to come out in opposition to his father. On the 13th of February, when the pretenders' bill was passed back to the popular assembly in the form of the Say-Waddington amendment, the headless and useless ministry formally resigned. At this stage the Paris merchants expressed their uneasiness in a petition to President Grévy. The working-men followed with a petition for the expulsion of the princes and a bolder foreign policy. The Chamber, on the return of the bill, refused to consider the Senate amendment, dallied with the Barbey compromise, and then finally sent up to the Senate the original Floquet bill. In the Senate, by the shrewd tactics of the leader of the Right, the Duc de Broglie, who had left the field free for the republican opponents of exceptional legislation, the bill was now rejected by a majority of five, after a month of impassioned discussion. The vote was taken February 17th.

Ferry Cabinet.—Jules Ferry, who had postponed taking office until the expulsion question was decided, upon the collapse of the bill undertook to compose a ministry and formulate a programme which would secure the support of enough of the 140 members of the Republican Union, Gambetta's Opportunist group, to make, with the 180 belonging to the Democratic Union and Center groups, a steady majority over the 90 members of the Right and the 90 of the Radical Left and Extreme Left, re-enforced by the remainder of the Gambettists. On the 21st the list was published, as given near the beginning of this article.

M. Ferry, after the death of Gambetta, was the most conspicuous figure in the Chamber, and was the only ex-Premier who had not been precipitated from office by an expression of want of confidence. His constructive work in the reform of education gave him a title to greatness which was no longer darkened by the stormy polemics which assailed him as the ministerial representative of the anti-Clerical policy and the author of "Article VII." The retention of Gen. Thibaudin and the appointment of M. Challemeil-Lacour, the most vigorous advocate of the ostracism of the princes, indicated the attitude of the new ministry on this question. The Foreign Minister was known as a *doctrinaire* Republican who commenced life as a teacher of philosophy in the Lycée at Pau, was imprisoned and banished after the *coup d'état*, translated works of German philosophy and officiated as Professor of French literature at Zurich, and after his return to France in 1856 became a journalist. He was Prefect of Lyons during the war, and had to contend with the communards under Arnaud. He was appointed by M. Waddington to the London embassy. Although he had repeatedly been spoken of for a portfolio, his friend and leader, Gambetta, did not include him in his Cabinet. M. Charles Brun, a naval engineer of high reputation, who had sat in the Chamber since 1871, but without taking an active part in the debates, was the first civilian who has filled the Ministry of the Marine. M. Mélines, the Minister of Agriculture, a lawyer by profession, had distinguished himself as an advocate of protection, and was reporter of the general tariff committee. MM. Tirard and Cochery had held the same positions in the preceding Cabinet, and M. Hérisson, the Minister of Commerce, was transferred from the Ministry of Public Works. M. Waldeck-Rousseau, one of the most prominent of the younger politicians, was Minister of the Interior under Gambetta. M. Raynal was Minister of Public Works, and M. Feuillée sub-Secretary of the Department of Justice in the same ministry. MM. Challemeil-Lacour and Charles Brun represented the Cabinet in the Senate.

In the declaration which Minister Ferry read in the Chamber, he announced that the princes in the army would be placed in non-activity, and the order was issued immediately. This

was done by straining an old army law of 1834.

Revision Question.—The question of the revision of the Constitution was the first one pressed upon the new ministry. Dr. Clemenceau, at the head of the Radicals, made a vehement appeal to have the question with which Gambetta had temporized finally decided, and sentence pronounced upon the Senate after the collision with the Chamber on the pretender question. M. Ferry took a firm stand, refusing to subject the country to the agitation of a dissolution of the National Assembly and a conflict with the foes of the republic over this delicate question. The Chamber, by a majority of 150 votes, approved the decision to postpone revision until after the general election of 1885.

Socialist Agitations.—While Prince Bonaparte was undergoing internment, and the Floquet proposal for the ostracism of the French princes was before the Chamber, the trial of the Lyons Anarchists came to an end. Prince Krapotkine and the other accused, 52 in number, were brought to trial under an act directed against the International Society. They were arrested after the labor riot at Montceau-les-Mines in 1882, and a disorderly demonstration in Lyons occurring at that time, consisting of the explosion of a dynamite cartridge in a coffee-house. They acknowledged and defended their anarchist and socialistic doctrines, but denied belonging to the International Association, which had gone out of existence. Prince Krapotkine recounted the story of his life, saying that witnessing as the son of a Russian serf-proprietor cruelties which matched the tales of "Uncle Tom's Cabin," his sympathies were drawn to the oppressed, while the vices and corruption which he saw in the Russian military service gave him a contempt for his own class. While Professor of Mathematics in St. Petersburg he was arrested as a Nihilist, and witnessed in prison horrors which drove nine fellow-prisoners to madness and eleven to suicide. The accused Anarchists were convicted of belonging to an international organization and were condemned, Prince Krapotkine with three others to five years' imprisonment, ten years of police surveillance, and five years' deprivation of civil rights, and the rest to lesser punishments.

Scarcely had fears from the Legitimists been allayed by the adoption of the pretenders' bill, and the assumption of the government by firmer hands, when the opposite party of disruption, the heirs of the Commune, began to lift their heads. An open-air meeting of Parisian artisans out of work was convened for March 9th by placards issued by the Carpenters' Union, announcing as the order of the day "To call upon the Government to take immediate measures to provide bread for those who have none." The distress among the working-people, owing to commercial stagnation and a severe winter, was greater than it had been for many years. "If our rich republic," the address declared, "has no longer work to give

us, it ought at least to feed the creator of its wealth and its firmest bulwark—the artisan." The task of providing work for the unemployed was tacitly assumed by the republic from the beginning, though not freely acknowledged by responsible statesmen. It was the principal cause of the expenditures on public works which created financial embarrassments for the Government. The mechanics of Paris, Lyons, and the few other large cities where revolutions are enacted, stood as arbiters over the republic; but, as they became more imbued with socialistic theories, they became estranged from the Government, and torn by internal dissensions which prevented them from making a direct impress on legislation; their latent power, however, increased, and after the amnesty of the communards the labor question bore the character of an issue to be dealt with in the near future. Clemenceau and the Radicals adopted the less advanced propositions of the Socialists, such as the revision of contracts which have alienated public property, mines, railroads, canals, etc., and the progressive income-tax, as the platform by which they hoped to succeed to power.

French socialists are divided into three principal schools—Blanquists, Collectivists, and Anarchists. The disciples of Blanqui, the most conspicuous of whom is Eudes, general under the Commune, is not a numerous group, but a compact one, formed of bold and energetic men. They are averse to the discussion of social theories. All that is clear in their programme is the political method whereby they would accomplish sweeping, but undefined, changes in the constitution of society, which is by concentrating the power of the revolution in few hands, and granting their leaders dictatorial authority. They are therefore pure revolutionists, descendants of the Jacobins of 1792. The Collectivists base their demands on the familiar historical and economical arguments of socialists, and hold in the main the doctrines of the teachers of German democratic socialism. Their aim is to make machinery, raw materials, and all the apparatus and means of production the collective property of society, and would accomplish this by a revolutionary overthrow. To a small group, which has its headquarters in Belgium, the appeal to physical force is repugnant. These, known as Collinsians, expect to effect the transfer gradually by means of a tax of 25 per cent. on succession, and the reversion of property to the state where there are no direct heirs. The revolutionary Collectivists are split, through personal rivalries, into two warring factions, the larger of which is called the Union Fédérative, and the other the Fédération du Centre. The Anarchists, represented by the imprisoned Prince Krapotkine and the geographer Elisée Reclus, like the Collectivists, desire to make capital and the means of production social property, and are opposed to all centralization of authority or fixed political organization.

They think that when society is organized on a proper basis, the functions of government and the principle of authority will become obsolete, that practical tasks will be delegated voluntarily, as outside of the sphere of government they are in a great measure, to persons who show the requisite knowledge and skill, and that, when it is necessary to take counsel, informal bodies—local, industrial, or more general—untrammelled by a rigid legal constitution, will establish themselves spontaneously. The Socialists of the old schools—Phalansterians, Proudhonians, Positivists—have ceased agitation. Those now in the field, as they became more disappointed and out of harmony with the republic, grew violent and revolutionary in their attitude. The more politic and ambitious, who thrive by agitation—such as Louise Michel, Lissagaray, Rochefort, Félix Pyat, Émile Digeon, and other editors and orators—did not compromise themselves by adopting any system of socialistic doctrine, but followed the popular revolutionary drift, and grew more inflammatory in their language.

The meeting of the unemployed working-men was held on the Esplanade des Invalides. It was arranged by one of the numerous groups of agitators, and was consequently discouraged by the rival agitators. About 4,000 people assembled, a considerable proportion of whom were actually distressed mechanics in the building-trade and Paris industries. The police kept the crowd moving, and when Louise Michel, the orator of the day, appeared, she was interrupted in the beginning of her address. Suddenly, at a signal-cry, the crowd started for the presidency, but were driven back by the police. The whole programme of the demonstration was prearranged, and the spectators far outnumbered the participants, many of them reactionaries, wishing and expecting a serious collision with the police. When the passage of the Bridge de la Concorde was opposed by the police, the mob made a show of resistance, and a brief struggle took place before they retired. A band of those who did not join the demonstration on the Elysée followed Louise Michel up the Boulevard. Some of them entered the bakers' shops demanding bread. If the shopkeepers refused to give them loaves, they broke the windows and helped themselves. This episode formed no part of the original programme, in which the assembly and the police acted their parts with formal regularity. Louise Michel did not suggest the proceedings, but, when she saw them, laughed at the ingenious idea.

The carpenters' demonstration and march on the residence of President Grévy was only one of many signs that the French working-man, now pinched by hard times, was determined to call the republic to account for neglecting social legislation. The excitement was intense among all classes. The political parties all endeavored to make capital out of the situation. The Bonapartists and Legitimists accused the

Republicans of having brought the distress upon the working-class, and were themselves accused of having instigated the riot of March 9th, and of being in league with Anarchists. The crisis in the building trade was ascribed in part to the pampering of the working-class by the municipality of Paris, which paid high wages to carpenters, and forced up the scale until work could be done in the provinces 15 to 20 per cent. cheaper. Wages were said to have risen 60 per cent. in the building trades since 1875.

A second demonstration was attempted on Sunday, March 11th, but the Government adopted vigorous measures for the repression of revolutionary agitation. A great number who took part in the demonstrations of the 9th were arrested and sentenced to short terms of imprisonment. Louise Michel gave herself up, after evading the police for a week or two. On June 21st Louise Michel, with eight other persons, were put on trial on the charge of inciting to pillage. This orator and poet of the social revolution was forty-six years old. Before she entered upon the career of a communistic agitator she was a school-teacher. She had endured the horrors of exile in New Caledonia, and returned with the last of the amnestied communards. On one of her companions was found a revolver, and in his lodgings explosives and many copies of a pamphlet such as had been recently distributed among the soldiers, inciting them to burn their barracks. He was a book-agent, named Pouget, twenty-three years old. The two prisoners conducted their own defense, injecting political sarcasms and denunciations into their pleas. They were pronounced guilty, and sentenced—Louise Michel to six and Pouget to eight years' imprisonment, with ten of police supervision for both.

Labor Legislation.—The problem of artisans' dwellings was a branch of the labor question which the Premier took up with sympathy and zeal, as the solution would remove a growing evil and at the same time provide work for the clamorous carpenters and masons of Paris. He entered into arrangements with the Land Bank, by which advances would be made to contractors to put up cottages, constructed on the best models for comfort and sanitation, in the environs of Paris. These dwellings, 18,000 in number, built at a total cost of 20,000,000 francs, were to be sold to working-men, and paid for in annual payments, which are somewhat less than the ordinary rent of apartments in the slums of Paris, but which will pay 5 per cent. interest and extinguish the principal in twenty years. These payments are guaranteed by the Government. At the same time, the municipality of Paris guaranteed loans amounting to 50 millions, at the same rate of interest and conditions of amortization, for the construction of model tenement-houses containing 26,000 dwellings. The rents range from 150 to 300 francs per annum. The tenants are partly relieved from taxes. The same system is

to be extended to the provinces, where greatly increased rents and industrial depression have created the same house-famine.

The cost of living among French working-people was computed from inquiries at Mulhouse by M. Armangaud, a statistician, to range from 1,100 to 8,000 francs per annum. Of the total, rent consumes 15 per cent., clothing 16 per cent., food 61 per cent., and miscellaneous expenses 8 per cent. Of the expenditure for food, 83 per cent. is for bread, 14 per cent. for meat, 18 per cent. for milk, 24 per cent. for groceries, and 16 per cent. for other aliments.

Judicature Bill.—A bill passed the National Assembly, without encountering the expected difficulty in the Senate, which forms part of a general scheme for the reform of the judicature elaborated by Gambetta and Cazot, President of the Court of Cassation. The French judiciary still consisted under the republic in great part of members of the hereditary caste who under the ancient *régime* transmitted the ermine from father to son. The smallness of the stipends precluded lawyers from accepting judicial positions, and the exclusive circle of the descendants of the old *noblesse de robe* made it unpleasant for any one not of their own class to enter the magistracy, though he had a private fortune sufficient to sustain its expensive state. The judgments rendered by this provincial aristocracy in political cases have been a scandal. They have refused to give effect to laws directed against monarchical and clerical intrigue, and have persisted in treating republicans as though they were the enemies of the established order. Gambetta was, for instance, condemned to four months' imprisonment for declaring that Marshal MacMahon must yield to the will of the nation or resign, and 2,700 sentences were recorded against republicans for resisting by legal methods the revolutionary plot of the monarchists to overturn the republic. Gambetta's project of reform was to reduce the excessive number of judges, increase the salaries, and recruit the bench entirely from the legal profession. The judicature act suspended the irremovability of judges for three months in order to enable Minister Feuillee to reduce their number by selecting and retiring 600 of them on pensions.

Anti-Clerical Legislation.—M. Grévy, at the reception of the new Papal nuncio, Mgr. Camille de Rende, assured him that "the protection due to religion, and the strengthening of the bonds of friendship existing between France and the Holy See, will be the object of our constant solicitude." The deputies, however, evinced by a number of enactments their hostility to the Church. The Chamber abolished the state subsidies to hospital chaplains, and decided that there should be no division between the Christian and Israelite portions of a cemetery, from which even the cross at the entrance was to be removed. Recognizing M. Grévy's disposition for conciliation, the Pope, in June, sent him a private letter complaining

of the hardships which the French clergy had to suffer under the republic, and asking his influence to procure an amelioration of their condition, and to prevent a rupture between the republic and the Vatican. M. Grévy replied in a conciliatory manner. This reply was followed by a dispatch from M. Jules Ferry, pointing out that it was difficult for a government to check a movement against the clericals while the latter remained so essentially hostile.

Wars in Tonquin and Madagascar.—The colonial policy which was adopted as more profitable than a European foreign policy—that is, as a renunciation, as far as the republic is concerned, of the revenge idea, and an escape from the risks and disquiet of the situation created by Gambetta—gave the Government and the public much to occupy themselves with in 1883 (see articles on TONQUIN and MADAGASCAR). The intention to establish a protectorate in Tonquin was announced in the beginning of May, and the first vote of credit sanctioning the scheme obtained. That same month came tidings of the defeat and death of Rivière. Thenceforth the credits were granted with practical unanimity, and the Government was supported in the prosecution of the enterprise and the diplomatic conflict with China.

The difficulties with the Hova government in Madagascar were a heritage from the Ducloer ministry. At about the time of Rivière's defeat the French men-of-war bombarded the Malagasy ports. The operations, and the Shaw affair, which was settled by paying the aggrieved missionary, are elsewhere described.

Insult to the King of Spain.—In August an article denouncing the French as disturbers of the peace of Europe appeared in the "North German Gazette." As soon as the annoyance caused by this had subsided in France, the German Emperor appointed the King of Spain, on his visit to Berlin, colonel of a regiment stationed at Strasburg, which appointment was deemed by the French a deliberate insult. Preparations had been made to give the King, on his return from the autumn manoeuvres at Hamburg, a warm welcome to Paris. The Radicals now raised an outcry, and it was feared that some disturbance might take place. On September 29th, on arriving at the station, the King was formally greeted by M. Grévy and M. Jules Ferry, but, outside the station, and throughout the whole of the King's drive to the embassy, a mob assailed him with groans, and cries of "Down with the Uhlan!" On subsequently paying an official visit to M. Grévy at the Elysée, a crowd made a rush at the carriage, and the King was again mobbed and insulted. Next day President Grévy paid a visit to the King, and, in the name of France, begged that he would not identify her with the "wretches" who had compromised her renown by demonstrations which he repudiated; he also prayed the King to attend the state banquet which was to be held in his Majesty's honor at the Elysée that

evening. The King consented, on condition that the apology tendered by President Grévy should be made public. President Grévy agreed to this, and the King attended the banquet, leaving the next morning for Madrid. The mere publication of the explanations in the official gazette was not objected to, but the demand for a diplomatic document was not acceded to.

Cabinet Questions.—The Minister of War, Gen. Thibaudin, was a disturbing element in the Cabinet from the beginning. He sought his support from the Radical factions, and became gradually estranged from his colleagues. Though he displayed ability and energy, and elaborated important improvements in the service, he imported into the army more of the political element which continually weakens its efficiency by destroying the *esprit du corps* that formerly existed. By refusing to allow Gen. Gallifet to conduct the cavalry manoeuvres, he came into conflict with his colleagues, but was compelled to yield. After the insult to King Alfonso, Gen. Thibaudin, who was blamed for not taking precautions, and who had refused to take part in the reception, resigned his office.

The Budget.—The finance committee of the Chamber insisted on a balanced budget, and little progress was made until the autumn session, which was devoted to this subject. M. Tirard's rectified estimates still showed a deficit of 65 millions. He was compelled to submit, in order to obtain an approximate balance, to a reduction in the sinking-fund appropriation, although he had declared on taking office that the amortization should on no account be intermitted.

FRIENDS. The Orthodox branch of the Society of Friends includes the London and Dublin Yearly Meetings; eleven Yearly Meetings in America, viz., those of Canada, New England, New York, Philadelphia, Baltimore, North Carolina, Ohio, Indiana, Iowa, Kansas, and the Western Yearly Meeting, and small bodies in Norway and Australia. These meetings assist in the maintenance of missions in India, Madagascar (where the Friends co-operate with the London Missionary Society), Mount Lebanon in Syria, in Mexico, among the North American Indians, and in the home countries of the several bodies. The reports made to the meetings and the statistical returns show that the decline in numbers of the society, which was remarked several years ago, has been arrested, and that, except in some of the Eastern meetings in the United States, the masses of the members are young.

The statistical reports for 1882 show the number of members of the Society of Friends in Great Britain and Ireland to be 18,000, besides some 5,790 persons who were not members, but who usually attended Friends' meetings. About 85,000 persons, only 8,000 of whom regularly attended Friends' meetings, were receiving instruction in First-day schools.

The London Friends' Tract Association had issued during the year 181,828 tracts, including editions in French, German, and Welsh.

Reports were made at the Indiana Yearly Meeting, in September, concerning home-mission meetings, prison meetings, and temperance union meetings that had been held during the year. Efforts in behalf of temperance had received especial attention, and had made great progress. The New York Yearly Meeting has the distribution of two funds—the Lindley Murray Fund, of \$50,000, the interest of which is distributed among charities; and the Moscher Fund, of \$18,000, which is devoted to the distribution of books relating to the interests of the Friends.

The Associated Committee of Friends on Indian Affairs received during the year ending in June, 1883, \$4,183, and expended \$3,171. Seven boarding-schools and ten day-schools were sustained, and three schools among the Shawnees in the Cherokee country were assisted by the committee; and the schools in the Sac and Fox, Osage, and Cheyenne and Arapahoe agencies returned an enrollment of 602 pupils. Arrangements had been made under the direction of the Indiana Yearly Meeting for the reception and education of Indian children at White's Manual Labor Institute, near Wabash, Ind., in behalf of which \$3,204 had been raised for the provision of buildings, and where fourteen boys and thirteen girls had been received. Indian girls who were taken to Trinity College, N. C., were found to be detrimental to the school.

The progress which has been made within the Society of Friends in adaptation to the changed conditions of modern life and thought is practically exemplified in the revised version of the "Book of Christian Discipline" which was issued, under the auspices of the London Yearly Meeting, to the members of the society in November. The present edition is the fourth that has been made since the book was first published, in the latter part of the last century. The volume is divided into three parts: The first part, relating to "Christian Doctrine," consists chiefly of extracts from the journal of George Fox, and from the minutes of the yearly meetings; the second part treats of "Church Practice"; and the third part, on "Church Government," relates to the order of meetings, the functions of officers, the mode of transferring members, and other internal regulations. The changes made in revision, which are considerable in number, are chiefly in the second and third parts. Some of them have been rendered proper by changes made in the civil laws since the last edition of the book was issued, as in the case of the repeal of compulsory church-rates; some by changes of opinion within the society; and some by the desire of the body to include later advices than those that had previously appeared. While the rules against "foolish and wicked pastimes," denouncing as such

"balls, gaming-places, horse-races, and play-houses," still stand, advice is now added enforcing the "duty of taking needful recreation," without which, it is observed, neither physical nor mental faculties can be preserved in a healthy condition. The counsel against the use of music is removed, while the caution against musical entertainments, especially against those "musical exhibitions in which an attempt is made to combine religion with a certain amount of amusement," is retained. The testimony against "ecclesiastical demands" is modified, but a minute is retained expressing continued belief that the "union of the Church with the state derives no support from the New Testament." To the pro-

longed testimony against war is added an extract from a former expression of the society against "military centers." The "Queries," or questions to be answered by meetings to their superior meetings, are simplified and so modified as to bring them into closer accord with the circumstances of modern life; a summary is given of a simplified form of marriage regulations, and considerable space is occupied with the statement of the rules in regard to removals, appeals, arbitration, and other internal arrangements of the society. The changes that are recorded are chiefly those that have taken place within the last twenty years, but are now, for the first time, placed in the official code or law of the denomination.

G

GAS. For many years gas-manufacture has been one of the most conservative of the industries, but the past ten years have seen a great advance in coal-gas processes, and the successful development of the manufacture of water-gas.

The great improvements introduced into the coal-gas manufacture may be referred to the furnace, retort-charging, and scrubbing. The general process is simple, and does not admit of much further development.

Furnaces.—About ten years ago one of the prevailing ideas of gas-engineers was, that a yield of 9,500 cubic feet per ton of coal, and of 6,000 cubic feet per retort daily, was good practice. The belief prevailed that a higher heat, productive of higher yields, would injure the quality of the gas. Later experience has controverted this idea. The tendency toward higher heats has grown, and the size of retorts has increased, until yields of 11,420 cubic feet per ton and 9,000 cubic feet or more per retort are frequently reached. It is especially in New England that these results are attained. The revolution in metallurgy and glass-making, due to the invention of the Siemens regenerative furnace, is known to all scientific readers. It was not till several years after its invention that gas-engineers adopted it. It was found to answer all expectations, but presented some objectionable features. To contain the regenerative chambers of the furnaces, a large excavation was necessary, involving considerable additional expense in building the furnaces. The gas-generator was an extra and costly piece of apparatus. Serious changes were necessary wherever the new furnaces were introduced into old retort-houses. Several modified furnaces were invented, combining some of the characteristics of Siemens's furnace with those of the old retort-bench. The new furnaces are all constructed on the same general principles. The fireplace is deep, with a grate of very small area. A limited supply of air, sometimes with the addition of a little steam, is admitted below, and passes through the thick bed of in-

candescent coke, thus producing carbonic-oxide gas and hydrogen. The gas rises into the oven containing the retorts, where it meets a new supply of heated air. A vivid, intensely hot combustion takes place, heating the retorts containing the coal. The hot gases from the combustion pass off through flues, parallel with other flues, through which the second air-supply enters. This heats the air before the final combustion, and in this heating of the air is seen to some extent the regenerative element of the Siemens furnace. The modifications just described amount to a more compact and cheaper construction of the same device. The results achieved by them affect economy of labor, economy of fuel, and higher heats, with consequent higher yields. The improved furnaces are so disposed that less labor is required in working them. The heat developed in the fireplace is comparatively low, so that less deterioration of the furnace takes place and less labor is required in removing the slag. The saving in fuel amounts to 80 per cent.

At first sight it would appear that the heat developed in the furnace in the carbonic-oxide combustion is lost, as it is not applied directly to heating the retorts. But this is not the case, as the carbonic-oxide gas is generated at a high temperature, enters the oven when very hot, and so transmits the heat of the furnace to the retorts. As in the original Siemens furnace, both elements, gas and air, are hot. The increase in the temperature of the retorts is very remarkable; comparatively small retorts carbonize large amounts of coal. The increased expense of the improved furnaces can be recouped to a certain extent by the fewer or smaller retorts necessary.

Hot-Coke Firing.—Any one who is familiar with the old gas processes must have been impressed with the inconsistency in the treatment of coke. It is drawn red-hot from the retorts, cooled off by dashing water upon it, and when perfectly cold a portion of it is used for the fires. Some of the furnaces just described use the hot coke as it comes from the retorts. It

is charged directly into them, thus not only saving that amount of heat, which is less than might be imagined, but also saving the labor of again handling the coke. In one of the large works of this city, where it has not yet been deemed advisable to introduce the new furnaces, an economy of labor and fuel is secured by charging the old style of furnaces with hot coke as it comes from the retort. It is drawn into a peculiarly shaped iron barrow, which is then wheeled in front of the furnace-door, and the coke is pushed in.

Retort-Charging.—Many efforts have been made here and abroad to do away with the laborious hand-charging. Apparatus has been tried by which a scoop of the length of a retort was introduced by machinery into the retort, and was then inverted, opened, or had its bottom withdrawn, dropping the charge of coal upon the bottom of the retort. These machines are preceded by another one which draws the coke from the retort. In all cases they work on the principle of the old-fashioned "drawing-rake." The coke is raked or hoed out of the retort, exactly as in the old hand-process. A very ingenious machine has recently been introduced for charging retorts, in which a jet of steam is made to drive the coal before it into the retort. As may be surmised, this is of extremely simple construction. A steam nozzle is arranged with a quick-opening valve so that a sudden puff of steam can be discharged. A scoop or pipe leads the coal down in front of the nozzle, and, by a succession of openings of the valve, the coal is driven in two or three installments into the retort. By graduating the force of the jets of steam, the coal can be deposited with great regularity along the entire length of the retort. An unsuccessful attempt has been made to use the same principle in discharging retorts.

The great objection to the mechanical stokers was their size, complexity, and consequent expense. By the use of the steam-jet these objectionable features, at least, were to a great extent obviated.

Scrubbers.—It is surprising how long it took gas-engineers to learn to wash the ammonia out of gas. For years, hardly an attempt was made to remove the ammonia economically and thoroughly. William Mann, of England, was one of the earliest to enter the field. He introduced his coke-scrubbers at many English works, where they met with complete success. Their construction is very simple, their efficiency being due to their size. They are iron towers, sometimes sixty or seventy feet high, which are filled with coke, and supplied with water at the top; this, trickling down through the coke, effectually absorbs the ammonia from the gas, which is driven up through the mass. Less than a gallon of water suffices for each thousand cubic feet of gas. Ammoniacal liquor of improved quality and high commercial value is also thus obtained. Another form of scrubber contains a series of vertical re-

volving disks, perforated with many holes, whose lower areas dip into water. The gas passes through these disks and is thereby very efficiently washed. The water is so distributed that the first disk is moistened with clean water, the next with the weakest ammoniacal liquor, and so on, the water regularly passing from end to end of the scrubber, against the current of the gas.

Other Improvements.—In the purification of gas the general practice has adhered to lime. Some very remarkable results have been achieved with bone-black, but they have led to no extensive practical use. Heating the gas with a small percentage of air before purification has also been tried, but with only experimental results. A new method of working purifiers has been introduced. Purifiers are arranged universally in sets of four, with center seal arranged to keep three of them continuously working, and one of the set always off for cleaning and refilling. By the new system either three or four purifiers can be kept in operation. Three are used while the fourth is being replenished, after which four are put to work, and kept so until the third purifier stains lead-paper, then the center seal is turned so as to reduce the working number to three, while the other one is cleaned out and refilled. A double center seal of peculiar construction is required for this process. The general idea is to keep four purifiers at work whenever possible, only reducing to three when one is to be cleaned out.

Water-Gas.—In this subject we meet with a genuine revolution. For many years it was the dream of engineers to obtain its hydrogen from water and utilize it for gas. Patent after patent has been taken out for hydrogen processes, which generally were based on two principles—reduction of steam by heated carbon, or by heated iron. In the first process, a mixture of carbonic oxide and hydrogen, theoretically in equal volumes, is produced. In the second process hydrogen only is generated, in volume three fourths that of the carbon gases. As carbon, molecule for molecule, is far cheaper than iron, and as it produces a greater volume of gas per molecule, it is universally used for the production of the hydrogen. The only departure from this rule is where a balloon is to be inflated; then iron may be used to decompose the steam, as it gives a far lighter gas. Thus the hydrogen-gas, so often named by the water-gas engineer, is really a mixture, containing only 50 per cent. of its name-giving element.

The flame of this "hydrogen," as we shall call it, is blue, and practically non-luminous. It resembles the lambent flame seen on the upper surface of a hard-coal fire, its blue color being due to the carbonic oxide it contains. To be of use in gas-lighting, it must be made luminous. It is not easy to say what is in the future, but to-day, whether it be electric light or gaslight, candles or oil, the source of all

artificial illumination is incandescent carbon. To render non-luminous hydrogen luminous, carbon has to be added to it. Imitating the constitution of coal-gas as nearly as possible, gaseous hydrocarbons of the paraffin, olefine, and aromatic series are introduced by the manufacturer. Owing to the enormous development of the petroleum industry, large amounts of petroleum and naphtha have been placed at the disposal of the gas-manufacturer at a low price, and these form very advantageous sources for the production of the hydrocarbons. Without them or some equivalent, water-gas could not be made in competition with coal-gas. To-day naphtha ranges in price from two to five cents a gallon. To carburet 1,000 feet of water-gas, five gallons of naphtha are required. When it is remembered that the total cost of the material from which 1,000 feet of gas is made is less than fifty cents, the importance of cheap naphtha will be evident.

Water-gas processes can be arranged under two heads—regenerative and non-regenerative. Two of the first-named processes may be described, and one of the latter.

The Lowe Process.—All the water-gas processes are the growth of engineering experience, even if, in their original conception, they represent inventions. They are protected by nu-

merous patents. In the Lowe process the coal, usually anthracite, is contained in a cupola or blast-furnace. By blowing air through it, after ignition, for from fifteen to forty-five minutes, it is brought to an intense heat. By the side of this cupola, or gasogen, are one or more cupolas, filled with fire-brick, stacked loosely, like those in a Siemens regenerator. The products of combustion from the gasogen pass through a pipe into the regenerative cupola and heat the contents to a white heat. The next step in the process is to turn off the air and admit steam at the bottom of the coal in the first cupola, or gasogen. At the same time a small stream of naphtha, or crude petroleum, is admitted to the gasogen at its top. The steam rises through the hot coal and is decomposed thereby, forming carbonic oxide and hydrogen. As the gas thus formed in enormous volumes passes upward and out of the gasogen it meets with the inflowing petroleum or naphtha, and the vapors produced therefrom, and carries the rich vapors on into the regenerator. The mixed gas and vapors pass through the hot bricks and acquire a high temperature. The vapor of naphtha is decomposed and converted into olefiant and other light-giving gases. In the language of the gas-engineer, the gas is "fixed." From the regenerating cupola it is conducted through ordinary purifying and scrubbing apparatus to the gas-holders. The gas-making period lasts as long as the heating period. Twice or oftener in the hour the valves are changed, and the steam and naphtha are shut off and air is blown in,

FIG. 1.—LOWE PROCESS.

merous patents. In the Lowe process the coal, usually anthracite, is contained in a cupola or blast-furnace. By blowing air through it, after ignition, for from fifteen to forty-five minutes, it is brought to an intense heat. By the side

and the reverse. Thus the operation is intermittent, gas-making occupying only half of the time. To make the process continuous two sets of apparatus must be used. The operation of coal-gas making is also intermittent, but to

a less extent. The coal in the gasogen is renewed from time to time, and the interior is cleaned out at longer intervals, but the heat is kept up for long periods.

The distinctive difference between the mode of applying the heat in this and in the ordinary coal-gas process will be noticed. In making gas from bituminous coal the material is heated in close retorts set in a furnace. The heat is applied to their exteriors. Fire-clay is not a good conductor of heat, but the heat of the furnace is pushed until the retort is heated through. All the heat the coal gets comes through three inches of fire-clay. This is an extremely wasteful way of applying heat. In the Lowe process the heat is applied directly, the same surface of the fire-brick being alternately heated by the products of combustion, and cooled by imparting its heat to the gases passing over it. The candle-power of the gas is under good control, being regulated by the admission of naphtha or petroleum.

The Strong Process.—This is applied to the production of hydrogen only. As in the former method, at least two cupolas are essential, one containing coal, the other fire-bricks. Assum-

before it reaches the gasogen. Then, very highly superheated, it passes downward through the hot coal and out of the bottom of the cupola, and is decomposed into water-gas. At the top of the gasogen there is an aperture, through which a quantity of coal-dust is admitted during the gas-making period. Remarkable as it seems, the steam is so highly superheated that its own heat is enough to cause it to be decomposed by the coal-dust. This is so true, that in the original process the current was not drawn through the coal-cupola at all. The gas was drawn off as soon as the contact between the dust and steam had been effected. But it was found that, though the steam was well decomposed, the gas contained a great deal of carbonic-acid gas. To remedy this trouble, the gas was passed downward through the hot coal. Thus in the Strong process the air and steam go in exactly opposite directions; in the Lowe process they follow the same course. The alternate periods of heating and gas-making are sometimes very short; they have been reduced to five minutes each. In this process the same system of direct heating is employed, but no naphtha is used, and a non-luminous heating gas is produced. The use of coal-dust is a noticeable feature in the Strong process. Sometimes as much as 25 per cent. of slack is used, effecting a considerable saving in the cost of material.

The Municipal Process.—The first works to adopt this process, frequently called the Tessié du Motay process, were the Municipal Gas-Works of New York. In the Lowe process,

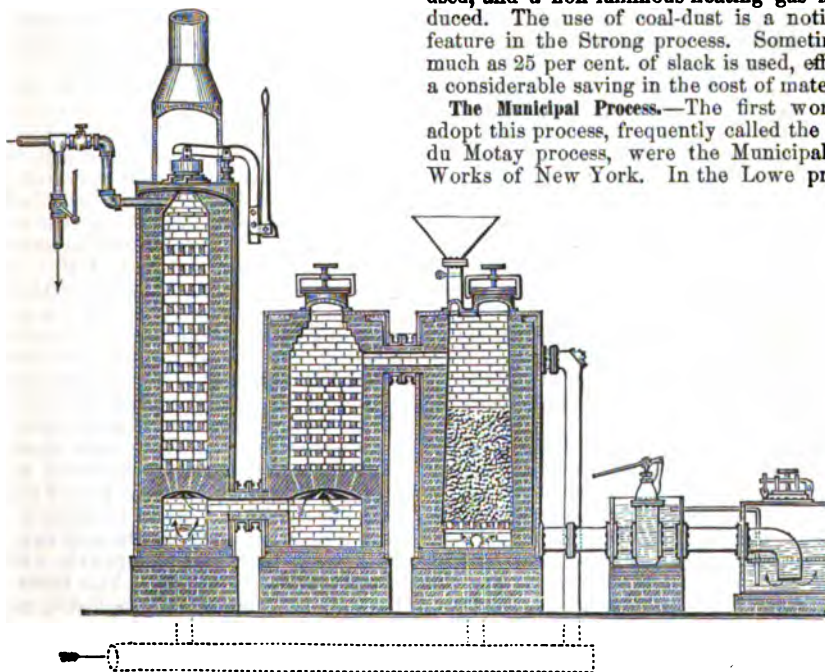

FIG. 2.—STRONG PROCESS.

ing that the heating is taking place, the course of the operation is the same as that already described for the Lowe process. When the heating period is over, the air is shut off and steam is admitted, but the steam enters the apparatus at the farther end of the regenerating cupola. It passes through all the intensely heated brick

the whole operation of gas-making is one, and can not be divided into steps. The Municipal process, on the other hand, divides itself into three phases: gas-generating, carbureting, and roasting or fixing. The division makes the process susceptible of closer watching and more accurate adjustment. Whether this advantage

compensates for its greater complexity, and less rational application of heat, is an open question. Theoretically, it is the most imperfect of the systems; practically, it seems to be nearly or quite as good as any. Its expensive apparatus is its worst point. Hydrogen or water-gas is generated just as in the other processes, by alternate admission of air and steam into the lower part of a cupola-furnace filled with incandescent anthracite. When air is admitted to blow up the coal, a valve on the top of an outlet-pipe is opened, and the products of combustion are suffered to escape into the air, burning with a blue flame, six or eight feet high. All this heat goes to waste. After half an hour's blowing, air is turned off and steam admitted. The flame escaping from the top of the cupola quickly changes in appearance, becoming more voluminous and reddish. The top valve is then closed, and the hydrogen passes on through a water-seal into a small gas-holder. From the gas-holder it goes to a carbureter. This is an iron vessel resembling in principle a Coffey's still. It is full of trays, and naphtha, admitted through its top, pours down within it from tray to tray. The sides of the carbureter are double, and filled with water, kept hot by steam. The gas, when carbureted, passes on to benches of retorts. The retorts are what are known as through retorts. They go completely through the furnace, forming fire-clay pipes about 12 by 20 inches in size, of \cap shape usually. They are kept at a good red heat, and the gas passing through them becomes fixed. With regard to the hydrogen-holder, although we spoke of the gas going to it, this was not absolutely correct. The holder in question is usually very small, and only acts as a compensator, taking in gas sometimes for an excessive production of hydrogen, at other times remaining stationary, or delivering a small amount. As the adjustment of the carbureting process depends upon the even delivery of hydrogen, the holder is made single-lift to preserve uniformity of pressure.

It will be noticed that, in describing the water-gas processes, nothing has been said of the operations of condensing, scrubbing, or purifying. As soon as the water-gas is made, the distinctive peculiarities of the process end, the subsequent treatment being identical with that to which coal-gas is subjected. For this reason, in the illustrations water-gas apparatus alone is shown. The gas is passed through air or water condensers of any of the usual well-known types, and then through washers or scrubbers. The necessity for washing water-gas would seem less than in the case of coal-gas, as it contains no ammonia, yet it is done. It is then purified by lime.

In the Municipal process fuel is consumed in three places—under the boilers, in the gasogens, and in the retort-furnaces. In the Lowe process one of these sources of expenditure of fuel is cut off; there are no retort-benches to

be heated. Theoretically, it is the more perfect process of the two.

The trouble with water-gas is the production of naphthalene. Fortunately, this does not go outside of the works, and it is disposed of there in various ways. It is dissipated by steam, or is dissolved in naphtha, and thus pumped out of the siphons. A strong solution of naphthalene is sometimes obtained, that deposits on evaporation large quantities of the objectionable crystals in a solid mass.

Other methods have been devised for the production of this gas, but the principal types follow the ones described. Retort processes have been used to some extent. In these, anthracite coal is charged into retorts, heated by a fire just as in ordinary coal-gas making, and steam is passed through, becoming decomposed into hydrogen and carbonic oxide. The direct heating, the best characteristic of the water-gas process, disappears; but for small works such processes are quite available.

With regard to the economy of the different water-gas processes, they appear at the present prices to have rather the advantage over coal-gas. Yields varying from 85,000 to 50,000 cubic feet of gas per ton of anthracite coal are claimed; while four and a half to five gallons of naphtha or raw petroleum are required to carburet 1,000 cubic feet.

Wood-Gas.—One works in New York has adopted wood as one of its sources of gas. It has the same objection that attaches to water-gas—it contains a large percentage of carbonic-oxide gas. As it is of very low illuminating power, it has to be enriched with naphtha. The process has been little used.

To give some idea of the importance of water-gas, it need only be said that in New York alone something like 1,500,000,000 cubic feet of it are made annually. Of this quantity, nearly one third is carbonic oxide, so that its practical harmlessness is pretty well proved.

Other Gas Apparatus.—The past few years have witnessed the completion of some extraordinarily large gasometers, or gas-holders, as the gas-engineer more correctly calls them. One in London, the largest in the world, has a capacity of 5,500,000 feet; in New York there is one at the Municipal Gas Company's works, with a capacity of 2,000,000, and two at the New York Gas-Light Company's, with a capacity of 1,500,000 each. The latter works have also the largest station-metre, as far as drum capacity is concerned, in the world. Each revolution of the drum passes 8,000 cubic feet of gas.

Gas-Stoves.—This industry has developed, even in this country, where gas is comparatively dear, into a business of considerable extent, and their construction has been improved upon until they are as good in every respect as coal-stoves. In England vast numbers of them are in use; but there several conditions make their introduction easier. Gas is far cheaper there than here, and coal is not so

much cheaper relatively. Thus, for cooking, they are quite economical. Even here they are nearly as economical as coal-burning ranges, on account of their immediate lighting and extinguishing. No kindling-wood is required, and no fuel is used except what is required for the operations of cooking.

Gas-Engines.—A great deal of work has been done in this field by inventors, and a number of engines are in the market. Their advantages for small and intermittent power are great. They start at once into full action, are immediately stopped, use no fuel except when running, and require no engineer. They are much more bulky for the same power than coal-engines, but far excel the latter in economy. There is a certain amount of trouble in starting them, but it is a minor disadvantage. Twenty cubic feet of gas per horse-power per hour is as low as the best of them can go. They have frequently been used for running dynamos, but the electricians complain of their want of steadiness.

Natural Gas.—The use of gas from gas-wells in the petroleum-fields has grown into an industry of some importance. Several towns are now lighted with it, and it is used also for stoves and fires. For many years it has been used under the boilers at petroleum-wells, many of which produce it.

Gas-Burners.—The great improvement in this regard refers to regenerative burners, which will be found described under their proper heading.

General Observations.—For many years a fierce war has been waged between water-gas or naphtha-gas and coal-gas. To-day, in spite of its success, water-gas is still the subject of controversy. It has certain objections. It contains about one third of its volume of carbonic oxide gas, and this constituent makes it unquestionably more poisonous to those unfortunate enough to inhale it. Its higher specific gravity, combined with its usually high illuminating power, causes less of it to be consumed *pro rata*. Where it has been substituted for coal-gas in entire districts, the gas delivered has run down in quantity very seriously. It might be supposed that this trouble was curable by making it of lower illuminating power, and increasing the pressure. But when of less than twenty candle-power the gas-flame is too white and cold-looking, and to make it of good appearance a high illuminating value must be maintained. But where the quantity consumed by the individual decreases, an inducement is offered to others to burn it, and by giving more light for the same money a healthful impetus is given toward an increase of consumers. The use of uncarbureted gas for heating purposes has been tried to a limited extent, but the necessity of two sets of mains, one for heating and one for illuminating gas, has operated to prevent its introduction to any large extent. It possesses about half the heating power of illuminating gas, and, if an incandes-

cent burner could be devised by which it could be made light-producing, we might hope to soon see its introduction on a large scale. Such burners have been tried, but a successful and practical one is yet to be invented.

GAS-LIGHTING, REGENERATIVE SYSTEM OF. Comparisons of the cost of gas and incandescent electric lighting, and the forecasts of the relative industrial position of these two modes of illumination, have so far been based upon the results at present obtained with the former illuminant. While it has long been known that the consumer realized but a portion of the light which the gas was capable of giving when burned under the best conditions—that is, with clean burners and proper pressure—it has not been supposed that results surpassing these latter were practicable. Recent progress, however, in the construction of burners has shown that gas-lighting has by no means reached its limit, but that results are obtainable which are much beyond anything that could have been reasonably expected but a few years ago, and which may enable gas to hold its own as an illuminant against all comers. This progress consists in applying to gas-lighting the regenerative principle, long and successfully adapted to the industrial applications of fuel, chiefly in metallurgical operations. The essential feature of this system is, the utilizing the heat of the escaping products of combustion—which would otherwise be wasted—in raising the temperature of the air entering to support combustion, as also that of the combustible.

Whatever the system of illumination, the light is always due to the incandescence of a solid body. This solid body may be a fine wire or filament of a suitable material, as in the incandescent electric light, or a piece of lime plunged into a non-luminous flame, as in the lime-light, or may consist of innumerable fine particles of carbon distributed through the flame. This latter is the condition realized in all the luminous flames, whether of oils or gas. Such a luminous flame consists of a body of inflammable gases which are either non-luminous, as hydrogen or carbonic oxide, or which are but feebly luminous, such as marsh-gas, and a small percentage of heavy hydrocarbons to which the luminosity is due. These latter consist of hydrogen and carbon in chemical union, the carbon of which is set free by the heat of combustion. To these glowing particles of carbon, detained momentarily in the envelope of burning gas, and excluded from the air, the light of the flame is due. That the light yielded may be the greatest possible, these carbon-particles must be raised to the highest attainable temperature. How important this is, will be understood when it is remembered that the amount of light yielded by any incandescent body increases much more rapidly than the temperature as this latter is raised. The precise relation between the light and the temperature has not been determined, and probably would not be found capable of

expression by a simple formula. All bodies begin to be self-luminous (so that they can be seen in the dark) at a temperature a little under 1,000° Fahr., while 2,500° Fahr. is probably the temperature of a gas-flame. In this case, while the temperature has been increased

creased, but within the limits of increase at our command the light certainly augments in a vastly greater ratio than the temperature. Dr. John W. Draper found that the light yielded by a strip of platinum-foil at a temperature of 2,600° Fahr. was 86 times that given by the same body when raised to only 1,900°; and experiments with the incandescent electric light have shown that an increase of the current energy—which in this case is all expended in the production of heat—of from 28 to 87 per cent. was sufficient to double the light of a 16-candle lamp. The exceeding brilliancy of the arc-light is due to the enormous temperature to which a small mass of matter is raised.

In the electric light, whether arc or incandescent, the temperature attainable is limited solely by the power of the incandescent material to resist the disintegrating effect of high temperatures, but in all forms of lights due to combustion this limit is imposed by the combustible itself. The maximum temperature which can be obtained with a hydrogen-flame burning in air is about 2,000° C., and with carbonic oxide a few degrees less, while, as stated above, the actual temperature attained in a gas-flame as ordinarily burned does not much exceed 2,500° F., or 1,371° C. The lower temperature in this latter case is largely due to the cooling of the flame by its exposure to the air, and consequently, if this cooling can be avoided, the amount of light yielded by a given flame ought to be greatly increased. This the regenerative burners have shown to be the case, and further, that the increased effect is in proportion to the completeness with which this is accomplished. Large burners, in which the surface of flame exposed is smaller in proportion to the gas burned, and the cooling effect consequently less, give results considerably higher than those realized in smaller burners.

While the principle might seem easy of application, practically it has not been found to be so, and it is only in the past few years that satisfactory commercial apparatus has been constructed. A burner, in which a portion of the air supplying the flame was heated, was described by an Englishman named Young as long ago as 1854; and experiments were conducted by Frederick Siemens, to whom the successful application in recent years is due, fully twenty years ago. Mr. Siemens did not succeed in his early experiments, and the subject was abandoned by him, until the advent of the electric light turned his attention to the production of powerful foci of light by means of gas. In a lecture delivered in the latter part of 1879 before the Society for the Promotion of Industry in Prussia, Mr. Siemens describes several forms of apparatus in which he had endeavored to carry out the principle. The lamp shown in Fig. 1 illustrates the

FIG. 1.

2½ times, the light has increased more than a hundred-fold. This ratio of increase does not hold as the temperature is still further in-

mode in which this was done. A bunch of ordinary flat flames are inclosed in a glass globe, which is wholly closed except at the base, which rests upon a column provided with passages for the admission of fresh air and the exit of the products of combustion. These latter, rising from the flame, encounter the obstruction offered by the globe and are turned downward, following the inner wall of the globe, as this is the coolest path. They then pass downward through the annular space marked 3, 3, and by a flue out of the apartment. The entering fresh air passes upward through the an-

Fig. 2.

nular space marked 1, 1, to the flames, and the gas through the central space 2. The heat of the escaping products of combustion is stored up in the metal surfaces of the burner, and the gauze or perforated metal

with which the passages are filled, to be given out to the entering air and gas.

In his earlier experiments Mr. Siemens supposed that separate passages would have to be provided for the products of combustion and air in the globe, and the difficulty of accomplishing this was the chief reason of his abandoning the project. Later experience with regenerative furnaces, as he says in his lecture, showed him that this was not at all necessary, as the paths naturally taken by the air and products of combustion, due to their different temperatures, were well marked. In Fig. 2 is shown a suspended lamp; and in Fig. 3, one arranged for a bracket. In this latter the air enters at the lower side of the regenerator, and the products of combustion pass out at the upper. Mr. Siemens suggests that the regenerator be slowly rotated, so that the passages

Fig. 3.

heated by the products of combustion will be successively traversed by the entering air. An increase of six times in the illuminating power of the gas was claimed by Mr. Siemens for this apparatus, but this must have been a considerably exaggerated estimate, as it appears to have been entirely abandoned in favor of a burner of different construction, the best yield of which does not reach more than half that result.

This latter burner is shown in Figs. 4 and 5. It consists essentially of a central annular chamber, B (Fig. 4), down through which the products of combustion pass to an escape-flue, G. The gas issues from the upper ends of a ring of small copper tubes, one fifth of an inch in diameter, surrounding this central chamber. The air to support the combustion enters through the annular space C, between the central chamber and an exterior casing. The central regenerative chamber, as well as the annular air-space, is packed with a filling presenting an extended surface to the hot gases and entering air, so that there is a very perfect interchange

of heat. The length of the luminous flame is governed by a porcelain cylinder which rests upon the top of the central chamber. The flames sweep upward around this, and downward over its upper edge, presenting a beautiful ball of flame. Two notched plates at the level of the gas-orifices serve to divide the upward column of air, and cause it to impinge upon the flame. When the burner is first lighted, the products of combustion pass directly upward through the chimney *d*, and out by the

adopted, the side draught-pipe is retained, but, instead of the closed chimney *d*, the flame is surrounded by a short glass cylinder, which simply serves to protect the flame from side-draughts,

FIG. 4.

escape-flue E. But as this becomes heated, the draught through the pipe G becomes sufficiently powerful to draw the flame downward. Some little time has to elapse before this takes place, and the burner therefore can not be turned on full at once. In Fig. 5, the side draught-pipe G is replaced by a central pipe, H; otherwise, the construction is the same. In the form finally

FIG. 5.

the ascending current of hot air being strong enough to control the form of the flame.

Experiments made in France with this burner, with twelve-candle gas (twelve candles to the five-foot), showed the results given in the following table:

NUMBER OF BURNER-TUBES.	Consumption per hour.	Light produced in carrels.	Gas burned per hour and per unit of light.
10	Litres. 150	2 to 3	Cubic feet. 1.75 to 2.6
15	250 to 300	6 to 7 carrels	
18	650	15	1.4 to 2
24	800	20 to 21	
32	1,605	46 to 48	1.8 to 1.4
48	2,200	72	
			1

English experimenters found that, with the London sixteen-candle gas, results were obtained varying from 5.80 candles per foot to 7.18, while in this country careful tests have shown, with eighteen-candle gas, as high a result as ten candles per foot, in burners consuming 50 feet an hour. This result is nearly three times that obtained with the ordinary flat flame. Burners of such large consumption are of course suitable only for the lighting of streets, areas, and large interiors, and hence this great economy is not attainable by the ordinary consumer. While the small burners give a decided advantage over the ordinary domestic lights, still the cumbersome of the lamp and the care required in operating it render it unsuitable for domestic lighting.

Other inventors have, however, taken up the problem, and, working in the direction pointed out by Siemens, have succeeded in producing burners well suited to domestic lighting, and free from the objectionable features of the Siemens. A burner of this kind has been brought out in England by Mr. Grimston,

obstructed by any portion of the fixture. The construction is shown in Fig. 6. The burner consists of a ring of tubes, *a, a*, arranged within an annular casing, *b, b*. Lateral tubes, *c, c*, connecting the casing, *b, b*, with a concentric outer one, admit air to the flame. The annular space crossed by these tubes constitutes the flue through which the products of combustion pass upward to the chimney *e'*. A glass globe, *d*, made with an indentation or nipple at its center, incloses the flame, which takes the form of an inverted convolulus. The extraction of heat from the escaping products of combustion is so complete that the air, it is claimed, reaches a temperature of from 1,100° to 1,200° Fahr. The burner may be turned on full at starting, and is not liable to smoke. It therefore requires no more attention than any ordinary flat flame. It can be constructed of any size from three-foot upward, and is reported to yield almost as good results in the smaller as in the larger size. In burners consuming twenty feet an hour, the light yielded per foot of gas is seven candles, or just double that given by the standard Argand, consuming five feet an hour, and the results in the smaller burners are but little short of this.

A burner which can be made in small sizes, and is therefore suitable for domestic lighting, has also been brought out in this country by Mr. A. B. Lipsey. It may be briefly described as an inverted Siemens burner. It consists of a central flue, provided with a cylindrical porcelain extension at its lower end. The burner is an inverted Argand encircling the central flue, the flames from which burn downward around the porcelain, and turn upward and inward at its lower edge. The air to support combustion is admitted through an annular space above the flames, formed by the wall of the central flue and an outer casing. A globe fitting tightly against a flange or plate just above the burner-tips incloses the apparatus. This design does not admit of as high heating of the air as either the Siemens or the Grimston, but the downward burning of the gas secures complete combustion, and the results obtained compare favorably with them. No tests have been made of the later and more perfect burners, but those made with two sizes of some of the first burners constructed gave, for a burner consuming 8.50 feet an hour, 4.62 candles per foot with 17.47-candle gas, and 6.52 candles per foot with a 23-foot burner with 17.05-candle gas.

The results so far obtained with regenerative burners make it reasonably certain that, with the sizes suitable for domestic illumination, a lighting effect double that now obtained can be depended upon. Such a burner as the Grimston is universally applicable, and as there is nothing about it to get out of order, and it requires no more attention than the ordinary flat-flame burners, there seems to be no impediment to its wide introduction. As burners of this kind lend themselves readily to sanitary

FIG. 6.

an electrical engineer in the employment of Siemens Brothers. The body of the burner, instead of being below the flame, as in the Siemens, is placed above it, and the flame burns downward, the light being wholly un-

demands—now everywhere becoming recognized as imperative—since the products of combustion may be conveyed out of the apartment, they at once remove one of the most formidable objections to gas-lighting. They also solve the problem of cheap gas, as the doubling of the illuminating power of a given amount of gas is equivalent to halving the price. The introduction of so great an economy in the burning of gas can not but profoundly modify the commercial status of the gas industry, and alter greatly its prospects of permanence as an illuminant.

GEOGRAPHICAL PROGRESS AND DISCOVERY.

Arctic Regions.—The Arctic campaign of 1888 opens a new era, in which investigation is directed to the solution of physical problems rather than to discovering new islands or seeking an approach to the pole. The plan of international circumpolar stations was the idea of the late Lieutenant Weyprecht, the discoverer of Franz-Josef Land, and was warmly seconded by Count Wilczek, the patron of his famous expedition. After its discussion at the Meteorological Congress at Rome, at the International Polar Conference at Hamburg in 1879, at the second meeting of the same at Berne in 1880, and at the third meeting at St. Petersburg in 1881, it passed into the hands of the governments which promised to establish the several observatories. Prof. Wild, of St. Petersburg, President of the Polar Commission, announced in May, 1881, that the eight stations required were provided for. The simultaneous observations were to be begun as soon as practicable after August 1, 1881, and to continue until Sept. 1, 1888. Denmark arranged to establish a station at Godthaab; America took up the northernmost position in Smith Sound, on Lady Franklin Bay; Germany chose Cumberland Sound, on the west side of Davis strait; England located its observers in the center of the Hudson Bay territory at Fort Rae, near the Great Slave lake; a second American station was established at Point Barrow; Russia occupies the mouth of the Lena, with a branch station at Möller Bay, in Nova Zembla; Norway selected Bosekop, in the Alten Fjord; Holland chose Dickson's harbor; Sweden took Spitzbergen; and Austria sent observers to the gloomy island of Jan Mayen. The Finnish Government fitted up a meteorological station at Sodankyla, on the Scandinavian isthmus, the Helsingfors Observatory furnishing the magnetic observations. Germany determined to dispatch an observer to the coast of Labrador, which extends along the line of minimum depression, with the expectation that he would obtain the assistance of Moravian missionaries. France undertook simultaneous observations in the Antarctic regions, establishing a station near Cape Horn. Germany aids in the investigation of Antarctic phenomena, having sent out an expedition to one of the islands of South Georgia, in 54° 30' south

latitude, and 41° 20' 15" west longitude. These two stations in the southern hemisphere are to be aided by the observatories at Cape Town and Melbourne. The investigations of the fifteen principal and branch stations are supplemented by meteorological and magnetic observations taken on the 1st and 15th of every month at various permanent observatories in the temperate zone and within the tropics, as well as upon naval and merchant vessels. The English Government co-operates with the International Polar Commission by undertaking to tabulate the daily meteorological phenomena of the North Atlantic Ocean as reported by seamen, who are invited to send in the data to the Meteorological Office. The subjects of inquiry, which are obligatory at all the international stations, are meteorology, magnetism, the aurora, and astronomy. Magnetic and meteorological observations are taken hourly during the whole time, and on the 1st and 15th of each month magnetic observations are made synchronously at all the stations, every five minutes. The magnetic investigations embrace the three elements of declination or variation, inclination or dip, and intensity. Most of the stations are within the belt, whose pole is at one side of the north pole, that incloses the region of Arctic magnetic phenomena, and is the seat of the luminous arc of the aurora. This circle, called sometimes the "aurora ring," touches the northwest part of Norway, passes south of Iceland and Greenland, across the northern part of Labrador and Hudson Bay territory, emerging into the Arctic Ocean at Point Barrow, touching the Siberian coast only at Cape Chelyuskin, and crossing the northern part of Nova Zembla. Two of the stations, Point Barrow and Bosekop, are on this belt of maximal auroral phenomena, which is believed by many scientists to be the seat of magnetic energy, throwing off electric currents to the north and to the south. The study of the changes in the ice and other physical conditions of the polar basin, is expected by eminent meteorologists to throw much light on the movements of the wind and the circulation of the ocean. The fact that there are two focal points of extreme cold, one in Siberia and one in the interior of British North America, instead of a progressive lowering of the average temperature up to the geographical pole, is a recent discovery which gives interest to the comparative thermometrical readings taken at the international stations. Besides the obligatory observations in the branches mentioned above, the parties are desired to take observations in many other departments of inquiry, including temperature of the soil, snow, and ice, on the surface and at various depths, evaporation, terrestrial magnetism, galvanic earth-currents, and observations of earth-currents in close connection with magnetic and auroral phenomena, hydrographical, spectroscopical, and pendulum observations, as well as observations on atmos-

pheric electricity, the growth, structure, and motion of ice, the physical properties of seawater, etc. It is also recommended that samples of air should be collected for analysis, besides collections in the departments of zoology, botany, geology, etc.

Successful observations, made by several of the International Polar Expeditions just described, have been reported. Among the members of the Austrian expedition not a trace of scurvy, or any other disease, was found during their long exile of sixteen months at Jan Mayen Land. Wholmuth, the commander, has telegraphed that his observations have been perfect, his collections rich, and his photographs numerous. Capt. Dawson, who commands the English expedition at Fort Rae, reports excellent work by his party. The auroras, he says, have not been of remarkable brilliance, though the spectroscopic observations have been very satisfactory. From the Finnish station at Sodankyla, Herr Sophus Tromholt sends accounts of startling novelties. He has experimented on a gigantic scale with the aurora borealis. By means of an ingenious arrangement of batteries and wires along the face and up the summit of a lofty hill (1,000 feet high) he has been able to produce an artificial aurora differing in no respect in appearance and spectroscopic analysis from the genuine aurora. This phenomenon is one that has puzzled investigators for centuries, and even now the most diverse opinions are entertained as to its origin and nature. These experiments of Tromholt, when combined with the simultaneous observations of various investigators, are likely to go a long way toward the final settlement of the question. Dr. Tromholt has completely failed in obtaining any photograph of the delicate phenomenon, even by using the most sensitive dry plates. Thus, brilliant as the northern lights are, the actual amount of light contained in them is apparently small.

The great interest of the year in Arctic exploration has centered about the efforts made for the relief of Lieut. Greely and his party at the meteorological station in Lady Franklin Bay. This officer had sailed for that point in June, 1881, to establish a colony in accordance with an agreement made by the United States Government, as narrated above. It was expected to maintain this post until 1884, and Lieut. Greely was to be visited by a vessel carrying supplies in 1882 and 1883. If not visited in 1882, he was ordered to abandon his station not later than September 1, 1883, and retreat southward by boat, following closely the east coast of Grinnell Land. In 1882, July 8th, an expedition sailed from St. John's, Newfoundland, but was obliged to return without communicating with the party at Lady Franklin Bay. In 1883 a more determined effort was made for this purpose. The same vessel which carried Greely and his associates, the *Proteus*, was chartered for this service. The United States ship *Yantic* was ordered to accompany

the *Proteus* as far as Littleton island, rendering such aid to the relief vessel as might be necessary. The officers of the *Proteus* were as follow: Lieut. E. A. Garlington, U. S. A., commanding; Albert G. Colwell, U. S. N., lieutenant-commander; Dr. J. S. Harrison, surgeon; Sergeant John Kenny, Corporal Frank Ewell, and six other men, all being detailed for the expedition on account of their service in the Northwest, where they had become injured to the extreme cold. (See *GREELY RELIEF EXPEDITION*.)

The British Circumpolar Expedition, under the command of Capt. Dawson, reached Fort Rae August 30, 1882. This station is on the northern arm of the Great Slave lake. The party, consisting of Capt. Dawson and three soldiers of the artillery, arrived at their destination from Winnipeg, by ascending the Saskatchewan to Prince Albert settlement, crossing the prairie to Green lake, proceeding by way of Buffalo lake and Methy lake, and down the Athabasca river to Lake Athabasca, and then descending the Slave river to Fort Resolution on the Great Slave lake.

The Dutch steamer *Varna* and the Danish steamer *Dijmphna*, which had gone out to explore the Kara Sea, utterly failed in their mission. The former was wrecked in the Kara Sea, while the latter narrowly escaped. The ill success of this expedition is thought to dispose of the notion that there is a practicable northeast route for merchant-vessels from Norway to Bering strait. The Dutch exploring vessel, *William Barents*, left Amsterdam on the 5th of May in search of the *Varna* and *Dijmphna*. This was her sixth Arctic voyage. The *William Barents* was heard from at Archangel on the 21st of June. While she was in the Dwina the weather was beautiful, the thermometer registering over 70° in the shade, and at midnight the temperature was not much lower. Bees hummed through the rigging of the *Barents*, and butterflies lighted on her decks; while the mosquitoes were actively engaged in every corner of the ship.

Capt. M. S. Healy, of the United States steamer *Corwin*, detached Ensign G. M. Stoney on an expedition to explore a large river reported by the natives to debouch into Hotham's inlet, Alaska Territory. A dinghy, with two men armed and equipped with ten days' rations, was placed under Ensign Stoney's command. Proceeding some twenty-three miles along the northwestern shore of the inlet, Stoney at length struck the mouth of a river of considerable size. Ascending this in a southeasterly direction for two days, he struck the main stream, which proved to be a river three quarters of a mile in width, having nowhere less than two and a half fathoms of water. He ascended the river fifty miles from its mouth. The banks were generally thickly timbered with birch, alder, and spruce, some of the trees attaining a height of forty feet, with twelve inches diameter at the base. The natives re-

ported that the river held its depth of not less than two fathoms and its width of half a mile for not less than 800 miles beyond where Mr. Stoney turned back. They further reported that, by making a small portage near the head of this river, they could reach another stream flowing northward into the Polar Sea. The natives, many of whom had evidently never seen a white man before, were kind and harmless.

Baron Nordenskjöld sailed in May for Greenland, with the intention of exploring the interior in order to test a theory of his that, after crossing a belt of ice which skirts the coast, he would find an open country possibly mountainous, and probably covered with forests. He also hoped to find the remains of the ancient colony of Österbygd on the coast east of Cape Farewell, founded by Norwegians in the middle ages. These theories were generally considered chimerical, the interior of Greenland having been found to be covered with one great glacier, and all reports of a plateau free of ice having been considered mere Esquimaux wonder-tales, while the eastern coast is not now habitable, and there is no reason to suppose that there has been any considerable change in its climate during historic times. Baron Nordenskjöld's party was admirably equipped, and included two Esquimaux and a missionary who served as interpreter. The first attempt of his vessel, the *Sophia*, to reach the east coast through the sounds north of Cape Farewell, Ikek, and Ikernsak, failed. She was obliged to put to sea and skirt the outer edge of the great ice-pack which borders the east coast and makes approach almost impossible. For a long time the Baron sought in vain for an opening, but on the 4th of September, being then abreast of Cape Dan, under whose shelter he thought the ice likely to be less closely packed, he resolved to make an effort to work his way through. The belt was two or three miles broad, but happily there was no current, and the *Sophia* succeeded in pushing her way through and reached an anchorage in a fiord free from ice-floes, about latitude 65°. This they named Auleitsivik Fiord and made the starting-point of the expedition. At first their progress was slow, not over two and a half miles a day, but they gradually increased their rate of travel to six or eight miles a day. For a time the land rose in height very rapidly, so that on the ninth day they found themselves 2,400 feet above the level of the sea. From this point the ascent was so gradual that it could be discovered only by means of the barometer. On the eighteenth day an altitude of 4,600 feet was reached. Here Nordenskjöld determined to turn back, but he remained in camp and sent his Esquimaux farther into the interior. They were gone fifty-eight hours and on their return said they had explored a distance of seventy-two miles, and reached an elevation of 8,600 feet. They had seen no trace of land above the surface of the ice, nothing but an unbroken expanse of ice covered four

feet deep with snow. Nordenskjöld now admits that no ice-free land, no vegetation, and no moraine, exist in the interior, at least between 68° and 69°. The absence of protecting coast-ranges, and the gradual rise of the land to a plateau, would be sure to produce an interior covered with ice. Nordenskjöld was equally unfortunate in his archæological researches. The scientific world long supposed that of the two villages founded by the Norsemen, the *Vesterbygd* was on the west coast and the *Österbygd* on the east. Modern research, particularly that of Graah's expedition about fifty years ago, demonstrated that this was an error due to the imperfect reading of the Sagas, and that both bygds were on the west coast, the one a little farther east of the other. Nordenskjöld had refused to accept this later opinion, but the result of his journey confirms it. Such ruins as he found were entirely of Esquimaux villages, and there was no evidence of any other habitations east of Cape Farewell. The expedition was, however, in many respects successful. It reached a part of the coast of Greenland which has not been approached since the days of Eric the Red, for, though north of the Arctic Circle the coast has been often visited, between 62° and 69° it has been so ice-locked as to be unattainable. The observations made during the journey over the ice of the interior have an important bearing on the glacial theories of the geologists, and fine collections were made in geology, paleontology, zoölogy, and botany. In many of the cavities in the ice Nordenskjöld found a muddy sediment which he called kryokonite. He believed it to be formed of dust brought by the wind over the ice, and mixed with a metallic substance which he is convinced is metallic dust from cosmical space. In this kryokonite a kind of fungoid vegetation found a holding-ground. After a very dangerous passage out through the ice-belt, the *Sophia* attempted to reach land again in a higher latitude, but the pressure of the ice was so strong that Nordenskjöld thought the risk too great and shaped his course for Reykjavik. It is considered that a properly-built ship would be able in most years to anchor on the southeast coast, but she would have to seek her place and opportunity with great care, and would not be likely to find a regular "land-water" within the ice-pack. This conclusion is the same as that arrived at by Graah, and more recently by Mourier, and is supported by other Danish settlers and explorers.

South America.—A pass across that part of the Andes that divides Chili from the Argentine Republic has recently been discovered, and is likely to become of great military importance. Hitherto the only practicable passes known have been the *Patos* and the *Cumbre*, those farther north being very difficult of ascent, and in most cases approached over barren regions. The *Cumbre* is the more accessible, but is so narrow and winding as to make it impas-

sable if held by a very small opposing force. Yet the Andes extend over a thousand miles between Chili and the Argentine Republic, with an average elevation of 13,000 feet. Any war between these countries would have to be carried on by sea. The newly-discovered Bariloehi Pass is near Lake Nahuelhaspi, where the continent narrows and forms the peninsula of Patagonia, and is easily approached, while the mountains at this point are not more than half the height of the same range a few miles farther north. Its commercial importance is of the highest. Railroad communication from the Atlantic to the Pacific has long been needed, and a road between Buenos Ayres and Santiago is already in progress, designed to run through one of the difficult passes already mentioned. A road from the Gulf of San Matias, across northern Patagonia, through the Bariloehi Pass, would be only half as long, and would traverse a temperate region, where rain takes the place of the snows of the north. The exact height of the pass is not yet known, but the civil engineers will doubtless soon give the results of their investigations.

Asia.—A new route to Central Asia has been officially opened during the year by Col. Alexandroff and Gen. Tcherniaeff, of the Russian army. The route was discovered by a fish-merchant named Varnishin, who several times crossed it with his caravan. It begins at the Bay Yaman Aurakti, in the Caspian Sea, passes through Khiva, Bokhara, and the Yarafshan, and so reaches Kungrad, a distance of 295 miles. The new route runs through well-populated regions instead of the barren steppes traversed by the old, and except for thirty miles' distance is well watered. Gen. Tcherniaeff intends to sink wells along this part of the course. The road-bed is gravelly and firm. It is suggested that a railroad may some time be made along this new route.

Prof. Ed. Sachan has published the results of his journey in Syria and Mesopotamia, undertaken at the request of the German Emperor. From Beirut Prof. Sachan went by way of Damascus and Palmyra, Aleppo and Biredjik, on the Euphrates, to Urfa, thence to Mosul and finally to Alexandretta. An expedition, under the direction of the Palestine Exploration Society, left England in October with the intention of exploring the Wadi-el-Arabah and the basin of the Dead Sea, and the Jordan valley as far as the Sea of Galilee.

Africa.—The Congo river region has been commanding more and more attention since Stanley began his explorations. The past year has seen additions to our knowledge of its inhabitants and resources, and also very eager discussions as to what nations the protectorate of its commerce belongs to. Merchant-steamers of 5,000 tons can now ascend the river as far as the falls, a distance of 120 miles, and a considerable trade is carried on by English, French, Dutch, and Belgians. Beyond these Falls of Yellala, Stanley discovered the river to be again

navigable, and constructed a hundred miles of road around them. Over this road he has transported three steamers and more than two thousand packages to the middle and upper Congo. In one of these steamers he ascended the Quango, one of the tributaries of the Congo, for a distance of two hundred miles. He has this year gone as far as the equator, and established two more stations. He has also discovered another lake, which he calls Lake Mantumba, and explored the Malundu river for a distance of a hundred miles. He finds it a deep, broad, and navigable stream, draining a country rich in guma, rubber, camphor, ivory, and many other articles of high commercial value. He reports a dense population, very enterprising and industrious. Mr. Stanley mediated successfully between some of the warlike tribes, and received the title of "Father and Mother of the country."

M. de Brazza left Bordeaux on the 28d of March, stopped for a day or two in Senegambia, and reached the Bay of Loango, north of the mouth of the Congo. The Bay of Punta Negra was already in possession of the advance division of his party. The Loango anchorage is considered to be one of the best between the Gaboon and Congo, but De Brazza had hoped to be able to land near the mouth of the Konilon, by means of which communication could be kept open between the French possessions on the Gaboon and territory on the Congo granted by King Makoko. He found Mr. Stanley's agents established there, and was therefore obliged to change his plan. However, instructions had been given the latter that friendly relations were to be maintained with the French, and as yet no difficulty has arisen between the rival parties.

The German explorer, Lieut. Wissmann, has been investigating a region lying south of that traversed by Stanley, but watered by numerous southern tributaries of the Congo. He crossed the continent, starting from St. Paul de Loando and passing through the empire of the Muato-Janvo, a portion of country which is fertile and densely inhabited. The account of these tribes, when published, is expected to prove a valuable contribution to African ethnology.

Mr. Joseph Thompson is engaged in exploring the country from Mombosa to the south-east coast of Victoria Nyanza. He is to include Mt. Kilimanjaro, a peak of great height covered with snow, and Mt. Kenia. To the westward of these mountains, toward the Victoria Nyanza, stretch great plains inhabited by the Masai, a warlike people who are constantly committing depredations upon the peaceful negroes of the coast. Mr. Thompson at latest accounts had fallen upon the track of Dr. Fischer, a German traveler who had roused the hostility of the natives to such a point that Mr. Thompson was compelled to turn back to Taveta. He is in the service of the Royal Geographical Society.

Dr. Emile Riedeck, well known to the scientific world as a traveler and collector, is fitting out an expedition for Northern Africa. It is to be commanded by Herr Gottlob Adolf Krause, an accomplished linguist, and its object is to be the investigation of the languages and social state of the peoples about the Niger, Berne, and Lake Tchad. Herr Krause has spent much time in Africa, and understands languages and dialects spoken between Sehan and the upper Senegal. He intends to follow the Niger to a distance of three hundred miles, and then choose some locality as the center of his base of operations. His explorations will include the east and central territory of the Felata Fulbe, and that of the Hausa Musuk tribes.

Diligent explorations in the Welle region are being carried on by travelers of various nationalities. Lupton Bey, an Englishman occupying the post of Egyptian governor of the Bahr-Gayal district, has reported the discovery of a great lake which he believes to be the basin of the Welle; and Dr. Yunker, a Russian, is exploring the course of the same stream. The Welle was long supposed to be a tributary of the Congo, and to pour its waters into Lake Tchad. This is now supposed to have been an error, and it is surmised that some great discovery will soon reform our geographical notions of that part of Africa. The Royal Geographical Society reports constant explorings of the unknown central parts of the continent farther south and east. The Belgians have a station at Karema on Lake Tanganyika, and travelers from the east coast are constantly arriving there. An exploring party of Germans are at work between Karema and Tabora, and the French are equally busy on Lake Bangweolo. Mr. James Stewart has constructed a road between Lakes Nyassa and Tanganyika, and a steamer in sections is already on its way to these lakes. Mr. Johnson and Mr. O'Neill are making maps of the region between the Mozambique coast and Nyassa. Capt. Paiva de Andrada is surveying the districts about the lower Zambesi, and Mr. Selons is similarly engaged between the Zambesi and the settlement of the Matabele, while Lord Mayo is engaged with the country between Mossamedes and Ovampo Land.

Count Antonelli, a nephew of the late cardinal, has returned from his adventurous trip to Assab and Shoa, and has given his country an honorable rank among the many nations pushing forward the work of discovery and exploration. Antonelli set out from Yeila, a port eighty or ninety miles south of the Straits of Bab-el-Mandeb, his first object being to reach the Italian traveler, Cecchi, then a prisoner in Shoa. He traveled by way of Irya Somali and the Darakil country, making a long *détour* northward on the Blue Nile. He determined to make an effort to open a new route to Ankober by way of Assab and Aussa, an undertaking which has cost several explorers their

lives, the native tribes being fiercely hostile. In spite of this hostility, Antonelli succeeded in making friends with the Sultan of Aussa, Mohammed Aufari, and obtained a passport to the good-will of the nomad tribes in the shape of a walking-stick, the mere sight of which procured from the Darakils mules, guides, and provisions. He accomplished the journey—a distance of five hundred miles—in three months and seventeen days. At Ankober he was kindly received by the king, Menelik, whom he found to be greatly influenced by the Italian bishop Massaia. Menelik sent to King Humbert a parcel containing specimens of the products of Shoa—seeds, ivory, berries, etc. Count Antonelli is of the opinion that Shoa is a better field for commerce than Abyssinia, it being the key to districts which are very rich in coffee, sugar, spices, and ivory. He is already planning another expedition to this important region.

Dr. Lenz has given the following description of the commerce of Western Africa: Morocco, which is a land richly endowed by nature but kept poor by misgovernment, has no export trade with Europe, because the export of grain, horses, cattle, and cork-bark, articles produced in abundance, is forbidden. The large importations of sugar and candles from Marseilles, and of green tea and dry goods, are balanced by the re-export of the same commodities to the Soudan. A caravan-journey to Timbuctoo takes three months. The caravans bring back mostly slaves, which find a market along the Barbary coast. Timbuctoo, the emporium of the Soudan trade, is visited by from 40,000 to 50,000 loaded camels yearly. The principal standard of value there is salt, which is brought in uniform cakes, weighing sixty pounds, from the Sahara. They have, however, a gold coin, and also Spanish dollars. For small change they use cowries, at the rate of 3,000 or 4,000 to the dollar. The money comes from the French stations on the Senegal and is exchanged mostly for India-rubber, which is obtained in the vast mimosa-forests. The French possessions in the interior are confined to a series of forts on one bank of the Senegal, garrisoned with Algerian and recently also with native soldiery, composed of purchased slaves, who are liberated after six years of service, after which they usually hire out to traders. The Senegal is navigable only as far as the military station Médine, sixty miles from the mouth, where rapids block the passage. A line of forts has recently been established from Médine in the direction of the Niger, and would be carried farther but for the hostility of the negro kingdom of Segou, which has been not long converted to Islam. The forts are all connected by telegraph with St. Louis, at the mouth of the Senegal, and work has been begun on a railroad from Médine to the Niger. The trade of St. Louis consists chiefly of India-rubber and peanuts. From the latter oil is extracted in Bordeaux and Marseilles,

which is sold in immense quantities as olive-oil. The English control the trade of the Gambia and the countries to the southeast. The republic of Liberia is described by Dr. Lenz as corrupt in its government, and extremely modernized in its social conditions. It is rich in coffee. Here begin the gold-diggings, which farther east have lately begun to be exploited with the newest appliances by a number of joint-stock companies. The Gold Coast has already a large export trade in palm-oil, of which Lagos is the center.

Madagascar.—The latest explorer in Madagascar is Audebert, a German zoologist, who was sent out by the Zoological Museum at Leyden, and, after the five years of his contract expired, remained two more on his own account, returning in 1882. During his sojourn on the island the Englishmen, Gerard and Grossley, the Frenchmen, Humblot and Majastre, and the Germans, Rutenberg and Hildebrandt, died there from hardships and fever. The Hovas he found treacherous and jealous, and the inland tribes hostile and savage. He was once poisoned, and was attacked five times, and his hut was fired thrice. He was deserted by his porters in the midst of a forest, and twice he rescued his life only by swimming. Besides his discoveries in natural history, comprising seventeen new species, Audebert enlarged the ethnological knowledge of the island. While searching for a mysterious animal—an ass with long, hanging ears—which he was told lived in the north by the people in the south, and in the south by those in the north, he came upon the Voilakertras, a tribe hitherto unknown. They are a bellicose and predatory people, of whose ferocious qualities he was warned on all sides, but whom he found to be superior to their lying, indolent, and cowardly neighbors. They are excellent husbandmen, but constant wars interfere with their prosperity. He was received cordially by their king, Lambohazi, and would have staid longer if a war which was going on did not render his situation precarious. They dwell in the upper valley of the Manambato. The Valaves, another undescribed tribe, possess all the evil qualities attributed to the Voilakertras. Another tribe unknown to Europeans is the Sazoras, a branch of the Taifasy family in the southeast.

GEORGIA. State Government.—The following were the State officers during the year: Governor, Alexander H. Stephens, succeeded by James S. Boynton and Henry D. McDaniel, Democrats; Secretary of State, N. C. Burnett; Treasurer, D. N. Speer; Comptroller-General, William A. Wright; Attorney-General, Clifford Anderson; Superintendent of Public Instruction, G. J. Orr; Commissioner of Agriculture, J. T. Henderson; Railroad Commissioners, J. M. Smith, Campbell Wallace, and L. N. Trammell. Judiciary, Supreme Court: Chief-Justice, James Jackson; Associate Justices, Martin J. Crawford and Samuel Hall.

Gubernatorial Succession.—Gov. Stephens died on the 4th of March, and on the 5th James S. Boynton, President of the Senate, took the oath of office as his successor.

The law provides that, after the death of the Governor, the President of the Senate, acting as Governor, shall order an election for Governor, to fill the unexpired term.

Gov. Boynton immediately ordered an election for the 24th of April, and convened the Legislature for the 9th of May. The Democratic State Convention met in Atlanta on the 10th of April, and after a session of several days nominated Henry D. McDaniel, his chief competitors having been Gov. Boynton and A. O. Bacon. Mr. McDaniel was elected by a light vote, without opposition, the figures being 23,630 for McDaniel and 834 for others. The Legislature having convened, pursuant to the call, Gov. Boynton transmitted a message reciting the death of Gov. Stephens, and his action in the premises, and giving the following information:

The resolution of the General Assembly, authorizing the sale of the \$160,000 of United States registered bonds received by the State from the purchasers of the Macon and Brunswick railroad, has been enforced, and a most advantageous sale was made by the Treasurer in New York. The bonds brought \$180,200, or a premium of \$20,200 on the bonds for the benefit of the State. The cost of the sale was only \$100 brokerage and the treasurer's expenses less than \$100. This money will be devoted to paying the public debt. In addition to this, \$114,000 of bonds not yet due, paid by the purchasers of the Macon and Brunswick railroad, have been canceled and warrant given for the same. This included \$74,500 of the 7 per cent. bonds issued by Gov. Jenkins to rehabilitate the State road, due in 1886, and \$39,500 of 6 per cent. State indorsed bonds of the Savannah and Gulf railroad due in 1886, 1887, and 1889. The reports of the Treasurer show that in addition to these items the sum of \$367,971 of the public debt of the State, principal and interest, has been paid in the last few months, steadily reducing the State's debt, and demonstrating the solid integrity of the State's credit, as well as the advancing value of her securities.

On the 10th of May Gov. McDaniel was inaugurated, and the Legislature adjourned.

Legislative Session.—The Legislature met in adjourned session on the 4th of July, and adjourned on the 26th of September. From the message of Gov. McDaniel to this session the following extracts are taken:

I regret to inform you that the Treasury Department of the United States has declined to pay the sum of \$35,555.42 appropriated by Congress in the act approved March 3, 1883, "to refund to the State of Georgia certain money expended by said State for the common defense in 1777." The First Comptroller of the Treasury has decided that this sum shall be credited on account of what is claimed to be due for the quota of direct taxes, apportioned to the State by the direct tax act of Aug. 5, 1861. This decision is, in my judgment, erroneous; and I have notified the Secretary of the Treasury that the State does not acquiesce in it. If the taxes claimed are due, the obligation is upon the citizen, and not upon the State, which has never assumed the payment of the taxes, and can not be justly charged with them. All proper means will be used to secure the payment of the sum appropriated for the benefit of the State.

An embarrassing question has arisen in the taxation

of personal property of railroads located partly within this State and partly in another State. The realty and the personalty located in this State must, of necessity, be taxed in this State. But much of the personal property of such railroads is located in this, or another State, only by reason of the rule of law which fixes the *situs* of personalty at the domicile of the owner; or in case of a railroad, where its principal office is located. In practice a difficulty arises, because adjoining States claim the right to tax such proportion of the entire personalty as the number of miles of railroad located within their limits bears to the whole number of miles in both States. This would seem to be the rule of convenience, as well as of justice, and I recommend its adoption.

The subject of taxation can not engage too much of your attention. Equality and uniformity are substantially secured, in theory, under our system. But experience proves that our laws for ascertaining the property liable for taxation, and its value, are defective; its aggregate value being largely in excess of the annual returns. . . . We collect from the people of Georgia, for State and county purposes annually, less than one dollar and twenty-five cents per capita.

There were passed at this session an act to redistrict the State for congressional purposes, and an act prohibiting the running of Sunday excursion-trains. Among bills which failed to pass were those providing for tax-assessors, establishing a school of technology, and the general dog law. The general temperance bill failed to pass, but more than seventy special temperance bills passed. The congressional districts consist of the following counties:

1. Chatham, Effingham, Scriven, Emanuel, Bullock, Bryan, Tatnall, Liberty, McIntosh, Glynn, Wayne, Appling, Pierce, Camden, Charlton, Ware, Clinch, Echols.
2. Baker, Berrien, Brooks, Calhoun, Clay, Colquitt, Decatur, Dougherty, Early, Lowndes, Miller, Mitchell, Quitman, Randolph, Terrell, Thomas, Worth.
3. Coffee, Dodge, Dooly, Irwin, Telfair, Montgomery, Laurens, Pulaski, Wilcox, Houston, Macon, Sumter, Schley, Webster, Stewart, Lee.
4. Taylor, Talbot, Marion, Chattahoochee, Muscogee, Harris, Heard, Troup, Meriwether, Coweta, Carroll.
5. Clayton, De Kalb, Fayette, Fulton, Henry, Newton, Rockdale, Spalding, Walton, Campbell, Douglas.
6. Bibb, Crawford, Upson, Pike, Monroe, Twiggs, Wilkinson, Jones, Baldwin, Butts, Jasper.
7. Bartow, Catoosa, Chattooga, Dade, Cobb, Floyd, Gordon, Whitfield, Murray, Polk, Paulding, Haralson, Walker.
8. Hancock, Putnam, Greene, Morgan, Oconee, Clarke, Oglethorpe, Wilkes, Elbert, Madison, Hart, Franklin.
9. Banks, Cherokee, Dawson, Fannin, Forsyth, Gilmer, Gwinnett, Hall, Habersham, Jackson, Lumpkin, Milton, Pickens, Rabun, Towns, Union, White.
10. Johnson, Jefferson, Burke, Glascock, McDuffie, Richmond, Columbia, Lincoln, Washington, Warren, Taliaferro.

Acts were also passed as follow:

Appropriating money for completing and furnishing the State Lunatic Asylum; providing for the erection of a State Capitol building; providing that all property owned by any railroad corporation of the State not used by it in carrying on its usual and ordinary business, shall be taxable by the counties and municipal corporations in which such property is situated; providing that all railroad companies operating railroads lying partly in Georgia and partly in other States shall be taxed on so much of the whole value of the rolling-stock and other personal property appurtenant thereto as is proportional to the length

of the railroad in Georgia; and providing a more correct and efficient mode of taking the enumeration of the school population.

FINANCES.—Following are the receipts and disbursements from Sept. 5, 1882, to Sept. 6, 1883:

Balance in Treasury Sept. 5, 1882.....	\$728,479 67
Paid in last quarter of 1881.....	727,506 48
Paid in first quarter of 1882.....	688,902 27
Paid in second quarter of 1882.....	144,869 20
Paid in third quarter of 1882.....	158,099 26
Paid in fourth quarter of 1882.....	688,825 22
Paid in first quarter of 1883.....	965,217 54
Paid in second quarter of 1883.....	175,764 90
Paid in fractional third quarter of 1883.....	106,565 95
Total.....	\$3,754,966 49
Paid out last quarter of 1881.....	\$589,490 61
Paid out first quarter of 1882.....	122,765 06
Paid out second quarter of 1882.....	731,417 16
Paid out third quarter of 1882.....	857,804 68
Paid out fourth quarter of 1882.....	117,188 41
Paid out first quarter of 1883.....	500,916 45
Paid out second quarter of 1883.....	528,505 89
Paid out fractional third quarter of 1883.....	100,855 20

Total.....\$3,054,944 02
Sept. 6, 1883—Balance in Treasury on this date. \$699,419 47

The increase in the taxable property in the State is very marked. This increase in 1882, over 1881, was more than \$16,250,000. The increase in 1883 over 1882 was \$19,535,488. The total taxable value in 1883 was \$306,784,891. The increase in railroad property was \$3,284,187.

The most notable increase in any section of the State is in the three most prominent truck-growing counties, Lowndes, Burke, and Thomas, their gain aggregating \$775,000.

The total recognized bonded debt of the State is \$9,445,500. The bonds bear interest at the rates as follow: \$6,547,500 bear interest at the rate of 7 per cent.; \$2,598,000 bear interest at the rate of 6 per cent.; and \$300,000 bear interest at the rate of 8 per cent.

The principal of the debt falls due as follows: 1886, \$4,000,000; 1889, \$2,298,000; 1890, \$2,098,000; 1892, \$307,500; 1896, \$342,000; 1884, \$100,000; 1885, \$100,000. Of the Nutting or 8 per cent. bonds but \$300,000 remain to be paid. Of this amount \$100,000 matures yearly—and the interest on the public debt is yearly diminished by the interest on \$100,000—\$8,000, to and including the year 1886, when the last of these bonds mature.

Agriculture.—In 1882 the State yielded, according to the estimates of its Department of Agriculture, the following leading products, with the following value:

Cotton, 941,868 bales, worth for the lint \$40,000,000, and for the 500,000 tons of seed \$4,000,000.

Oats, 11,643,482 bushels at 57 cents a bushel, worth \$6,682,000.

Wheat, 3,500,000 bushels at \$1.25, worth \$4,375,000.

Corn, 36,968,940 bushels at 66 cents, worth \$24,396,000.

During the truck-season of 1883, Georgia raised about 6,250,000 melons, of which there were sent to market all but 1,000,000, which were consumed on the farms, fed to stock, or wasted. This crop, supplemented by the vegetable crop, paid the farmers about \$250,000, which may be considered a surplus above the

staple crops. Much of the truck-land was used for cotton and corn, after the truck-crops.

State University.—The sum of \$50,000 offered to the State University by Senator Brown in 1882, upon certain conditions, which were not accepted by the Legislature (see "Annual Cyclopaedia" for 1882), was this year given by him to the institution, and accepted by it.

Oglethorpe Celebration.—On the 18th of February, the one hundred and fiftieth anniversary of the landing of the first colonists under Oglethorpe, the founding of the city of Savannah, and the birth of the State of Georgia, were celebrated in Savannah. Thousands of people from all sections of the country were present. Gov. Stephens delivered an address on Georgia's history, and a poem, written by Paul Hayne, was read by Gen. Jackson.

Education.—In all cities and counties there was paid, in 1882, as follows: To teachers of white schools, \$381,584.16; to teachers of colored schools, \$151,428.26; total, \$533,014.42. The poll-tax paid by white tax-payers in 1882 amounted to \$128,518, and that paid by colored tax-payers was \$59,405. The school-taxes obtained from rental of the Western and Atlantic road, from inspection of fertilizers, from shows, from liquor-dealers, from hire of convicts, etc., in all of which the negroes pay a large proportion, amount to \$125,953.36. There are 1,100 negroes and 100 white men in the penitentiary. Hence eleven twelfths of the hire of convicts comes out of the negroes. Fees for inspecting fertilizers are really paid by farmers, and the custom now is to make negro farm-laborers pay their part of the expenses of fertilizers. A recapitulation of what negroes contribute to the public-school fund stands: Poll-tax, \$59,405; proportion of taxes from other sources, \$65,722.70; total, \$125,127.70. Taking this aggregate from \$151,428.26, the amount paid to teachers of colored schools, there remains \$26,300.56 as the entire amount contributed by white tax-payers for the education of colored children. "This," says the commissioner, "was certainly no great burden to property-holders. The negroes returned property to the value of \$6,589,876. The State tax on this property amounted to \$19,769.62. Add this to \$125,127.70, the sum paid by them to the support of their schools, and we have \$144,897.32, nearly as much as their schools cost. It is thus shown that the white people, who really hold all the power of the State government, allowed the negroes for the support of their schools more than the whole amount paid by them for all purposes, and then took upon themselves all other expenses of government. The number of pupils in colored schools was 95,055, in white, 161,854. This gives a per capita for colored children of \$1.59, and for white, \$2.36."

GERMANY, an empire in Europe, formed by the union of the German states, consummated on May 4, 1871, when the Constitution of the German Empire replaced the articles of con-

federation between the North German states and the treaties by which the Grand Duchies of Baden and Hesse and the Kingdoms of Bavaria and Württemberg entered the League during the Franco-Prussian War. King Wilhelm I was proclaimed German Emperor from Versailles on the 18th of January, 1871, upon the successful termination of the war with France. He was born March 22, 1797, and ascended the Prussian throne on the death of his brother, Jan. 2, 1861. The heir-apparent, Friedrich Wilhelm, was born Oct. 18, 1831.

The sovereign powers of the confederation of states forming the empire are vested in the Prussian crown and the Federal Council, but the concurrence of the Parliament, or Reichstag, elected by universal suffrage, is necessary to the exercise of certain functions. The popular assembly possesses, also, certain rights of control over the acts of the Government. To declare war, if not merely defensive, the Emperor must have the consent of the Bundesrath, or Federal Council, in which body, conjointly with the Reichstag, or Diet of the Realm, are vested the legislative functions of the empire. The Bundesrath represents the individual states, and the Reichstag the German nation. The members of the Bundesrath, 62 in number, are appointed by the governments of the individual states for each session, while the members of the Reichstag, 397 in number, are elected by universal suffrage and by ballot, for the term of three years. The Bundesrath is presided over by the Chancellor of the Empire, who, as representative of the Bundesrath, has a right to interpose in the deliberations of the Reichstag. Both bodies meet annually, called together by the Emperor. All imperial laws must receive the votes of a majority in both houses. The assent of the Emperor, which must be countersigned by the Chancellor, is necessary to give them effect.

The Chancellor of the Empire, Prince Otto von Bismarck, fills the posts of President of the Council of Ministers, Minister of Foreign Affairs, and Prussian Minister of Commerce. In the office of Foreign Affairs his chief subordinate is Count von Hatzfeldt, Secretary of State, who is also Minister of State in Prussia. The Secretary of State for the Interior is Minister von Bötticher. The Chief of the Admiralty is Lieut.-Gen. von Capsivi, who succeeded Admiral von Stosch, on his retirement, March 8, 1883. The Secretary of State for Justice is Dr. von Schelling; Financial Secretary of State, Von Burchard; Chief of the Post-Office, Dr. Stephan; Minister of Railroads and Prussian Minister of Public Works, Dr. Maybach.

The Prussian ministry is composed as follows: President, Prince Bismarck, Minister of Foreign Affairs and of Commerce; Vice-President, Von Puttkamer, Minister of the Interior; Public Works, Maybach; Agriculture and Domains and Forests, Dr. Lucius; Justice, Dr.

Friedberg; Ecclesiastical Affairs and Public Education, Von Gossler; Finance, Von Scholtz; War, Lieut.-Gen. Bronsart von Schellendorff, who succeeded Gen. von Kameke, retired March 5, 1883; without portfolios, Von Böttcher and Count von Hatzfeldt.

Area and Population.—The area of Germany is 212,091 square miles. The total population of the empire returned in the census of Dec. 1, 1880, was 45,284,061, of whom 22,185,438 were males and 23,048,623 females. The number of foreigners was 275,856, of whom 117,574 were born in Austria-Hungary, 28,244 in Switzerland, 23,593 in Denmark, 17,898 in the Netherlands, 17,893 in France, 15,107 in Russia, 11,155 in Great Britain and Ireland, 10,826 in the United States.

The preliminary results of the enumeration of the population with reference to professions and employments, conducted June 5, 1882, were as follow, with the proportion of each class to the total in that year and in 1871, not taking account of the different method of classification:

DEPENDENT ON	Number.	Percent- age, 1882.	Percent- age, 1871.
Agriculture, stock-raising, and gardening.....	18,883,653	42·5	29·8
Forestry, hunting, and fishing.....	834,628		
Mining industry and works of construction.....	16,054,291	85·5	32·7
Commerce and transportation.....	4,529,780	10·0	8·9
Labor for hire and domestic service.....	988,148	2·1	17·2
Public service, ecclesiastical and liberal professions.....	2,228,184	4·9	5·5
Without profession or employment.....	2,245,257	5·0	5·9
Total.....	45,213,901	100·0	100·0

The population was divided, as to religious belief at the time of the census, as follows:

CREEDS.	Number.	Per cent.
Evangelical.....	23,313,592	52·6
Catholic.....	16,229,290	35·9
Other Christian.....	98,894	0·2
Jewish.....	561,612	1·2
Other.....	80,678	0·1
Total.....	45,284,061	100·0

There were 47,720 emigrants who renounced German nationality in 1881, against 28,780 in 1880. The number of foreigners naturalized in 1881 was 4,685. The number of emigrants in 1882, as compared with the number in 1881, and the countries of their destination, were as follow:

DESTINATION.	1882.	1881.
United States.....	189,878	206,189
Brazil.....	1,286	2,102
Other American countries.....	1,588	1,162
Australia.....	1,065	745
Africa.....	885	814
Asia.....	40	85
Total emigrants.....	198,687	210,547

The total emigration from 1820 to the end of 1882 was in the neighborhood of 4,000,000, of

which number about 8,250,000 emigrated to the United States.

The population of the cities with over 100,000 in 1880 was as follows:

CITIES.	Population.	CITIES.	Population.
Berlin.....	1,192,830	Frankfort-on-the-Main.....	186,819
Hamburg*.....	289,359	Hanover †.....	122,843
Breslau.....	272,912	Stuttgart.....	117,308
Munich.....	230,028	Bremen.....	112,428
Dresden.....	220,818	Dantzig.....	108,551
Leipzig.....	149,081	Strasburg.....	104,471
Cologne.....	144,773		
Königsberg.....	140,909		

Education.—Education is compulsory in all the German states. The elementary schools are supported by the communes. According to the returns of 1878, all recruits of the army could read and write, though in Bavaria and some other parts of South Germany there was a small percentage of them who were deficient in schooling.

In Freiburg, Munich, Münster, and Würzburg, Roman Catholic theology is taught, and in Bonn, Breslau, and Tübingen, both Catholic and Protestant; all the other universities are Protestant. There are, besides the students for degrees, non-matriculated students, who in Berlin numbered 1,219.

Commerce.—The values of the main classes of imports and exports in 1881 were as follow, in millions of marks and tenths of millions:

CLASSES.	Imports.	Exports.
Articles of consumption.....	1,046·2	592·2
Raw materials.....	984·6	540·5
Manufactured articles.....	514·2	1,526·6
Miscellaneous.....	466·9	315·3
Total.....	2,961·9	2,974·6

The imports of cereals were 372, exports 96 millions; imports of fermented liquors 43, exports 75½ millions; imports of live animals and animal products 330½, exports 186½ millions. The exports of manufactured products were nearly 90,000,000 marks more than in 1880. There was an increase in pottery and glass, metals, and metal manufactures, machines, leather manufactures, textiles and dress manufactures, and in all other articles except yarns.

The effects of the introduction of protective duties on the iron industry were investigated by the Iron and Steel Manufacturers' Association of Germany. In January, 1879, 825 private firms and joint-stock companies employed 158,979 hands, and paid in wages 9,383,396 marks monthly; in January, 1883, they gave employment to 206,150 laborers, an increase of 33·9 per cent., and paid in wages 14,754,350 marks monthly, an increase of 57·2 per cent. The net earnings of the 107 joint-stock companies were 5·16 per cent. in 1882, against 1·99 per cent. in 1879.

Navigation.—The movement of shipping in German ports in 1881 was as follows:

* Including suburbs, 410,127.
 † Including faubourgs, 164,697.
 ‡ With Linden, 145,227.

FLAG.	Tonnage entered.	Tonnage cleared.
German	8,679,568	8,788,566
Foreign	8,960,768	4,048,122
Total	7,688,881	7,774,688
Steam	5,145,116	5,211,389

The total number of vessels engaged in maritime commerce, and the number of steamships among them, which composed the German merchant marine on Jan. 1, 1882, with their aggregate tonnage and the number of men em-

ployed, as compared with the same date of the preceding year, were as follow :

YEAR.	Vessels.	Tonnage.	Crew.	Steamers.	Tonnage.	Crew.
1882.....	4,609	1,194,407	89,109	458	251,643	9,516
1881.....	4,660	1,151,525	89,660	414	215,753	8,657

Railroads.—The railroads in operation in the larger states, and the total mileage of the empire on May 10, 1883, were as follow, in kilometres :

STATES.	STATE LINES.		ADMINISTERED BY STATE.		ADMINISTERED BY COMPANIES.		Total.
	Principal.	Local.	Principal.	Local.	Principal.	Local.	
Prussia.....	18,118	1,969	2,188	361	8,184	885	21,005
Bavaria.....	8,869	420	578	51	4,918
Saxony.....	1,796	316	27	58	2,192
Württemberg.....	1,471	70	6	11	1,558
Alsace-Lorraine.....	1,103	167	...	5	...	4	1,379
Baden.....	1,111	111	57	48	1,827
Hesse.....	925
Other states.....	429	79	...	24	1,658	181	2,621
Total	38,192	3,189	2,273	491	5,401	1,032	85,500

Of the 80,795 kilometres of principal lines, 10,285 kilometres have double and 35 triple or quadruple tracks. Not included in the above are 1,252 kilometres of industrial railroads.

By the purchase of the Berlin and Hamburg, and Kiel and Altona, the Oder right-shore line, and the Upper Silesian railways, with some minor roads, the Prussian Government system of railways is completed. The aggregate length of the new acquisitions, authorized by a bill passed just before the close of the Landtag, is about 3,000 kilometres. By previous purchases the state owned 15,909 kilometres. It administered besides 2,236 kilometres of private roads. The principle of the government management of railroads was recognized in Prussia from the beginning. It was expressed in the railroad law of 1838, but the Government, before 1848, did nothing beyond extending financial support to the companies. In 1849 Minister von der Heydt carried a measure providing for the construction of a number of railroads by the Government. This policy was not carried out in the succeeding period, and in default of state construction every encouragement was given to the building of railroads by private enterprise. Hanover, Hesse, and Nassau, when annexed to Prussia, brought well-developed systems of state railways into the possession of the Government. After the French war the policy of state railroads was resumed, but the Central Government was unable to overcome the opposition of the middle states to a unified system of railroads under the control of the imperial authorities. The railroads in these states were mostly public property. Prussia immediately after the war constructed the Berlin-Wetzlar-Metz line, connecting the capital with the western part of the monarchy and the new imperial province, and pending the issue of the con-

trovery over the plan of an imperial system of railroads, began to acquire possession of the Prussian roads, standing ready to hand them over to the national Government, according to an enactment of June 4, 1876, whenever the empire would engage to purchase the remaining private lines. The political opposition to the scheme of a unified imperial system, which had withstood the raising of the tariff on freight and other coercive measures, and the efforts of the Imperial Railway Office, created by the Reichstag in 1873, was not weakened by this offer. Left to accomplish the work of nationalization alone, the Prussian Government made preparations to bring all the railroads in the monarchy under state management. It began the series of purchases in 1879, in which year the state net-work embraced 6,198 kilometres, besides 3,525 kilometres controlled by the state but owned by private persons. The task was completed by the purchase of the last six lines in 1883. The capital invested by the Government in its railroad net-work is 1,327,983,000 marks, raised by the issue of bonds to the amount of 1,867,339,885 marks.

The length of telegraph lines in 1882 was 74,312 kilometres; of wires, 265,058 kilometres. The number of dispatches was 18,862,173, of which 5,426,494 were foreign. The receipts of the postal and telegraphic service in 1882 were 164,259,372 marks; expenses, 140,733,520 marks. The Imperial Post-Office carried 681,976,350 letters, 168,929,480 post-cards, 14,018,710 patterns, 154,496,960 stamped wrappers, and 453,602,400 newspapers, in the year 1881. The number of post-offices at the end of 1881 was 11,088; telegraphic stations, 10,808; persons employed, 78,502.

Army and Navy.—The effective of the army on the peace footing in 1883 was as follows :

BRANCHES OF SERVICE.	Officers.	Men.	Horses.
Staff.....	2,089	4
Line.....	9,529	278,823
Jägers.....	424	11,120
Landwehr cadres.....	326	4,764
Cavalry.....	2,358	64,699	62,550
Field artillery.....	*1,501	84,517	16,191
Fortress artillery.....	729	16,849
Engineers.....	406	10,540
Train.....	200	4,905	2,457
Palace guards, etc.....	318	954
Total.....	18,118	427,374	81,598

The war effective, not including the Landsturm and special formations, was as follows:

DIVISIONS.	Officers.	Men.	Horses.	Gen.
Field army.....	19,891	744,081	242,415	2,040
Detot troops.....	4,796	396,614	31,373	444
Garrison troops.....	11,240	416,063	36,948	824
Total.....	35,927	1,456,677	312,731	2,908

The navy in 1888 comprised 7 iron-clad frigates, with 85 guns ranging from 12 to 26 tons, an aggregate displacement of 50,224 tons, engines of 43,100 horse-power, and armor of 10, 8½, and 5 inches thickness; 5 iron-clad corvettes, with 82 guns, 22 tons on all except one, 8 inches of armor, 25,400 horse-power, and 33,210 tons displacement; 27 cruisers, armed with 271 guns; 18 coast-guards, with 18 guns, besides 15 torpedo-boats; and 22 dispatch-boats, transports, and school-ships. There were under construction 1 iron-clad and 8 other corvettes, a gunboat on the Albatross system, and 2 armored gunboats.

The plans for a German navy were adopted in 1878, and the term of ten years was set for the completion of the new fleet. A new type of iron-clad corvettes was one of the first improvements carried out. This was the Sachsen class, intended for defending the coast and offensive action in German waters and the neighboring seas. They were designed to take the place of the previously adopted Hansa model, which was considered too weak for a battle-ship and too slow for a cruiser. The Sachsen corvettes are of shallow enough draught to run into the other North Sea ports as well as Kiel, and are exceedingly manageable and provided with rams and torpedoes. On this model were built the Sachsen, Baden, Bayern, and Württemberg. A reform which was taken up at about the same time was the substitution of iron-clad gunboats for the projected monitors, which in view of the development of torpedoes were deemed too uncontrollable and less valuable for local coast-defense than smaller vessels which could protect the lines of sunken torpedoes and move about in the shallow waters of the German coast, firing upon approaching iron-clads from a safe position, and, when these are obliged to move slowly and cautiously in difficult channels, even assuming the offensive, which their heavy guns enable them to do. Eleven of

these gunboats were finished and two in process of construction in the spring of 1888. The new cruisers of the first class were designed for a speed of 15 knots. Since wooden vessels were not firm enough to stand the agitation, they were made of iron and covered with copper to keep the bottom clean, which was separated from the iron hull, so that no galvanic action could take place, by two layers of teak. These vessels of the Leipsic class are armed with ringed cannon of from 12 to 17 centimetres caliber, and provided with tackling and equipments which would enable them to remain at sea for months. The cruisers of the second class, known as the Bismarck type, of which the Bismarck, the Blücher, the Moltke, the Stosch, the Gneisenau, and the Stein, are the representatives, are like the others in design and armament, but of smaller size and of a calculated speed of 18 knots an hour. Among the cruisers of the third class the four corvettes—Carola, Olga, Marie, and Sophie—form a separate class. They have a speed of 14 knots and carry 10 guns. Their chief purpose is to protect merchant-ships in distant waters and guard remote portions of the coast. The Whitehead fish-torpedo was adopted in 1876. It was at first intended to construct 28 torpedo-vessels; then it was proposed to fit out the regular war-ships with apparatus for firing torpedoes; and finally, for the better economy of these projectiles, costing about \$2,500 each, it was decided to employ also specially designed torpedo-boats. It was also expected that a flotilla of torpedo-boats would keep a hostile fleet at a distance and oblige it to keep under steam, and that it could dash into and cause damage and consternation to a blockading squadron. In 1881 the ships began to be armed with torpedoes or provided with the appliances for firing torpedoes either from the deck or under water. In a short time 64 vessels were thus equipped. The construction of torpedo-boats was begun at the same time. Eight were completed in 1883, and it was the intention of the Government to add to this number as rapidly as possible, to keep pace with other countries which are rapidly building torpedo-boats.

Finance.—The budget of the empire for the year 1883-'84, adopted March 2, 1883, calls for 537,297,805 marks for ordinary and 53,259,329 marks for extraordinary expenses.

The budget of 1884-'85 was voted July 2, 1883. It estimates the produce of customs duties at 196,450,000 marks; excise duty on sugar, 46,865,000 marks; on salt, 37,262,600 marks; on tobacco, 18,940,920 marks; on spirits, 35,925,900 marks; on malt, 15,791,000 marks; the net receipts of posts and telegraphs, 25,832,193 marks; of railroads, 16,690,600 marks; stamp duties, 19,436,680 marks; receipts of the invalid funds, 28,665,120 marks; surplus of the budget of 1882-'83, 15,825,000 marks; extraordinary receipts (from construction fund for fortifications, 10,400,000; for Parliament-house, 2,000,000; from loan for extraordinary pur-

* Number of batteries, 341; of guns, 1,374.

poses, 22,192,720 marks), 84,592,720 marks. leave The above and receipts from minor sources 83,702,768 marks to be provided by the matricular quota-shares of the states to make up the total budget of 590,819,344 marks, of which the appropriations were as follow :

EXPENDITURES.	Current.	Extraordinary.
Legislature	407,670
Chancery	126,970
Foreign affairs and consulates	6,825,415	80,000
Interior Department	2,371,788	2,173,975
Posts and telegraphs	2,695,725
Military administration	889,372,490	24,762,678
Naval administration	20,908,896	10,125,900
Administration of Justice	1,824,267
Treasury of the Empire	99,894,409	4,458,200
Office of Railroads	810,885
Debts of the Empire	15,927,500
Control	529,074
Railroad administration	250,000
Pensions	20,160,404
Invalid fund	28,662,190
Total, 1884-'85	544,827,866	46,431,478

The different loans authorized by the Reichstag, and the dates of the laws authorizing them, are as follow :

DATE.	Marks.
June 14, 1877	77,781,821
June 14, 1878	97,434,865
March 13, 1879	68,021,071
October 13, 1890	87,627,208
April 5 and December 12, 1891	64,912,885
February 15, 1892	29,674,405
July 2, 1893	16,192,720

Of the amount authorized prior to April 1, 1892, there had been issued at that date 819,239,000 marks. The amount of bank-notes of the empire in circulation at the same date was 153,164,210.

Receipt of the Emperor.—On April 14th the Reichstag, after having made no progress with the socialist laws, was stirred again by a rescript from the Emperor, less provocative, however, than that of the previous one. The aged monarch declared that he deemed it one of the first of his duties as Emperor to address his care and attention to the improvement of the condition of the laboring-class, and urged the Reichstag to grant a biennial budget, out of consideration for his declining years, in order that the autumn session might be devoted to the plans of social reform which he had at heart, and the hope be fulfilled before his death of the development and realization throughout the empire of the reforms begun by his father in the beginning of the century. The Emperor expressed the conviction that since the issue of the anti-socialist law, legislation should not be confined to police and penal measures, but should seek to remedy or alleviate the cause of evils combated in the penal code. Gratiified at the first success of his endeavors, in the remission of the two lowest grades of the class-tax in Prussia, he hoped to see the accident-insurance bill, presented in an amended form at the beginning of the session, with the supplementary project of sick-funds under corporate administration, embodied in laws before the separation of the Reichstag, and the atten-

tion of the Reichstag devoted in the ensuing winter session to a further proposal to provide for the maintenance of superannuated and invalidated laborers.

The stubborn determination of Prince Bismarck was as plainly indicated in the message as were the wishes of the Emperor. The Liberal majority gave vehement expression to their indignation, and referred the proposition to the budget committee, a form of indefinite postponement. Yet before they separated in June they voted the biennial budget, a procedure which they had repeatedly refused to follow, consoling themselves with the argument that the fiscal year was ended, and that it was therefore not a violation of the constitutional principle which they upheld.

Prince Bismarck's State Socialism.—After even the Progressists had ceased declaiming on theoretical grounds against the Chancellor's projects for the alleviation of the condition of the working-classes, and after the conciliatory overtures of the Government toward the Vatican, and the subsequent amendment of the Falk laws, had rendered the Ultramontanes, if not close allies, at least no longer obstructive opponents, Prince Bismarck was able to make better progress in his comprehensive scheme for the fiscal and social consolidation of the imperial power than at any time since the adoption of the protective policy and of the measures for the nationalization of the Prussian railroads. The aims which the Chancellor set before him in the organization of the finances of the empire involved the entire course of constitutional evolution. In following them he disrupted the great National-Liberal party which enabled him to unite Germany and thwarted the development of parliamentary government. Prussian officialism naturally prevailed over the more liberal systems of the smaller states, but to secure its acceptance by the thinking part of the population whose hopes were set on parliamentarism it was necessary to hold up the new ideal of socialism. The spread of the socialistic doctrines in two years by the help of the press has been remarkable. The measures proposed by Prince Bismarck all have an immediate practical object, and are supported on the ground of expediency by many who disapprove of their principle and tendency. The projects for the relief of the working-classes are expedient for the sake of enabling the people to sustain the burden of the military system, diminishing emigration, and counteracting the agitation of democratic and revolutionary socialism. The adoption of the system of indirect taxation accomplished the diverse objects of rendering the Imperial Government to a large extent independent of the matricular contributions of the states, of increasing the resources to meet the augmenting requirements of the military establishment, and, by allowing the states to share in the customs revenue, of enabling them to reduce burdensome direct taxes. The tobacco-monopoly scheme had the

same objects. This, like the bill empowering the Imperial Government to acquire all the German railroads, was rejected; the Reichstag objecting to them because they would greatly increase the patronage of the Government and its influence in elections; also, because these monopolies would place under the control of the executive the machinery for raising a large part of the revenue, and the power of increasing it at will; although its expenditure would still depend on the vote of the Reichstag, the effect would be to free the Government still more from parliamentary control. The Government would, moreover, by the control of the railway system, have power to favor or coerce individuals, towns, and districts. The command of the Prussian railroads already places it in the power of the central authorities to bring pressure on the other lines, and, as the Prussian budget makes an excellent showing for state management, there is a prospect of the eventual accomplishment of the railroad scheme. In the session of 1883 Prince Bismarck asked for an accession to the sources of revenue in the shape of timber-duties. It was opposed by the wood-working industries, and after an excited contest the bill was rejected, only by the temporary defection of the Polish deputies from the Center.

A favorite scheme of the German Chancellor for rendering the Government finances in a measure independent of the exigencies of party politics was to induce the Reichstag to vote the budget biennially. The Liberal Opposition has been weakened and divided by his parliamentary policy to such an extent that there was not the material in the present Reichstag to resist the Emperor's appeal. To escape the necessity of voting the budget for two years, and yet show becoming respect for the wishes of the Emperor, the deputies took up the sick and accident insurance bills. But in the end, by the aid of the Clericals, who were conciliated by the modification of the May laws, the supplies for two years were submissively granted. As soon as the budget was forced through, the Emperor closed the session, June 12th. It was the longest on record, having opened April 27, 1882.

The first fruit of the high tariff, in the way of relief for the poorer classes, was the abolition of the two lowest categories of the class-tax in Prussia. The Prussian Diet declined to grant Prince Bismarck's demand for an augmentation of the excise duties, which he declared necessary in default of the tobacco monopoly, and for the exemption of all incomes below \$300, but abolished the class-tax on incomes below \$215, whereas previously all households whose annual incomes exceeded \$100 were liable to the class-tax—that is, the tax on incomes between \$100 and \$750. Nearly 8,750,000 persons, or about one fifth of those subject to this tax, were relieved.*

* According to the returns of 1881, 80 per cent. of the population of Prussia had less than \$100 of annual income,

The accident and sickness insurance bill, in the form in which it was first laid before the Reichstag in the previous session, proposed that the Imperial Government should insure the work-people, and the employers and communes provide the premiums. The existing law of employers' liability required masters to provide the means for caring for employes injured in their service without fault of their own. It was ineffective, on account of the difficulty of proving that an accident is not due to a workman's own negligence. The insurance companies were accused of overcharging and defrauding the working-people. The bill was opposed by a large majority of the Reichstag, on the grounds that Government insurance would ruin the existing companies, that it would reduce the working-men to the condition of pensioners and destroy their independence, and that it would place great powers of coercion and interference in the hands of the agents of the Government. The bills were withdrawn and remodeled, and when again laid before the Reichstag in the session of 1882-'83, were freed of the feature of Government administration. The new bills proposed that insurance should be undertaken by the existing companies, trade-guilds, and communal institutions. It was proposed that the state should furnish part of the premiums. This share was to be one fourth, another fourth was to be assessed on the employers and presumably paid out of their profits, and the remaining one half was to be estopped from the wages of the workmen and likewise collected from the employers. Accident-insurance was made obligatory on all employed in mines, factories, and other industrial establishments, on railroads, and by steamship companies. In the case of an accident, the workman was to be a charge on the sick-insurance fund for the first three months, and then, if the disability continued, the charge would be transferred to the accident-insurance fund. There was bitter opposition to both bills. The clauses making insurance compulsory and laying part of the burden on the Imperial Government, were especially obnoxious to the believers in the traditional doctrines of political economy. The scruples of those who were alarmed at the socialistic features of the project were met by the argument that the bills form part of a series of projects which would take the place of all other pauper legislation. It was a matter of imperial concern to legislate for the extinction of pauperism, which is usually the result of sickness or accident. By helping to tide the workman over periods of incapacity, and enabling him to retain his position as a self-supporting member of society, the state would relieve the communes which have already to support the indigent and helpless by the poor-rates. In support of

nearly 66 per cent. belonged to households with incomes falling within the class-tax, and only 2½ per cent. had over \$750 income.

the clause compelling employers to provide a part of the premium, the preventive effect of such a provision was urged. It would impel employers, whose neglect is the frequent cause of accident and sickness, to employ precautions for the safety and health of their employes. The alternative proposal of voluntary insurance would fail altogether, because the working-people could not save the premiums out of their wages, and the employers would not voluntarily contribute. By the opponents of the bills it was argued that the effect of the state subsidy and assessment on the employers would simply be to reduce wages by so much. The fate of the measures depended on the course which the Center party would take. With them the objections against the accident insurance bill prevailed, and the subsidy provision was stricken out. The bill was consequently withdrawn, to be presented again in the following session. The sick-insurance bill received their support, and was carried by a majority rarely got together in the present divided and distracted state of the popular representation, showing the cogency of the various motives which actuate the different parties to approve legislation for the benefit of the "poor man." The vote was 216 to 99, the two Conservative fractions, the Center, the National-Liberals, the People's party, and eleven Secessionists, voting in the affirmative, and the Progressists, most of the members of the Liberal Union, and the Social-Democrats, in the negative. The Liberals accuse the Chancellor of venting his antipathy against the trading and manufacturing classes in his legislative programme, which imposes many new burdens on them, while it relieves the land-owning and farming classes of a part of their burdens. They made it a condition of their adherence to the sick-insurance project that its provisions should be extended to agricultural laborers. An amendment to this effect was added, but at the last hour it was rejected, and the bill passed in almost the original shape.

Cabinet Changes.—Surprise and a degree of dissatisfaction were felt at the removals, within a few days of each other, of the chiefs of the war and naval ministries, who had held their posts for ten years. The retirement of Gen. von Kameke was due to a difference between him and the Emperor. The Progressist deputies would only agree to an augmentation of military pensions on the condition that officers should be subject to direct taxation the same as civilians. The Minister of War was willing to accept the compromise, but the Emperor William insisted on perpetuating the invidious privilege. A disagreement with the Chancellor is said to have led to the resignation of Baron von Stosch. It was expected that the place would be filled this time by a naval officer, but the Emperor's predilection for the military profession had again to be gratified by the appointment of an infantry general to the direction of the navy.

Retirement of Parliamentary Leaders.—During the debates on the church bill Herr von Bennigsen, leader of the National-Liberal party from its foundation, discouraged by the manner in which Prince Bismarck treated him and his party after he lost their support and by differences with the remnant of the great party who still followed his lead, resigned his seats in the Reichstag and Prussian Landtag and retired from political life. Only a few months before, Eduard Lasker, the other great Liberal leader, had laid down his mandate and permanently retired.

Prussia and the Vatican.—Just before the close of the session the Prussian Minister of Worship, Von Gossler, introduced in the Landtag a bill relaxing the May laws, which embodied the concessions that the Government was willing to make for the relief of the spiritual deprivations of the Catholic population. The bill, which was passed by a majority of 224 Conservatives and Clericals to 107 Liberals and Free Conservatives, fell short of the demands of the Vatican, but in the minds of the Liberals imported nothing less than the penitential pilgrimage to Canossa. In the negotiations with the Curia since the re-establishment of diplomatic relations, the fundamentally different principles of the Prussian state and the Papacy could not be harmonized so as to afford the basis of an agreement, but a *modus vivendi* was equally desired on both sides. On Dec. 8d, 1882, the Pope wrote to the Emperor William, expressing his satisfaction at the reopening of diplomatic intercourse by the return of the Prussian legation to Rome. The Emperor's reply, sent December 22d, expressed the hope that such a conciliatory step would be met by concessions showing a like disposition on the Pope's part, and intimated that, if the Vatican would agree to notify the civil authorities of ecclesiastical appointments, the Government would feel encouraged to move in the matter of recasting the legislation which is necessary to protect the rights of the state which are assailed when it has to sustain a contest with the Church. The Pope replied, January 30th, offering a concession, viz., that the bishops should thenceforward be permitted to give notice to the Prussian Government of new appointments of cures, without waiting for the revision of the ecclesiastical laws, imposing, however, the condition that the revision should be extended to the laws which impede the exercise of ecclesiastical duties and the training of the clergy. The immediate object of the negotiations was to supply pastors to the numerous parishes which had long been bereft of all cure of souls, an evil and a scandal which the Government had stronger motives for remedying than the Pope. The points in controversy involved the three main provisions of the Falk laws, which formed the subject-matter of the three principal acts: 1. That the ecclesiastical dignitaries should advise the provincial authorities of all appointments to eccle-

siastical posts. 2. That disciplinary authority over priests should be exercised solely by Germans. 3. That education in a German school and university and a state examination were essential to qualify a person for the discharge of clerical functions. A note from Cardinal Jacobini to Herr von Schlözer, Prussian envoy to the Vatican, explained the position taken by the Curia. The Prussian Government in reply, May 5th, expressed willingness to agree to the appointment of vicars without notification, while requiring it for the priests who are appointed to a parish connected with a benefice, so that the Church would be enabled to provide for the reading of the mass and the administration of the sacraments independently of the Government, the only requirements being that the officiating priests should be native Germans who have received the legally prescribed education. The Government promised a revision of the May laws, and agreed to renounce the right to forbid the appointment of priests, but insisted that the Pontiff should first concede the right of notification, deeming it a point of honor that he should grant the right which is conceded to other governments. The only answer made to the demand of the Pope to have the education of young priests placed under the direction of the bishops was that the Government had already shown much compliance with regard to state examinations of candidates and the opening of priests' seminaries. The Vatican returned an unfavorable answer. The Government, instead of pursuing the negotiations in which it continually lost ground, seized the opportunity to execute one of the sudden strokes for which Prince Bismarck is famous, interrupting the negotiations by the proposal in the Diet of the new ecclesiastical law, and thus endeavoring to cover its retreat by an assumption of independence. The bill embodied larger concessions than were offered in the note of May 5th. The parishes of which the patronage was in the hands of the Government were already provided with priests under the laws of July 14, 1880, and May 31, 1882. The present act removed all responsibility from the Government for the lack of spiritual ministrations in the remaining parishes of which the bishops have the patronage. The bill consisted of six clauses:

The first and most important clause enacts that the bishops shall no longer be required to notify to the Government authorities the names of those candidates for the priestly office whose appointments can unconditionally be canceled, or who are only appointed as substitutes or delegates. The bishops will thus be enabled at once to provide the vacant parishes with chaplains, vicars, adjuncts, etc., without any previous notification to the Government. By clause 2, however, this concession is not to extend to the cases of those priests who are intrusted with the administration of parishes.

Clause 3 declares that the Ecclesiastical Court is no longer the highest tribunal of appeal for the clergy against the decisions of the Government authorities in matters regarding the appointment of candidates, the discipline in clerical seminaries, or episcopal rights in vacant dioceses.

Clause 4 provides that the Government authorities shall continue to be entitled to oppose the appointment of any candidate who shall appear to be unfit for an ecclesiastical office on account of his civil or political position, or whose education has not been completed according to the prescribed laws. The reasons for opposing the appointment of a candidate are always to be given, and the Church authorities will be allowed to appeal against this decision to the Minister of Public Worship, who represents the highest Court of Appeal.

Clause 5 enacts that the holy sacraments can be administered by missionary priests in all vacant parishes, as well as in those where the priests have been forbidden to conduct religious services, under the May laws.

And clause 6 repeals all former legislation which is contrary to the above five clauses.

The bill was passed with the exception of the fourth clause. The ecclesiastical courts which administered the veto power over ecclesiastical appointments had been the subject of continual reproaches from the Clericals. The transfer of its jurisdiction to the Ministry of Worship was not, however, looked upon in the light of a concession by the adherents of the Vatican, though satisfaction was expressed with regard to the main provisions of the act.

The Pork Question.—The prohibition of American pork products raised a subject of dissatisfaction and controversy between Germany and the United States. (See PORK, PROHIBITION OF AMERICAN.) In April the Chancellor chose to take offense at a dispatch from Minister Sargent to the Government at Washington, in which the motive for the interdict was stated to be, not fear of trichinosis, but the protection of German hog-growers. Reflections were made also on the lack of harmony between German public opinion and the Government. This confidential dispatch was reproduced from a New York paper in the "North-German Gazette," and the American minister was angrily attacked. An apology was afterward offered, with comments on the indiscretion of the American Government in publishing confidential dispatches.

Spanish Treaty.—In the latter part of August the members of the Reichstag were startled by a summons to an extraordinary session. When they assembled on August 29th, it was explained to be for the purpose of ratifying the treaty of commerce with Spain. The Emperor had signed it provisionally, expecting to ask from Parliament, when it met regularly, an act of indemnity for this divergence from constitutional forms. But organs of the press called in question the right of the Government to act as it had done, and the applicability of the principle of indemnity recognized in other states to the Imperial Constitution. The Progressists assailed the Government for the violation of the Constitution, but the majority simply approved the treaty and the fisheries convention, and the Reichstag was then prorogued. The treaty runs until June 30, 1887.

The most important concession made by Germany is the reduction of her dock dues from forty to ten marks, and of her customs duties on southern fruits, fresh grapes, olive-oil, choc-

raisins, etc. She has further promised raise her duties on wine, with one ex-rye, and other articles. Spain defines her duties on several articles of especially spirituous liquors and spirits, steel wire, and rails.

Copyright Treaty.—A copyright treaty between France and Germany was concluded April 19th. This convention replaces the former ones between France and single German states. An author obtains under this treaty all the rights of native authors, except as to the duration of the copyright, which must not exceed that accorded in his own country. Manuscripts, as well as published works, are protected. Publishers can obtain copyrights. The rights extend to musical compositions, works of art, etc., and can be secured by the heirs, assigns, and legal representatives of the author. Copyrighted literary productions can be drawn from in the preparation of school-books or of works of a scientific character. The restriction of the reproduction of articles from newspapers and periodicals to publications of the same class and the obligation to cite the source of a reproduction are not continued in the new treaty. According to French law, every use of a melody without the permission of the composer is illegal, but the German principle was retained in the treaty, which requires only that a composition should have distinguishing characteristics, though an unauthorized arrangement of an air is forbidden. Public presentations of musical or dramatic compositions without authority are made actionable. An author preserves the right of translation for ten years if he has a translation published in either country within three years, otherwise he can not restrain the publication of a translation in the other country. Authors of musical and dramatic productions also retain exclusive rights of translation for the same periods. No registration or other formality is required to secure authors' rights. The convention is binding on both governments for six years, and then remains in force until one year after a notice of repeal has been received from either party.

Relations with France.—The continuance of the Austro-German alliance, which was said to be in danger of breaking off, was confirmed by the annual meeting of the Emperors at Ischl, and by other convincing signs. The influence of Prince Bismarck was seen to prevail in Europe to an extent which excited the susceptibilities of the French. Not only was Italy's understanding with the allied empires admitted by the Italian Minister of the Exterior and the Hungarian Premier in public announcements, but the Spanish commercial treaty, the visit of King Alfonso to the Emperor, and the return visit of the Crown Prince, showed that Spain also had gravitated toward the league of peace. In September the German Chancellor, in the "North-German Gazette," the official organ, raised a warning cry against France as the disturbing influence in Europe. Like similar

notes of alarm on the same subject, one of which was uttered earlier in the year, immediately after Signor Mancini's announcement of the triple alliance in the Italian Parliament, the time was chosen when there seemed to be the least occasion for it. It had the appearance, therefore, of a menace, and did not fail to give offense to the sensitive French people. The appointment of King Alfonso to the honorary colonelcy of the regiment garrisoned in Strasburg excited the Parisians to the demonstrations at the station which Alfonso was subjected to on his return from Germany. The German press called upon the Government to take up the insult, but Prince Bismarck was careful not to provoke the French popular temper too far. The attendance of King Alfonso of Spain, and King Milan of Servia, besides the King of Saxony, the Crown Prince of Portugal, and the Prince of Wales, as the guests of the Emperor at the autumn manoeuvres, which began September 14th, was among the indications of the supreme influence of Bismarck and his peace policy in Europe.

Alsace-Lorraine.—The imperial province was agitated more than usual, in 1888, by the language question. The deputies in the Reichstag kept up their attitude of opposition. In August, the lieutenant-general, Marshal Manteuffel, called forth indignant protests by refusing permission to one of them, M. Antoine, to start a French journal in Metz. The order that discussions in municipal councils should be conducted in German was followed a few months after by an attempt to banish French from the schools. The four hours a week which were devoted to the teaching of French were reduced to two.

Inundations.—In November and December, 1882, the Rhine and its tributaries, the Main and the Moselle, rose above the highest flood-mark recorded in the century. Between Cologne and Coblenz the plains were entirely submerged, and many towns and villages inundated, among them the city of Coblenz. Below that place many houses crumbled down. The waters subsided about the middle of December, but a week or two later heavy rains fell and the waters rose to a higher point than before. The rise was so rapid as to cause a large loss of life. Nearly all the towns and villages on the lowlands of the Rhine valley were under water. In seven villages alone 400 buildings fell in. Near Carlsruhe a bridge fell, precipitating 20 persons into the river, and on the Baden state railroad a derailed train plunged into the water, drowning several passengers. A boat capsized and drowned 28 peasants who had just been rescued from their houses. In Mayence, soldiers were employed night and day in constructing protective embankments, and bridges for the escape of the citizens in case these gave way. A lake, five miles broad, formed between Wesel and Emmerich. In Frankenthal, 6,000 people were driven from their homes. The distress was

GERMAN NATIONAL MONUMENT ON THE NIEDERWALD.

pitiful, although aid flowed in with promptness and liberality from all parts of Germany. The Emperor subscribed \$150,000, and the Reichstag granted \$750,000. The German-Americans displayed even greater generosity than the sufferers' own fellow-countrymen. Their gifts of money drew forth from the German press and Government warm expressions of kindness and appreciation. Of about \$150,000 distributed nearly the whole was raised in America.

Minor Events.—Celebrations and festivals succeeded one another through the year. On September 28th the Emperor unveiled the national monument on the Niederwald, near Rudesheim, designed by Prof. Schilling, of Dresden, and erected in commemoration of the victories over the French in 1870-'71. A Hygienic Exhibition was held in Berlin in April, and in July an International Art Exhibition in Munich.

GORDON, Major-General Charles George, English traveler and soldier, was born in 1830, and is a younger son of Lieutenant-General H. E. Gordon. He entered the military service as Lieutenant of Engineers in 1852, and took part in the Crimean War, in which he was wounded before Sebastopol. At the conclusion of the war he was appointed on the commission intrusted with the delimitation of the boundary between Turkey and Russia in Asia. After serving in the expedition to China, he remained in that country, and toward the end of 1861 undertook an exploring expedition to the Chotow and Kalgan gates in the Great Wall across Shensi, passing through the hitherto unknown capital of that province, Tiaynen. On his return to Peking he was appointed by the Emperor in March, 1863, commander-in-chief of the army sent to put down the Taiping rebellion. Mainly through his efforts the rebellion was suppressed in two years. In the English army he was promoted to be lieutenant-colonel in 1864, and in December of the same year decorated with the order of the Bath. He was vice-consul in the delta of the Danube from 1871 to 1873. He then undertook an expedition to Central Africa under the auspices of the Viceroy of Egypt, who appointed him Military Governor of the Equatorial Provinces. He ascended the Nile in a steamboat to the Albert Nyanza, combated the slave-trade, and in April, 1875, annexed Darfour to the dominions of the Khedive. The Khedive bestowed on him the title of pasha. He returned to Cairo in 1876, and refused to undertake another expedition to the Soudan, on account of the insufficiency of the military force placed at his disposal, and

also of a disagreement with the Egyptian authorities. In 1877 he returned to the Upper Nile as Governor-General of the Soudan. He went around through all the provinces that year and succeeded in pacifying the natives in a measure by dismissing extortionate officials and striking the rebellious elements with fear by the rapidity of his movements and his energy of character. A formidable rebellion in Darfour was quickly subdued. A long and tedious war with Abyssinia was brought to an end; but his efforts to establish a permanent good understanding with that country were unavailing. He captured hundreds of slave-caravans, and

GENERAL CHARLES G. GORDON. (From pen-and ink drawing.)

cut off the source of the supply of slaves to a considerable extent; yet, through the lack of co-operation on the part of the Egyptian officials, he was unable to stop the traffic completely. In January, 1880, he retired from the governorship of the Soudan. He accepted the post of secretary to the Marquis of Ripon, Viceroy of India, but resigned upon reaching Bombay, in June of that year. He took command of the Royal Engineers in Mauritius in May, 1881, and retired from active service the same year, with the rank of major-general. The Cape Government, in March, 1882, commissioned him to settle the Basuto question. He had reached an understanding with the Basutos, when

the Cape ministry, disliking his conciliatory proposals, interfered to modify the terms, and General Gordon resigned in October, 1882. He was about to start for Central Africa, at the invitation of the King of the Belgians, to carry on and extend the work begun on the Congo by Stanley, when, after the destruction of the army of Hicks Pasha, the English and Egyptian Governments urged him to undertake a mission to the Soudan as plenipotentiary to conclude the transfer of the western provinces of the Soudan to the native rulers, and arrange a peace with the Mahdi and the revolted provinces, on the basis of the retirement of the Egyptian officials and military, and the abandonment of sovereign rights. In the winter of 1883-'84 he crossed the Nubian Desert without escort, and on his arrival at Khartoum issued a proclamation announcing the terms of peace, and promising that the institution of slavery would not be interfered with.

GORTCHAKOFF, Alexander Mikhailowitch, Prince, a Russian statesman, born July 16, 1798; died March 11, 1888. He came of a princely family, and was educated at the celebrated Lyceum of Tzarskoye-Selo. The famous poet, Pushkin, whose widow he subsequently married, was one of his fellow-pupils. Immediately after his graduation he became private secretary to Count Nesselrode, Minister of Foreign Affairs, and was present at the Congress of Laybach and that of Verona. In 1824 he was appointed secretary to the Russian legation in London; in 1830 *chargé d'affaires* at Florence; and in 1833 first secretary to the Russian legation in Vienna, where the illness and death of his chief left him as acting head. In 1841, as ambassador extraordinary at Stuttgart, he negotiated a marriage between the Crown Prince of Wurtemberg and the Princess Olga, sister of the Emperor Nicholas. This was a very considerable diplomatic triumph, and he was rewarded with the dignity of privy councillor. In 1850 he was appointed minister at the German Diet, where he became the friend of Bismarck, the Prussian representative, and where he was the center of all opposition to revolution.

Hitherto Russia had represented the policy of conservatism in Europe, and had been ready to crush the spirit of progress wherever it might appear. Though Gortchakoff was not in full accord with his master's ambitions, he was supposed to be more ductile than some of the older statesmen. Accordingly, in 1854, during the Crimean War, he succeeded Meyerdorff as ambassador in Vienna, discharged his difficult duties with skill and courage, and played an important part in the negotiations which preceded the Treaty of Paris. He ceded only positions which were irrevocably lost, such as the exclusive protectorate of the Danubian provinces and the oversight of the mouths of the Danube, and inspired his adversaries with a high idea of Russia's powers of resistance even in the face of defeat.

In 1856 he was chosen by the new Emperor, Alexander, to succeed Nesselrode as Minister of Foreign Affairs, and this post he held for more than twenty-five years. Heretofore the Russian foreign ministers had been little known at home, and were considered as mere clerks of the Emperor, but Gortchakoff was highly popular as the inveterate enemy of Austria. From this time his one object was the aggrandizement of Russia, and his policy non-interference in the affairs of other countries. In 1856 he issued a circular denouncing France and England if they attempted to interfere with the administration of government in the Two Sicilies. An expression in this circular has become historical: "Russia does not put—she meditates." For the most part she kept this attitude of meditation and recuperation many years. Gortchakoff rejoiced in the overthrow of his enemy, Austria, at Magenta and Solferino; and he acquiesced in French intervention in Syria in 1861 as a blow struck at Ottoman independence. A year later he energetically opposed any interference by France and England with the civil war in the United States. He was at that time engaged in repressing the Polish insurrection, and in replying haughtily to the notes addressed to him by the various European powers, remonstrating with him for his severities. He had been appointed vice-chancellor in 1862, and in 1863, to the delight of the Russian people, he became chancellor. Gortchakoff kept his attitude of absolute neutrality during the struggle of 1866 between Prussia and Austria; but in 1870, when Paris was besieged and Victor Emmanuel was entering Rome, he seized the opportunity to propose a revision of the treaty of 1856. In the London Conference that followed, he secured for Russia the right of having her war-ships in the Black sea—which was a great victory for Russian policy—and he was rewarded by the Emperor with the hereditary title of Serene Highness.

From this time until the Turko-Russian War, Gortchakoff was occupied in strengthening Russian influence in the East and bringing about an alliance between the Emperors of Russia, Germany, and Austria, and stood at the height of his power and influence. But after the Russian army crossed the Danube he was compelled to yield in importance to generals and engineers. When Europe refused to sanction the Treaty of San Stefano, Gortchakoff was discredited, as well as Gen. Ignatieff. At the Berlin Congress Schouvaloff played a more important part than he. He never forgave Bismarck and Beaconsfield for thwarting all his designs at this congress, and his resentment toward Bismarck led to a coldness between Berlin and St. Petersburg. He had ceased to be a prime factor in European or even Russian politics before Alexander II was assassinated, and long before he was superseded by M. de Giers as Minister for Foreign Affairs. He lived to a time when Russia could no longer play off

one state against another, and the theory of a balance of power became untenable; yet he could not adapt himself to a new policy. Russia came to need a great Minister of the Interior more than the most skillful of foreign diplomatists; but Gortchakoff had studied Europe more closely than his own country, took no interest in the problems of finance, of industry, or of Nihilism, and even bore no part whatever in the great revolution by which the serfs were freed.

He was a classical scholar, a master of the French language, and an enlightened patron of the arts. His diplomatic circulars were models of clear diction, ingenious argument, and a logic which always seemed to attain its object by putting his adversary in the wrong. He left two sons, Prince Michel and Prince Constantin, both of whom are in the diplomatic service.

GREAT BRITAIN AND IRELAND (UNITED KINGDOM OF), a constitutional monarchy of Western Europe. The supreme legislative power resides in Parliament, which must be convoked annually, as supplies are only voted, and the mutiny act renewed, from year to year. During the past three reigns little has remained of the royal authority but the forms. During the same period the hereditary senate of the Peers has been driven to relinquish practically its share of the legislative authority, while the basis of representation in the House of Commons, or elective assembly, has been extended. By the Reform Bill of 1867-'68 the franchise was conferred upon all rate-payers and occupants of real estate of £10 annual value in the towns and cities, and £12 in the country. The executive authority and the initiative in legislation are, practically, concentrated in the hands of the Prime Minister, who is appointed as the leader of the dominant party, and who selects his associates to preside over the departments and to prepare with him the schemes of legislation to be brought forward in Parliament. Prorogation is the legal death of Parliament; and legislation which is not finally enacted at the close therefore goes for naught. There are no constitutional limits to the power of Parliament. Victoria I, Queen of Great Britain and Ireland, and Empress of India, was born May 24, 1819, and succeeded her uncle, William IV, June 20, 1837. The heir-apparent is Albert Edward, born in 1841. The present House of Commons first met in April, 1880. It is the twenty-second since the union, and the tenth of the reign of Victoria. Unless previously dissolved it will last until 1887. The House of Commons consists of 652 members. In 1882 writs were suspended in thirteen constituencies, so that the number of representatives was 639. At the beginning of the term the House was divided as to parties between 203 Conservatives and 286 Liberals from England, 8 Conservatives and 53 liberals from Scotland, and 24 Conservatives, 19 Liberals, and 60 Home-Rulers from Ireland; together,

235 Conservatives, 357 Liberals, and 60 Home-Rulers.

The House of Lords is composed of the hereditary nobles of England, new English peers created by royal patent, the English bishops who are peers *ex officio*, 28 Irish peers elected for life, and 16 Scottish representative peers elected for each succeeding Parliament. No new peerage can be created in Scotland, and in Ireland none until three existing peerages have become extinct; but in England peerages can be created for life or in perpetuity in any number. The House of Peers consisted in 1882 of 516 members, of whom 5 were peers of the blood royal, 2 archbishops, 22 dukes, 19 marquesses, 117 earls, 26 viscounts, 24 bishops, 257 barons, 16 Scottish representative peers, and 28 Irish representative peers. Only 87 of the peerages are older than the seventeenth century, and 315 are not older than the present century, no fewer than 166 having been created during the reign of Queen Victoria.

The Government.—The Prime Minister, W. E. Gladstone, on forming his ministry in 1880, took the office of Chancellor of the Exchequer in addition to his regular duties as First Lord of the Treasury. After the close of the extra session in the autumn of 1882, the Cabinet was reconstituted. Lord Derby entered the Cabinet as Secretary for the Colonies, Lord Kimberley taking Lord Hartington's place in the India Office, and the latter Mr. Childers's place as Secretary of War, while Childers received the Chancellorship of the Exchequer, relinquished by Gladstone. Sir Charles Dilke obtained a seat in the Cabinet as President of the Local Government Board, Mr. Dodson becoming Chancellor of the Duchy of Lancaster. The Cabinet consisted in 1883 of the following fourteen members:

William Ewart Gladstone, First Lord of the Treasury; Lord Selborne, Lord High Chancellor; Earl Spencer, Lord President of the Council; Baron Carlingford, Lord Privy Seal; Hugh C. E. Childers, Chancellor of the Exchequer; Sir William Harcourt, Secretary of State for the Home Department; Earl Granville, Secretary of State for Foreign Affairs; the Earl of Derby, Secretary of State for the Colonies; Earl Kimberley, Secretary of State for India; the Marquis of Hartington, Secretary of State for War; Lord Northbrook, First Lord of the Admiralty; Joseph G. Dodson, Chancellor of the Duchy of Lancaster; Joseph Chamberlain, President of the Board of Trade; Sir Charles W. Dilke, President of the Local Government Board.

The Lord Lieutenant of Ireland is Earl Spencer, who succeeded Earl Cowper May 8, 1882. The Secretary of State for Ireland is G. O. Trevelyan, who has not a seat in the Cabinet, as the Viceroy holds a Cabinet office.

The Committee of the Privy Council for Education has Anthony J. Mundella for vice-president. A new department of the Govern-

ment, the Committee of the Privy Council for Agriculture, was created in 1883, with the Chancellor of the Duchy of Lancaster for its first vice-president.

Area and Population.—The total area of the British Empire is 7,774,657 square miles; the population, according to the census of 1881, 249,259,832. The area of the British Islands is 121,483 square miles, and the population, as returned by the census of April 4, 1881, is 35,172,976, distributed as follows:

UNITED KINGDOM.	Square kilometres.	Males.	Females.	Total population.
England	121,638	11,961,842	12,652,084	24,613,926
Wales	19,069	678,060	683,458	1,361,518
Scotland	78,895	1,797,565	1,936,805	3,734,370
Ireland	84,338	2,082,377	2,641,559	4,723,936
Isle of Man	538	26,291	27,798	54,089
Channel Islands	196	40,321	47,381	87,702
Soldiers and sailors abroad	147,540	147,540
Total	314,628	17,184,896	17,988,080	35,172,976

The increase in England and Wales between 1871 and 1881 was 14·86 per cent., which was higher than in any decennium since 1831-'41; the increase in fifty years was 86·9 per cent.

The natural movement of population in the three kingdoms in 1882 was as follows:

UNITED KINGDOM.	Marriages.	Births.	Deaths.	Excess of births.
England	208,907	888,940	518,788	370,152
Scotland	26,574	126,183	73,266	52,917
Ireland	22,058	122,715	83,787	38,928

The natural increment of the population of England is about 1·45 per cent. per annum.

The total number of males returned by the census of 1881 as engaged in some definite occupation was 7,788,646, or 71·5 per cent. of all aged five years and upward; of females, 3,403,918, or 29·4 per cent. The civil service employed 50,245 persons, and the police 32,508. The number of soldiers in England and Wales at the date of the census (including yeomanry and militia) was 87,168, and of men in the Royal Navy (excluding 8,910 pensioners) 20,732. The number in the clerical profession was 85,823, including nearly 24,000 clergy of the Established Church; in the legal profession, 17,886; the medical profession, 22,936; engaged in educational work, 72 per cent., of whom were women, 171,831; actors and actresses, 4,565. The number of photographers increased from 4,715 in 1871 to 6,661 in 1881.

The population of Ireland was divided in respect to religion, according to the census of 1881, as follows: Roman Catholics, 3,960,891; Anglicans, 639,574; Presbyterians, 470,734; Methodists, 48,839; other denominations, 54,268; not determined, 530. The number of adherents to the different creeds in England was estimated in 1871 as follows: Anglicans, 17,781,000; Dissenters, 8,971,000; Roman Catholics, 1,058,000; Israelites, 89,000. In Scotland: Church of Scotland, 1,473,000; Dis-

senters, 1,486,000; Catholics, 320,000; Church of England, 73,200.

The total emigration from Great Britain and Ireland, from 1815 to 1882, amounted to 10,047,885 persons, of whom 6,608,035 went to the United States, 1,712,020 to British North America, 1,364,226 to Australia and New Zealand, and 368,554 to other countries. The emigration in 1882 from British ports was divided, in respect to origin and destination, as follows:

EMIGRANTS.	United States.	Canada.	Australia.	Other countries.	Total.
English	94,599	27,768	24,945	16,285	163,597
Scotch	19,004	4,630	6,240	2,868	32,742
Irish	63,800	8,048	6,704	1,080	84,132
Foreigners	112,709	18,064	1,807	2,979	180,559
Unknown	927	8	2,258	3,293
Total	295,539	58,475	38,604	25,670	418,288

The immigration into the United Kingdom was 78,268 in 1882, 77,105 in 1881, 68,816 in 1880, and 53,973 in 1879.

The emigration from Ireland from 1856 to 1860 was at the average rate of about 100,000 persons a year; in the next five years, from 1860 to 1865, about 140,000 annually; from 1866 to 1870 about 180,000; from 1870 to 1875 about 70,000. In the year 1880 the number was about 98,000; in 1881 about 100,000. Nearly all the emigrants were furnished the means for the voyage to the United States or other points of destination by friends who had preceded them. In all, about £1,500,000 was remitted to Ireland in this way. This emigration did not proceed from the congested districts in the west of Ireland as much as from some other parts of the country.

The population of British cities of over 100,000 inhabitants was returned in 1881 as follows:

CITIES.	Population.	CITIES.	Population.
London*	2,314,571	Hull	154,240
Liverpool	532,508	Stoke-upon-Trent	152,894
Glasgow	511,539	† Newcastle	145,659
Birmingham	400,774	‡ Gateshead	63,506
§ Manchester	341,414		
¶ Salford	176,295	West Ham	128,692
Leeds	308,119	Portsmouth	127,929
Sheffield	284,508	Lancaster	122,876
Dublin	249,602	Sunderland	116,512
§ Edinburgh	223,190	Oldham	111,843
Leith	81,168	Brighton	107,546
Belfast	208,129	Bolton	105,414
Bristol	204,874	Aberdeen	103,054
Nottingham	186,575	Blackburn	104,014
Bradford	138,083		

The number of municipal boroughs in England and Wales in 1881 was 243, with an aggregate population of 8,412,121, or 32·4 per cent. of the total population of the kingdom. The population of London increased in the decade 1871-'81 17·3 per cent.; that of nineteen other large towns 16·5 per cent.

Postal Savings-Banks.—The deposits in the

* The Metropolitan District. The Police District contains 4,764,312 inhabitants.

† The Metropolitan Police District contains 849,648 inhabitants.

‡ The towns of West Ham, Croydon, and Tottenham form part of the London Police District.

Post-Office savings-banks on Dec. 31, 1882, amounted to £39,087,821, an increase of £2,-843,326 over the amount of the previous year. In the Irish banks there was an increase of £90,508, which was more than the average increase of ten years. The number of depositors in the postal-banks was 2,858,976.

Education.—The act of 1870 provided that there shall be established in every school district public elementary schools with sufficient accommodation for all children whose education is not otherwise provided for. Children whose parents are unable to pay the school-fees have their expenses defrayed from the local rates. The public schools are under the supervision of district school boards, who, with their other powers, have authority to compel parents to provide for the education of their children between the ages of five and thirteen. The percentage of persons who were unable to sign their names to the marriage register in the five years from 1875 to 1880 was 14·8 among the men and 20 among the women. In 1879 14 per cent. of the men and 20 of the women married signed with marks in England, 9 per cent. of the men and 18 of the women in Scotland, and 31 per cent. of the men and 88 of the women in Ireland. The parliamentary grants to primary schools amounted to only £40,000 in 1840. Since the school act they have been increased from £914,721 in 1870 to £2,749,868 in 1882 and £2,938,980 in 1883. The number of schools inspected in Great Britain was 13,-954 in 1873 and 21,186 in 1881. The average attendance increased from 1,783,780 to 3,273,-501. In the vote for public education in 1883 allowance was made for 3,245,046 children.

Pauperism and Crime.—The number of paupers, exclusive of vagrants and casual poor, relieved in the poor-law unions and parishes of England and Wales in 1882 was 797,614, against 808,126 in 1881, 837,940 in 1880, 800,426 in 1879, 815,-587 in 1875, and 1,079,391 in 1870. The number of able-bodied adult paupers included in the above was 106,280 in 1882, 111,169 in 1881, and 126,228 in 1880. The number of registered paupers and their dependents in Scotland in 1881 was 97,787, against 98,608 in 1880. The number of in-door and out-door paupers in Ireland, and the total, including others in asylums, was, for the five years, 1878-'82, as follows:

YEAR.	In-door.	Out-door.	Total.
1878	49,365	85,500	84,865
1879	51,764	89,385	91,099
1880	57,455	42,735	100,190
1881	55,804	58,658	109,665
1882	58,781	58,258	112,839

The number of criminal offenders convicted in 1881 was 11,858 in England and Wales, 1,832 in Scotland, and 2,698 in Ireland. In England and in Scotland there was a considerable decrease in ten years. In Ireland the number remained almost stationary. The substitution for penal colonies of a system of convict prisons, which has been gradually improved un-

der the efforts of scientific prison reformers, has been attended with a gradual diminution of crime. In the ten or fifteen years previous to 1872 the practice of deporting convicts was gradually abandoned in obedience to the wishes of the colonists, who preferred a scarcity of labor to having it supplied by the criminal outcasts of the mother-country. In the five years ending in 1874 the number of sentences to penal servitude in England and Wales averaged 1,622 per annum; in the five years ending in 1879 it was 1,633; in the year 1881 the number was 1,525. As compared with the five years ending 1859, when the population was 20 per cent. less, the convictions in 1881 showed a decrease of almost one half. The number of convictions for short terms showed a corresponding improvement, being 9,266 in 1881, against an average of 9,848 in the five years ending in 1874, and of 12,058 in the five years ending in 1869. The average length of the terms to which convicts were sentenced has increased, and the population of the prisons has remained almost stationary, being 10,221 on March 31, 1882, against 10,160 at the end of 1871. Under the British prison system the convict is kept in solitary confinement, but at hard labor, during the first nine months of his imprisonment. During a second period he sleeps and eats in his cell, but works in company with his fellow-prisoners. At the end of this period, which is of variable duration, he is conditionally released on ticket-of-leave, under police supervision. The dread of the term of isolation, of the spare diet and the severe labor, has a greater deterrent effect than the prison discipline had in the times when it was less inflexible. The system of marks enables a prisoner to shorten his term of imprisonment by one fourth, and to earn money to be paid on his release. The illiterate are taught reading and writing, and trades are taught to those who have none. Of 9,107 prisoners in custody on July 1, 1882, 8,235 learned their trades in prison. The estimated value of convict-labor, exclusive of the portion utilized in the service of the prison, was, for the year ending with March, 1882, £217,274. There are a number of Prisoners' Aid Societies which encourage discharged convicts to lead honest lives. Of 1,582 male prisoners liberated in the year ending March 31, 1882, 954 were assisted by these benevolent societies; of 249 female prisoners, 84 received aid of this kind, and 144 were received in refuges. An important reform in prison management is the separation of prisoners hardened in crime from the rest. This was adopted in 1877-'78, and two years later the idea was further developed by the separation of novices in crime from the body of the prisoners. Cruelty on the part of jailers is not likely to occur, but the persecution of ex-convicts by the police under the system of surveillance has sometimes been complained of.

Commerce.—The total values of imports and exports in 1882 and the six preceding years

were, in thousands of pounds sterling, as follows:

YEAR.	Total imports.	Domestic exports.	Foreign exports.	Total exports.	Total commerce.
1882	418,020	241,467	65,198	306,665	719,685
1881	397,023	284,023	63,060	297,063	694,106
1880	411,280	223,060	63,254	286,414	697,644
1879	362,992	191,582	57,252	248,788	611,776
1878	363,771	192,849	52,625	245,484	614,255
1877	394,420	193,898	53,458	252,346	646,766
1876	375,155	200,689	56,187	256,776	631,931

The declared values of specie and bullion imported and exported in 1882 and the three preceding years were as follow, in thousands of pounds:

YEAR.	GOLD.		SILVER.		TOTAL.	
	Import.	Export.	Import.	Export.	Import.	Export.
1882..	14,876	12,024	9,243	8,965	23,619	20,989
1881..	9,963	15,499	6,901	7,004	16,864	22,508
1880..	9,455	11,829	6,799	7,061	16,254	18,890
1879..	18,869	17,579	10,737	11,006	24,156	28,585

The import and export commerce with the principal commercial nations in 1882, as compared with 1881, was as follows, in thousands of pounds:

COUNTRIES.	IMPORTS.		EXPORTS.	
	1881.	1882.	1881.	1882.
United States	108,208	83,353	29,796	30,970
India	32,629	39,921	29,244	39,059
France	39,934	39,090	16,970	17,421
Australia and New Zealand	26,975	25,175	21,378	25,365
Germany	23,650	21,571	17,481	18,518
Netherlands	23,028	25,331	6,900	9,820
Russia	14,059	21,043	6,166	5,773
Belgium	11,510	14,988	7,075	8,050
British North America	11,301	10,399	8,411	9,700
Sweden and Norway	10,054	11,759	3,361	3,693
China	10,704	9,936	5,965	4,613
Spain	10,023	11,458	3,856	3,670
British South Africa	5,418	6,275	7,073	7,496
Brazil	6,340	6,499	6,656	6,376
Turkey	4,170	4,332	6,679	6,423
Egypt	9,313	7,796	8,168	2,451
Italy	3,275	3,481	6,681	6,450

The import commerce with Europe and the Levant amounted, in 1882, to £183,306,000, against £163,552,000 in 1881; the export commerce to £38,834,000, against £37,621,000; import commerce with countries of North and South America in 1882, £108,707,000; in 1881, £120,962,000; exports in 1882 to American countries, £54,528,000; in 1881, £51,740,000; imports from all other foreign countries in 1882, £21,576,000; in 1881, £20,969,000; exports in 1882, £13,280,000; in 1881, £15,297,000; total imports from foreign countries in 1882, £313,589,000; in 1881, £305,438,000; total exports to foreign countries in 1882, £156,642,000; in 1881, £154,658,000; imports from British possessions in 1882, £99,481,000; in 1881, £91,539,000; exports to British possessions in 1882, £34,825,000; in 1881, £79,365,000.

The values imported and exported of the general classes of merchandise in 1882 were as follows:

CLASSES OF MERCHANDISE.	Imports.	Exports.
Articles of consumption	£183,460,000	£29,725,000
Raw materials	182,183,000	48,177,000
Manufactured articles	28,738,000	162,262,000
Miscellaneous	68,664,000	30,708,000
Total merchandise	£418,020,000	£241,467,000

The imports of cereals were £37,884,000; of fermented drinks, £8,066,000; exports, £2,685,000; of colonial produce, £43,034,000; of tobacco, £2,551,000; of animals and animal food-products, £44,155,000; of textile materials £85,199,000; of timber, etc., £18,042,000; of hides, etc., £14,154,000; exports of coal, £9,565,000; of metals, £35,484,000; imports, £12,278,000; of textile fabrics and dress manufactures, £102,786,000; imports, £13,365,000; of yarns, £18,410,000; imports, £3,811,000; of leather manufactures, etc., £3,488,000; imports, £1,928,000; of vessels, machinery, locomotives, etc., £18,621,000; of other metal manufactures, £7,268,000; imports, £2,642,000; of glass and pottery, £3,395,000; imports, £1,679,000; of paper manufactures, £1,305,000; of wood and straw manufactures, £1,419,000; of books, etc., £1,170,000; imports of works of art, £501,000; imports of drugs, dyes, and chemicals, £6,636,000; exports, £6,603,000; imports of resins, fats, and oils, £13,222,000; of fertilizers and waste products, £1,848,000.

The quantity of wheat imported from the United States in 1882 was 8,180,578 quarters; from Russia, 3,233,238; from India, 1,978,078; from Germany, 719,581; from Canada, 626,460; from Australasia, 577,530; from Chili, 386,484; from Turkey, 123,336; from Roumania, 45,404; from Egypt, 40,801; from other countries, 47,124; total, including flour, 16,860,084 quarters of 480 pounds, value £44,869,032. The large supplies which unexpectedly arrived from Russia and India had the effect of keeping down the prices, and of forcing the hands of the holders of grain in the United States.

The aggregate tonnage of sailing-vessels, with cargoes, engaged in foreign trade, which was entered at British ports in 1882, was 17,810,380 under the British, and 7,004,669 under foreign flags; total, 24,815,049, against 23,224,708 in 1881, and 10,054,981 in 1860; tonnage cleared, 20,392,626 British and 7,306,237 foreign; total, 27,698,863; steam tonnage entered, 17,477,111 British and 3,854,333 foreign; total, 21,331,444, against 19,268,327 in 1881, and 2,549,000 in 1860; steam tonnage cleared, 17,926,004 British and 3,987,910 foreign; total, 21,914,814; total tonnage entered, 30,318,938; cleared, 31,172,317. The aggregate tonnage of coasting-vessels entered in 1882, not including repeated voyages, was 41,535,274; cleared, 35,353,775.

The following table exhibits the number of vessels constituting the merchant marine of Great Britain and the aggregate number composing the merchant fleets of the colonies, with their registered tonnage in thousands of tons in 1881 and 1882:

MERCHANT MARINE.	SAILING-VESSELS.		STREAMERS.		TOTAL.	
	Number.	Tonnage.	Number.	Tonnage.	Number.	Tonnage.
United Kingdom... 1881.	18,780	3,640	5,492	3,001	24,272	6,641
1882.	19,263	3,577	5,795	3,382	24,168	6,909
Colonies... 1881.	12,735	1,696	1,745	288	14,480	1,934
1882.	12,818	1,649	1,820	289	14,638	1,838

The number and tonnage, in thousands of tons, of vessels employed in the home trade, i. e., between ports of the United Kingdom and on the coast of the British Channel and the North Sea from Brest to the mouth of the Elbe, partly in the home and partly in the foreign trade, and in the foreign trade of 1882, were as follow :

ENGAGED IN	SAILING-VESSELS.		STREAMERS.		TOTAL.	
	Number.	Tonnage.	Number.	Tonnage.	Number.	Tonnage.
Home trade.....	10,048	656	1,482	254	11,480	910
Home and foreign.....	824	116	828	151	1,141	267
Foreign trade....	8,718	2,663	2,626	2,885	6,889	5,588
Total.....	14,588	3,425	4,881	3,290	18,966	6,715

Railroads, Posts, and Telegraphs.—The number of miles of railroads in operation in 1882, their aggregate cost of construction, and the gross and net receipts, compared with the totals for the United Kingdom in 1881, were as follow :

UNITED KINGDOM.	Miles.	Cost of construction.	Gross receipts.	Net receipts.
England and Wales.....	18,000	2,635,186,000	259,106,000	228,178,000
Scotland.....	2,940	87,750,000	7,473,000	3,773,000
Ireland.....	2,466	84,908,000	2,811,000	1,268,000
Total 1882.	18,405	2,767,899,000	269,390,000	233,219,000
Total 1881.	18,176	745,523,000	67,153,000	82,250,000

A considerable proportion of the street railroads laid down in recent years have been constructed by the municipal authorities under the tramway act of 1870, which gives local governments provisional authority to build, own, and control tramways. Of a total length of 564 miles in operation in the United Kingdom in June, 1882, 150 miles were the property of municipalities. This plan of building them at the expense of the municipal corporations insures a system of urban communication better adapted to the wants of the public than private companies would supply, besides preventing the monopoly of the streets for the profit of individuals. The roads thus constructed are usually leased under stringent contracts to private persons.

The number of post-offices in the United Kingdom in 1882-'83 was 15,406; persons employed, 44,600, including 2,500 females. The number of letters carried by the post in 1882-'83 was 1,078,000,000 in England and Wales, 117,000,000 in Scotland, and 86,000,000 in Ireland—total, 1,281,000,000; total postal-cards, 144,000,000; newspapers, etc., 429,000,000; post-office orders, 16,200,000; total value,

£26,995,000. The receipts of the post-office in the year 1880-'81 were £6,738,427; expenses, £4,185,659. The number of letters per head of the population in the United Kingdom was 36, as compared with 21 in the United States, 15 in France, 13 in Germany, 6 in Italy, and 5 in Spain.

The telegraphs were transferred to the state in 1870. The length of the lines in 1882 was 26,465 miles; of wires, 121,720 miles. The number of dispatches sent was in England and Wales 26,928,722; in Scotland, 3,244,202; in Ireland, 1,919,102; total, 32,092,026. The number of offices in 1881 was 5,448. The receipts for the year 1880-'81 amounted to £1,693,884; expenses, £1,805,006. A resolution was carried against the Government in the House of Commons calling for a reduction in the rate for messages of twenty words or less from 1s. to 6d. The Government in its financial plans made arrangements for the speedy introduction of this reform, which has been discussed for fifteen years.

Colonies.—The British colonial possessions, covering about one seventh of the land-surface of the earth, are grouped into forty administrative divisions, some of them embracing a number of formerly separate colonies. Those containing a large and preponderant European population have all been endowed with self-government, the home Government retaining merely a veto on legislation, which is exercised only in matters of imperial concern. They possess representative institutions, modeled after the English Constitution, designated responsible government. The crown appoints the chief executive officer, called the Governor-General in Canada and the Governor in Newfoundland, Cape Colony, and the Australian colonies. Western Australia, Natal, Ceylon, and the Bahama, Bermuda, Windward, and Leeward islands, are governed by representative bodies, subject only to the veto right of the crown, but all the administrative officers are appointed and controlled by the home Government. The remaining possessions have neither responsible nor representative government, but are governed absolutely by the English Government and its representatives. Of this class is the Empire of India; ruled by a Governor-General under directions from the British Government, which has a special ministry for Indian Affairs. The affairs of the colonies are regulated by another department, the Colonial Office. The crown colonies are Gibraltar, Heligoland, Malta, Falkland islands, Guiana, Trinidad, Ascension, Mauritius, St. Helena, Sierra Leone, Aden and Perim, Cyprus, Hong-Kong, Labuan, Straits Settlements, Feejee islands, and Rotumah, in which the executive head is called a Governor; Jamaica, with Turks islands, where he is designated Captain-General; and Gambia, the Gold Coast, and Lagos, in which the delegate of the crown authority is termed Administrator. The annual cost of the colonies to the British Government

is something over £2,000,000, chiefly for military and naval expenses, and mainly disbursed in the nine military and naval stations of Gibraltar, Malta, Cape Colony and Natal, Mauritius, Bermuda, St. Helena, Cyprus, and Hong-Kong.

The following table gives the area and population of the colonies, dependencies, and military and naval stations composing the British colonial empire, with the statistics of commerce and finance in 1881 of most of the colonies:

POSSESSIONS.	Area, sq. miles.	Population.	THOUSANDS OF POUNDS STERLING.					Navigation, thousands of tons.
			Revenue.	Disbursements.	Debt.	Imports.	Exports.

* Not including the Kuris Muris islands, Moeha, Kamarin, and Koeling islands, the total area of which is less than one hundred square miles.

† Not including the Chatham islands, Norfolk island, and the islands of Auckland, Lord Howe, Caroline, Starbuck, Malden, and Fanning. The natives of Australia, estimated at 55,000, and the Maoris of New Zealand, numbering 44,000, are not included.

‡ Not including Whale Bay, Tristan da Cunha, New Amsterdam, and St. Paul.

The railroad mileage in operation in British colonies at the beginning of 1882 was as follows:

COLONIES.	Miles.
British India.....	9,875
Canada.....	7,260
Australia, etc.....	5,426
Cape Colony.....	959
Ceylon.....	178
Natal.....	984
Mauritius.....	82

COLONIES.	Miles.
Trinidad.....	322
Jamaica.....	25
Guiana.....	21
Total.....	22,962

The telegraph lines of India, Ceylon, Australasia, and Cape Colony, had an aggregate length of 58,156 miles.

The Army.—The army estimates for 1888-'84 provide for the following forces, constituting the peace establishment of the British imperial army :

PEACE FOOTING.	Officers and men.
Cavalry.....	16,998
Artillery.....	84,044
Engineers.....	5,732
Infantry.....	192,004
Colonial corps.....	2,475
Administrative troops.....	8,025
Total regular army.....	199,278
Regular-army reserve.....	48,000
Yeomanry and militia.....	151,793
Volunteers.....	246,180
Indian native army.....	120,882
Total.....	761,138

The distribution of the regular army, as proposed in the army estimates, is as follows :

STATIONED IN—	Number.
The United Kingdom.....	111,058
India.....	61,641
Gibraltar.....	5,198
Malta.....	5,989
South Africa.....	8,843
Halifax.....	2,269
Antilles.....	2,567
Bermudas.....	1,594
Hong-Kong.....	1,214
Ceylon.....	1,286
Singapore.....	1,028
Other colonies.....	2,404
Total regular army.....	199,278

The total number of troops with the colors, on Feb. 23, 1888, was 196,282.

There is a force of military police, 14,000 strong, not provided for in the army estimates; also, a native military police in India, numbering 190,000 men, the superior officers of which are English. Most of the colonies have militia and volunteer organizations.

The scarlet uniform, which has for many generations been worn by British troops, is about to be discarded, in accordance with the report of a committee of military and scientific experts, notwithstanding the sentimental attachment of a large portion of the public to the traditional color of conservative military circles, represented by the Duke of Cambridge, who, during the discussion, discoursed with effusive feeling of the "thin red line" of the British army in the field. Out of consideration for this sentiment, and for the attractiveness of the bright colors to recruits, the committee recommended that the red uniforms, with pipe-clayed belts, together with the blue uniforms of the marines and green ones of the rifle corps, be retained for full dress. The committee found a dark shade of the *khakee*, or earth-color, in use in the Indian army, and a darkish gray, equally invisible at long distances; but recommended that the gray be adopted as the uniform color, with brown for the belts and haversacks, since it proved a more permanent dye than the *khakee*.

The Navy.—The *personnel* of the navy, according to the navy estimates of 1888-'84, is as follows :

TROOPS AND CREWS.	Number.
Seamen.....	40,554
Boys.....	4,804
Marines (one half shore).....	19,400
Royal naval reserve.....	21,750
Total.....	79,508

Of the 240 vessels constituting the active navy in September, 1888, 128 were stationed in British waters, viz., 6 ironclads constituting the Channel fleet, and 9 constituting, with 6 other steamers, the first reserve; 27 vessels in port service, 39 school-ships, 4 royal yachts, 1 steamer on hydrographic service, 28 sailing-vessels, forming with the first reserve the coast-guard, and 8 vessels out of commission; 20 constituted the Mediterranean fleet, but this was temporarily increased by vessels detailed from the home station and elsewhere to 18 ironclads and 81 other vessels, together 44; 2 ironclads, 14 other steamers, and 1 sailing-vessel were stationed on the east coast of America; 1 ironclad, 6 steamers, and 1 sailing-vessel on the west coast of America; 8 vessels in Southern and Western Africa; 18 in India and Eastern Africa; 20, including 1 ironclad, in Chinese waters; 6, including 1 ironclad, on the Australian station; 5 were employed in hydrographic service, 5 were on the return voyage, and the remaining 10 were transports.

The armor-clad fleet numbered 8 iron-, 8 steel-plated, and 2 turret-ships of 10,000 tons and over; 8 iron- and 3 steel-plated frigates, 2 of the latter unfinished, and 6 iron- and 2 steel-clad turret-ships of between 8,000 and 10,000 tons; 14 ironclads, 2 building, in steel, and 1 ram of special construction of from 6,000 to 8,000 tons; 4 battle-ships, 1 turret-ship, and 2 rams of from 4,000 to 6,000 tons; and 7 turreted and 8 other ironclads of less than 4,000 tons' displacement, fit only for coast and harbor defense. Of the large vessels 12 are too lightly armored, and carry guns too small for ocean warfare, though most of them are swift and efficient as cruisers. Besides the vessels enumerated above, which make an efficient iron-clad fleet of 61 vessels, there are 9 which are relegated to the harbor service and 8 small ironclads which were built for colonial defense. Of the efficient navy 11 are turret and barbette ships of the heaviest armor and guns, among the strongest in the world; and 9 are smaller battle-ships of equally modern construction.

Finance.—The net revenues from various sources are stated in the finance accounts for the year ending March 31, 1888, as follow :

SOURCES OF REVENUE.	Amount.
Customs.....	£19,657,000
Excise.....	26,980,000
Stamps.....	11,841,000
Land and horse taxes.....	2,900,000
Property and income tax.....	11,900,000
Post-Office.....	7,200,000
Telegraph service.....	1,710,000
Domains.....	280,000
Interest on local advances and Suez shares.....	1,318,845
Miscellaneous receipts.....	5,267,611
Total receipts, 1887-'88.....	£89,004,456

The expenditures under the various heads are given as follow :

BRANCHES OF EXPENDITURE.	Amount.
Public debt	£29,673,097
Civil list	408,541
Courts of justice	502,690
Other charges on the consolidated fund	690,778
Public works	1,324,616
Civil departments	2,390,402
Justice, police, and prisons	6,642,145
Public instruction, science, and arts	4,331,367
Foreign affairs	673,313
Other civil-service expenses	1,213,659
Army	15,502,351
Charges on account of troops in India	1,100,000
Navy	10,408,904
Grant to India for Afghan war	600,000
Armed forces in the Mediterranean	2,800,000
Egyptian expedition	1,695,500
South African military expenses	14,000
Customs and inland-revenue service	2,370,201
Post-Office	3,232,500
Telegraphs	1,510,000
Packet service	719,625
Total expenditure, 1892-'88	£38,906,273

The revenue per head of the population was £2 9s., as compared with £2 8s. 7d. in 1881, £2 7s. 10d. for the five years 1876-'80, £2 6s. 10d. for 1871-'76, and £2 6s. 3d. for 1866-'70.

There have been many reductions in the rates of taxation within twenty years. The change of the malt duties and brewers' license-tax in 1881 to a beer duty and publicans' licenses effected an increase in the revenue from these sources from £8,444,401 to £9,095,040. The probate duties imposed in 1881 yielded £700,000, and the increase in the income-tax £1,800,000. The repeal of legacy duties and reduction of the income-tax in 1882 lessened the revenues by £2,624,000, which was partly made good by the £654,500 produced by the additional probate duties. Before 1877, incomes above £100 paid income-tax. In that year exemption was extended to incomes not exceeding £150, with £120 abatement on those below £400. The gross amount of incomes assessed in 1880 was £576,896,901. The rate of the tax is altered almost yearly, according to the exigencies of the treasury. The amount produced by the tax varied from £4,109,000 in 1876, when the rate was 2d. in the pound, to £10,650,000 in 1881, when it was 6d., or 2½ per cent.

The state of the public debt on the 31st of March, 1883, was as follows:

Consolidated debt	£712,693,994
Terminable annuities	29,492,125
Unfunded debt	14,185,400
Total	£756,371,519

Adding the deficits due to savings-banks (£1,804,417), and deducting the approximate value of the Suez Canal shares (£32,491,600), the actual debt amounted to £725,689,336. The amount to be applied to the interest and reduction of the debt was fixed by the act of 1875 at £28,000,000, to be maintained by annual votes of Parliament.

In 1885 annuities, £5,200,000 in amount, expire, freeing so much of the revenue, which could be applied either to the reduction of taxes or to the amortization of the national debt. The Government determined to devote the entire annual sum to this latter purpose,

and obtained the authorization of Parliament to replace the expiring annuities with new terminable annuities, which will reduce the capital of the debt £178,000,000 in twenty years. The operation will not be transacted in the open market, but through the medium of the Court of Chancery, which has its funds, amounting to £40,000,000, invested in consols, and of the National Debt Commissioners, who hold national debt stock on account of the Savings-Bank. The £40,000,000 of Chancery stock is to be canceled and replaced by an annuity of £2,674,168, running twenty years; of the Savings-Bank stock, £30,244,000 will be canceled at once and converted into three annuities of £1,200,000 each, for five, ten, and fifteen years respectively, which on expiration will be renewed, and increased by amounts representing the interest of the canceled stock, and equivalent amounts of consols canceled, the entire sum being £183,019,208. The annual sum of £28,000,000 established as the annual debt charge is thus continued. The reduction proceeding through the operation of the unexpired life and terminable annuities, and the new and old sinking funds, is not interfered with. If the extinction of capital stock effected through the new annuities causes 8 per cent. consols to rise above par, the advisability of an operation for the reduction of the rate of interest might become a subject for practical consideration.

The receipts of the local administrations of the three kingdoms, for the year 1880-'81, were as follow:

LOCAL RECEIPTS.	England and Wales.	Scotland.	Ireland.	United Kingdom.
	Pounds.	Pounds.	Pounds.	Pounds.
Rates	24,513,914	2,831,000	2,637,423	28,982,347
Tolls, dues, etc.	5,015,327	1,059,000	454,570	6,528,927
Public property	1,017,544	292,000	69,640	1,379,184
Government contributions	2,708,223	546,000	114,857	3,369,080
Loans	12,987,523	905,000	401,504	14,294,027
Miscellaneous	5,366,502	414,000	174,446	5,954,948
Total	53,867,048	6,047,000	3,572,349	63,486,407

The total expenditures by local and municipal administrations were as follow:

LOCAL EXPENDITURES.	England and Wales.	Scotland.	Ireland.	United Kingdom.
	Pounds.	Pounds.	Pounds.	Pounds.
Public charity	9,053,019	922,348	1,129,561	11,105,928
Municipal government, police, and public health	25,020,941	2,665,000	2,070,415	29,756,356
Other expenditures	9,813,246	2,358,796	737,837	12,909,879
Total	53,897,206	5,946,144	3,937,813	63,781,163

Session of Parliament.—The fourth session of the present Parliament, the tenth of the reign of Queen Victoria, was opened by commission February 15th. The Queen's speech expressed gratitude to the army and navy for the suppression of "a formidable rebellion in Egypt," and said that the arrangements for the reconstitution of the Government of Egypt would

be submitted to the consideration of the Sultan and the powers. The restoration of Cetewayo was justified as a guarantee of peace and order. Continued improvement in the social condition of Ireland was shown in the sensible diminution of agrarian crime and the regular enforcement of the law; at the same time, the existence of dangerous secret societies called for unremitting vigilance on the part of the Executive. The legislative programme embraced bills on the subjects of a criminal code, criminal appeal, bankruptcy, patents, corrupt practices, perpetuation of the ballot act, etc. The establishment of municipal government in the metropolis was promised, and reforms of local government in other parts of the United Kingdom, if time permitted. Other measures, to conciliate the neglected constituencies of Great Britain, were bills relating to police and universities in Scotland, and to education in Wales; while, as a peace-offering to the Irish, some of their legislative wants, not yet provided for, were to be dealt with. To the tenant-farmers of England and Scotland was extended the promise of compensation for agricultural improvements.

The fourth session is usually regarded as a critical period in the life of a ministry. The Government had provided itself with a new machinery of legislative procedure, in order to redeem the pledges and bring up arrears of legislation. A debate on the Queen's address, extending over eleven sittings, eight of which were taken up with the discussion of Irish affairs, followed by a long wrangle over the question of admission to Parliament, the free ventilation of Irish grievances, questions without end, attacks from the skirmishing "fourth party," and the resort to more obstructive and troublesome tactics by members of the regular Opposition, unchecked by Sir Stafford Northcote, were in a measure the result of cutting loose from the traditions of the House, and introducing stringent disciplinary regulations. Yet the Government was afraid to apply the *obture*, though out-of-doors the ministers complained of obstruction.

The novelty of grand committees worked clumsily. Frequent changes in the order of business made by the Government provoked discussion and opposition, and the concurrent activity of the grand committees and the House confused the work of legislation. The procedure of the committees was intended to be more business-like than the forms of the House, but in the end the committees developed into a mere duplication of the House of Commons. The committee-room is provided with benches for the members of the two parties on each side, from which they rise to speak and address the Chair. The experiment of "devolution" was hardly successful. Of the four bills referred to the grand committees, three were sent back to the House of Commons, of which two afterward became law; but, owing to the pressure of other busi-

ness, not one had been considered on report at the close of July, while the House of Lords had not received any of those or other ministerial measures of the first rank. In August, the legislation of the session was rushed through the thin and dwindling House with a precipitant hurry that furnished, in the speeches of the Opposition during the recess, one of the chief points in their arraignment of the Government. The London municipality, criminal code, river conservancy, ballot perpetuation, and criminal appeal bills fell to the ground. The Government sustained several remarkable defeats, such as the resolutions in favor of the reduction of local taxation and of restrictions on cattle-importation on account of foot-and-mouth disease, which were distinctly Conservative proposals, and notably the rejection of the affirmation bill; also the motion in favor of sixpenny telegrams, the rejection of Mr. Childers's plan for collection of the income-tax, and the abandonment of the Suez Canal agreement on account of the public hostility it provoked. The explosives, affirmation, national debt, and Scotch local government board bills interrupted the regular programme announced in the address. The more important of the positive fruits of the session were the agricultural-holdings bill for England and Scotland, the corrupt-practices bill, the bankruptcy bill, the patents bill, and the national-debt bill.

The Affirmation Bill.—On the first day of the session the Speaker read a letter from Mr. Bradlaugh, announcing that he would present himself to take the oath. Lord Hartington gave an assurance that the Attorney-General would at once bring in an affirmation bill. Mr. Labouchere, the junior member for Northampton, engaged that his colleague would take no further step till the fate of the bill was decided. A bill to amend the law relating to parliamentary oaths was accordingly introduced, allowing any member who objected to the oath to substitute for it a simple affirmation. Notice of opposition was given, though on former occasions Sir Stafford Northcote had called upon the Government to settle the question by legislation. The chief obstacle to the bill was that it was supposed to be extorted by Mr. Bradlaugh's menaces. Public feeling in the constituencies caused many among the ministerial majority to abstain from voting, and a certain number to vote against the bill. The motion for the second reading was defeated in a very full House, 292 against 289. On the following day Mr. Bradlaugh again wrote to the Speaker, claiming his right to take the oath. The Speaker asked instructions, and then Sir Stafford Northcote moved that "Mr. Bradlaugh be not permitted to go through the form of repeating the words of the oath." Mr. Bradlaugh pleaded his cause from before the bar. The motion was carried by a large majority.

On Mr. Bradlaugh's announcement that he

considered the action of the House invalid, the order to the Sergeant-at-Arms to exclude him was revived. He then, after an attempt to enter the House, brought an action against the Sergeant-at-Arms, as a means of having his status determined by the courts. On the 9th of April, in the case brought against Mr. Bradlaugh to recover penalties for unlawfully sitting and voting in the House of Commons, it was finally decided that only the crown, not a common informer, could sue for the penalties. In December, Mr. Bradlaugh won his suit against the Sergeant-at-Arms for unlawfully ejecting him from the House on August 8d; for, though, the authority of the House is absolute, it has provided no ordinance to protect its officers in carrying out such of its orders as contravene the common law.

Act against Corrupt Practices at Elections.—The bill against corrupt and illegal practices at elections contains stringent provisions to check treating, bribery, undue influence, and personation. The detection of corrupt practices disqualifies the candidate for sitting in Parliament, voting, or holding an office, for seven years, and for ever representing the constituency in which the offense is committed. Bribery, treating, and undue influence, are misdemeanors, punishable with a year's imprisonment. Mr. Parnell and his friends raised unavailing objections to the elastic character of the latter offense. Personation is made a felony. A maximum sum is set, beyond which election expenses can not be incurred. The legitimate expenses of election are minutely regulated. Conveying voters to the polls in vehicles is forbidden. Excessive payments, employment, and hiring are prohibited in careful terms. Mr. Broadhurst, the working-men's representative, proposed to have election expenses defrayed out of the rates, but Mr. Gladstone refused, on the ground that it would be a breach of faith with the Opposition. The expected effect of the measure is to reduce the cost of a general election from £2,500,000 to £800,000.

Compensation for Tenants' Improvements.—The agricultural-holdings bills encountered the opposition of the land-owning interest and of the liberal advocates of free contract. Several organizations for the remedy of defects in the landlord and tenant laws pressed the subject on the attention of the Government, notably the Farmers' Alliance. Compensation for tenants' improvements was recognized as a right inalienable in ordinary cases by contract; the measure was to be the value of the improvement to the incoming tenant. For the execution of permanent improvements the landlord's consent was required; temporary improvements could be carried out without consent, although for drainage-works the tenant was required to give notice to the landlord, with the option to the latter of executing the work himself and charging interest on the outlay. The Duke of Richmond's amendment, exclud-

ing from the value of improvements to be assessed whatever is due to the "inherent qualities of the soil," was accepted. The Marquis of Salisbury only yielded the last day of the session on an amendment depriving tenants of compensation for improvements undertaken for the implied consideration of a reduction of rent. The power of distress was limited by the act to one year's rent, with exemption of breeding-stock, etc.

Bankruptcy Bill.—The distinctive feature of Mr. Chamberlain's bankruptcy bill is the official examination of the circumstances of insolvency. There are sixty official receivers, created for the purpose of inquiring into the conduct of the bankrupt, and exercising a supervision over the collection and division of the assets, so as to insure fair treatment to all the parties concerned.

Patent Law.—For many years, unfavorable comparisons with the American patent laws have been common, and demands made for measures better calculated to encourage invention. The new patent law, going into operation Jan. 1, 1884, reduces the charges from £25 for three years to £4 for four years. For the full term of fourteen years, however, the fees amount to £154. Instead of making seven different visits to the patent-office, the inventor need only file his declaration and provisional specification, and then within nine months the definite specification. The documents, with £1 stamp attached to the first and £3 to the second, may be sent by post. The preliminary specifications are officially examined as to priority and patentability, and the complete specifications are made public, and rival claims must be brought in before two months; otherwise the patent is issued. After the lapse of the term of fourteen years, an extension for seven or fourteen years may be obtained. Foreigners can take out patents in their own names. The jurisdiction of the Lord Chancellor, Master of Rolls, and Attorney-General, who as Commissioners of Patents had the direction of the department, is abolished, except in appeals on legal points. The business is intrusted instead to a Controller-General of Patents, subordinated to the Board of Trade. If a patentee is unwilling to work his invention, the President of the Board of Trade can issue licenses to other parties, who remunerate the inventor at rates assessed by valuers. A patent can be annulled on the establishment of priority by another, but the contestant, in case his suit fails, is liable for damages. A patent can cover only a single invention.

The patent law contains provisions for the protection of designs, models, and trade-marks. Protection for designs lasts five years from the date of registration. A design which is in use in a foreign country must be registered in Great Britain within six months to obtain protection. No distinction is made between ornamental and useful designs; but such of the latter as consist in a mechanical action must be patented.

The protection of registered trade-marks lasts fourteen years. Firm-names, when printed or stamped in peculiar and distinctive characters, monograms, and fanciful words, are subjects of protection as trade-marks.

Labour Legislation.—The success of the British working-men in obtaining legislation to correct particular abuses, through their powerful trades-unions and their representatives in Parliament, deters them from engaging in the discontented agitations for sweeping theoretical reforms which are rife in other countries, and formerly were in England. The measures for their benefit and protection are gained only by contests with equally powerful and vigilant organizations which claim vested interests in prescriptive practices. Even the law against paying wages in public-houses, which was carried by the efforts of the trades-unionists, though not needed for themselves, since they insist on wages being paid on the premises, encountered vigorous opposition from the Liberty and Property Defense League and the Licensed Victuallers' Association. An act prohibiting girls under fourteen years of age from working at forges was opposed by the Government and rejected, in spite of the earnest representations of the trades-union representatives. Regulations for the sanitary protection of workers in white-lead factories and bake-houses were enacted, though contested warmly, as undue legislative interference. The provisions of the bankruptcy act were also extended in a limited way to workmen, who can secure a discharge in bankruptcy and have £20 worth of tools and household goods exempt; but the tradesmen's associations secured a provision authorizing the judge to issue an order against future wages. The same act gives the workman a preferred claim against a bankrupt employer's estate for £50, or four months' wages, instead of two months' wages as formerly, thus placing him on the same footing as clerks. A fishing-boats' act protects apprentices from cruelties as revolting as any in the records of slavery, and was suggested by heinous instances recently come to light. The employers' liability act does not work, yet the efforts of the trades-unionists to procure its amendment were futile. The number of cases decided under the act was greater in the second year of its operation than in 1881, 820 against 126; of these not quite half were won by the plaintiff, or settled out of court.

Criminal Code Bill.—The bill to codify the laws of criminal procedure was loaded with amendments, and finally dropped in committee. It was a significant measure, embodying among the recommendations of the royal commission on procedure some of the remarkable innovations, borrowed from the practice of Continental countries, which were already introduced in the extraordinary legislation for Ireland. They were suggested by the discovery of explosives at Birmingham, and other evidences of conspiracy in England. One section

allowed magistrates to hold inquiries where no one was accused of crime. The Continental system of examining suspected persons was introduced, and trial before a special jury against the will of the prisoner was proposed. The doctrine of constructive criminality was extended.

Minor Legislation.—The explosives act, introduced after the dynamite discoveries in Birmingham, was brought in on the 9th of April, and passed through all its stages in both Houses the same day. In the bills granting pensions to Lords Wolseley and Alcester the Radicals and Land-Leaguers forced the Government to substitute lump sums of £25,000 for annuities. Sir Wilfrid Lawson's annual resolution in favor of local option received for the first time the formal approval of the Government and was carried. The long-decried contagious diseases acts were finally rescinded, some members of the Government declining to support them. The regular motion in favor of woman suffrage found this year 114 supporters to 183 opponents. A bill to suppress pigeon-shooting passed the lower House but was thrown out in the House of Lords. The bill to allow marriage with a deceased wife's sister was defeated in the House of Lords by parliamentary strategy. The committee of ten, one half from each House, appointed to consider the advisability of sanctioning the Channel tunnel, reported, July 10th, against the scheme on strategic grounds.

Irish Legislation.—By skillful and cautious tactics, allying themselves as far as was consistent with the Conservatives in their assaults on the Government, and by utilizing every point of agreement on Irish affairs with any of the sections of the Liberal and Conservative parties, and the desire of the Government to avoid a collision, the Irish party succeeded in having the Irish legislation of the year largely modified to suit their views, though the Government refused to entertain their proposals to reopen the questions assumed to be settled by the land act, to repeal the land act, and to relieve the distress in the west by public improvements and migration. They arrested the passage of the criminal code bill, and of Irish Sunday-closing and police bills. An Irish registration bill, opposed by the Conservatives as a measure for extending the franchise, was accepted by the Government; it was crowded out, but pledges were given to reintroduce it in the next session. Although the principle of relief-works was ostensibly rejected by the ministry, it was embodied in two Irish bills. One of these, the tramways bill, for constructing, with the aid of a state guarantee, tramways and light railways and for other purposes, embraced a proposal for state-aided emigration. This was vigorously opposed by the Irish members, who forced the Government to make a state grant for the trial of their alternative scheme of migration. The other bill provides for the improvement of fisheries on the Irish coast by the construction of piers and harbors with funds

advanced from the Irish Church surplus. T. P. O'Connor's laborers' bill enables the rural sanitary authorities to provide dwellings for laborers through the medium of the Board of Works by treasury loans.

A section of the Liberal party showed a desire to give a wide extension to the principle of local self-government.

The Conservatives pressed for the amendment of the Bright or purchase clauses of the land act, asking to have the Government extend more liberal loans and otherwise encourage the peasants to buy their holdings before they become further depreciated.

The amendments offered by the Land League proposed to make judicial rent run from the date of application, to give the court power to suspend proceedings for ejection pending the determination of a fair rent, and to declare improvements to be by presumption the tenant's property. Mr. Parnell proposed furthermore to admit to the benefit of the act the leaseholders, 100,000 of the flower of the Irish tenantry, who are now for the most part rack-rented.

Foreign and Colonial Policy.—Egyptian affairs were made the subject of pertinacious inquiry in Parliament, rather than of direct attacks, except by Irish and independent members.

On July 10th the agreement made provisionally with M. de Lesseps, recognizing the exclusive right to build a canal on the isthmus, was communicated to Parliament. The storm which it excited raged more violently outside the House of Commons than inside. (See SUZEE CANAL.) The South African policy of the Government was more vigorously assailed than the Egyptian policy, in which it was credited with having carried out Lord Beaconsfield's ideas, and, as being in some sense still "under fire," was not to be closely criticised, provided Egypt were not relinquished. (See CAPE COLONY.)

Of the questions raised regarding French action in Tonquin, on the Congo, and in Madagascar, the ministry treated that of Mr. Shaw's arrest only as a matter of direct concern. Reparation was secured in the form of an indemnity to the missionary. In all questions of foreign policy great care was taken to avoid wounding French susceptibilities. The Ibert bill aroused in and out of Parliament the most intense and resolute opposition of any part of the Government's policy. The Government adhered obstinately to the measure until the end of the year, but only to yield at last and offer a compromise, which was still not acceptable. (See INDIA.)

Political Parties.—The tendency of the Ministerial party in 1883 was to follow more and more the counsels of the advanced and stalwart section, particularly of Mr. Joseph Chamberlain, who conducted the most difficult and important legislation of the session. The plan of closer party co-operation in the constituencies has worked better since the novelty wore off, and the organizations assumed a less arti-

ficial form. The Conservatives, who at first loudly decried the "caucus," and predicted the demoralization and "Americanization" of politics, imitated it themselves by founding Conservative clubs. The Radical section of the Liberals was ready with a programme for the session of 1884 soon after Parliament. It was the assimilation of the borough and county franchise first, and a London municipality next.

The Conservatives continued to be led by the Marquis of Salisbury in the House of Lords, and by Sir Stafford Northcote in the House of Commons. Commotion in political circles was created by a letter from the pen of Lord Randolph Churchill, printed in the "Times" in April, calling upon the party to decide on one of these or on Lord Cairns for its leader, and advocating the claims of Lord Salisbury. The latter, without assuming such pre-eminence, was more strenuous and active than ever, and rallied about him the more vigorous spirits of the party. Sir Stafford Northcote, after the close of Parliament, attempted a Mid-Lothian campaign in Belfast, but only succeeded in arousing dangerous political and religious passions, and stirring the fires of hereditary strife in Ulster. The party suffered from the ill-health of its leader in the popular House. Conservative successes in some of the bye-elections indicated dissatisfaction with the course of the Government in some particulars, but were not sufficiently marked to pre-empt a return to Conservative guidance. The Marquis of Salisbury's gloomy warnings of the destruction of the Constitution, confiscation and communism, and Americanization of British institutions, met with no popular response. His party offered no positive programme, no constructive ideas with which they could appeal to the constituencies. The scheme of tenement-house reform, the propositions to lighten local taxation, and vague and immature projects to protect the British farmer, are the principal bids for popular support.

The Irish National Party.—The conflict between the Government and the Irish leaders was not renewed in 1883. The latter ceased their agrarian agitation, because the farmers were in a measure satisfied with the advantages secured under the land act. Warned by the revelations of conspiracy and the hideous crimes, for which the Land League was made answerable, they perceived that the active agitation of the national question would appeal chiefly to the desperate revolutionary minority, and result in the relentless destruction of their organization by the English Government. The land act embodied the principles on which they proposed to settle the land question.

The most remarkable incident of the debates was the controversy between Mr. Forster and Mr. Parnell in the debate on the address. The ex-Chief Secretary for Ireland, on February 22d, rose to explain the motives for his resignation. The main reason he declared to be his inability to obtain the powers he desired.

He suspected the Land League of a connection with agrarian crimes. The Government called upon him to release the imprisoned leaders without requiring a public promise, which he expected, if given, would have the effect of detaching the violent section from the Land League, and of shutting off the contributions from America. Sheridan, whom the Land-Leaguers proposed to employ to pacify the west of Ireland peasants, he knew to be a conspirator in secret societies. Mr. Forster now reiterated his suspicions of the Land-Leaguers, charging Mr. Parnell with either conniving at outrages, or, when warned and informed by facts, deliberately remaining in ignorance, and taking no pains to ascertain what was going on. He renewed the charge that the faint expressions of disapproval on the part of the Land-League orators operated as an encouragement to murder and outrage. Mr. Parnell replied in a contemptuous tone, prefacing his explanation by saying that he did not expect to make any impression on the opinion of the House, or English public opinion, and only desired to set himself right before the people of Ireland. He said that, since the passage of the crimes act, he had taken very little part in Irish politics, because such a state of affairs was created by the act that, between the Government and the secret societies, it was impossible for a constitutional agitation to exist.

In October, 1882, the "Irish World" declared the Land-League fund to be closed, and stated the amount sent to Mr. Egan at \$342,548. This organ of the Irish Nationalists of America henceforth attacked Mr. Parnell and his party for not adopting the views of Michael Davitt and Henry George. It frequently called for an accounting from the treasurer of the League. Charges of misappropriation were echoed by Lady Florence Dixie, who, some time later, March 17th, puzzled the English police by a sensational account of a desperate attempt to assassinate her at her country residence near Windsor. Patrick Egan declared, in a letter to the "Irish World," at the beginning of January, that the total sum expended out of the Land-League funds for election expenses was £2,550.

When Parliament met, Mr. Healy was still in prison, and became the subject of earnest protests from his fellow-partisans. An ancient precedent was brought forward, which excludes refusal to give sureties to keep the peace, as well as treason and felony, from the privilege of Parliament. On the 4th of June he was released, together with Messrs. Davitt and Quin. Henceforward Mr. Healy took the lead of the aggressive section of the Irish party in Parliament, and in stinging taunts and embarrassing tactics showed himself a master.

The influence of the Irish party was shown in the elections, and by other signs, to have extended until it was no longer possible to question their claim to be the representatives of the Irish people. In the County Monaghan,

previously represented by Liberals, Mr. Healy won a memorable victory, coming out at the head of the poll, July 2d. His former constituency, Wexford, returned Mr. Redmond by a large majority over the O'Connor Don. Even in Ulster the majority of the tenantry had gone over to Parnell.

On May 22d the "Kerry Sentinel," in the office of which a printer had prepared a handbill adjudged to be seditious, was confiscated under the crimes act, and the editor, Mr. Edward Harrington, was sentenced to six months' imprisonment.

The friends of Mr. Parnell raised by subscription a fund to be handed over for his own use, as a national testimonial. In May a papal circular was issued, discountenancing the collection, an action in which the Pope was declared by the Irish party to have been influenced by the English Government through Mr. Errington. The admonition had but a slight effect in discouraging subscriptions. When the fund was finally delivered to Mr. Parnell, December 11th, it amounted to £38,000.

The Nationalist orators, in stumping the country after the close of the session, met with manifestations of confidence and enthusiasm more general than were exhibited during the heat of the land-conflict. Mr. Davitt was as popular as his former associates, addressing audiences of twenty thousand in Ballybriggan, Waterford, and Cashel. The Castle authorities furnished a fresh subject for invectives by suppressing meetings in County Clare. As the excitement increased, the Executive applied its authority more rigorously, and suppressed League meetings throughout Munster, Leinster, and Connaught; but in Ulster, where the National meetings could not well be suppressed without interdicting at the same time the excited "loyal" demonstrations, the hostile factions were left for a long time to their contentions without interference. The campaign in Ulster was the signal for counter-demonstrations, and was characterized by the familiar riotous collisions between the Orangemen and the adherents of the National cause. It became the systematic practice of the Loyalists to collect mobs and create a riot wherever a Nationalist speaker was announced to make an address, and thus repel the "invasion" of Ulster. At Londonderry, November 2d, a meeting at which the Lord Mayor of Dublin, Mr. Dawson, was the orator, was the occasion for a serious disturbance. The Orangemen were armed, and several shots were fired. The leader of the mob, Lord Rossmore, was struck out of the commission of the peace, but the riot was made the pretext for yielding to the clamor of the English party and forbidding political meetings in Ulster. The suppression of meetings could not stay the general current of sentiment toward home rule. Mr. Healy declared, and his opponents acknowledged, that a general election would give the Nationalists, without any extension of the franchise, as many as seventy

seats in the House of Commons, to about twenty for the Conservatives and eight for the Liberals.

Political Crimes in Ireland.—The crimes act placed more arbitrary powers in the hands of the Irish Executive than any of the repressive acts which had preceded it. Before Lord Spencer and Mr. Trevelyan, juries rarely convicted a person accused of agrarian crime. The Government declared that this was because they were intimidated, while the Irish party asserted that the evidence was never sufficient to warrant a conviction. Under the new act, special juries were selected from a class who were more likely to convict than not. In Dublin, verdicts were brought in against the persons accused of three shocking assassinations. The Irish press denounced the proceedings as judicial murder, declaring that the judge's charge was partial, and that some of the jurors were intoxicated. Judge Lawson and juror Field were pursued by conspirators, and an attempt made to assassinate them on the street. Marines were brought over from England to assist the police in protecting judges and jurymen. For speeches made at this time, Messrs. Biggar, Davitt, and Healy, were summoned into court, and the two latter were required to find securities for their good behavior. This they refused to do, and they were sent to jail. Districts in Tipperary, Limerick, and Cork counties were proclaimed in January on account of agrarian outrages, and a Land-League meeting was interdicted in County Sligo. Further detachments of marines were assigned to police duty in different parts of Ireland. Mr. W. O'Brien, editor of "United Ireland," was committed for trial on account of his accusations against the judges and juries, and two days afterward was elected to Parliament for Mallow by a considerable majority over the Solicitor-General, Mr. Naish. He was discharged February 10th, owing to disagreement of the jury. In January the long list of executions began, with Patrick and Thomas Higgins, and Michael Flynn, at Galway, hanged for the murder of Lord Ardilaun's bailiff at Lough Mask, and Poff and Barrett at Tralee for Thomas Brown's murder. On March 2d twelve men were sentenced to imprisonment for conspiracy to murder and rebel, the specific charge being a plot to murder landlords as a class.

The Government was able to assert in 1883, for the first time in years, that order prevailed, and that the Queen's writs could again run in Ireland. This was sometimes attributed to the operation of the crimes act, and the energy of the Irish Executive, at other times to the beneficial workings of the land act. The suppression of lawlessness, and the breaking-up of secret bands of assassins, were a preventive, but, on the other hand, the exercise of despotic power and the suspension of ancient liberties were provocative of violence. The general cessation of the revolt against rent and of boycotting limited the occasions which were likely

to produce breaches of the peace. The Chief-Secretary took credit for the fact that the number of outrages, exclusive of threatening letters, was reduced to 365 for the last six months of 1882, from 1,010 in the first half of the year, and 1,257 in the last half of the preceding year. The peasantry ceased their opposition, which was the latest piece of tactics generally employed against the landlord class. On May 1st the Lord Lieutenant published a list of awards of indemnities assessed on localities for agrarian crimes, some of them several thousand pounds in amount. In July a gang of conspirators in Sligo was detected, after an attempt to blow up a house with dynamite.

The Phoenix-Park Assassins.—The police was placed under the direction of Mr. Jenkinson, an official whose experience had been gained in Indian administration. A crafty detective service was organized. Their clues and purposes were concealed, while, with the help of information, betrayed in the inquisitorial judicial examinations which are allowed under the crimes act, they ferreted out an organized band of political assassins in Dublin, an offshoot of the Fenian Brotherhood. On January 14th seventeen persons were taken into custody, charged with conspiring to murder officials. They were mostly men under thirty, belonging to the artisan class. The most prominent was James Carey, a contractor and builder, who was a member of the Dublin Town Council. In the judicial inquiry one of them, named Farrell, turned state's evidence. Other evidence was collected from Kavanagh, another confederate. Subsequently Carey, who was one of the chief conspirators, induced by promises of immunity, turned informer, and revealed the history and character of the conspiracy. In November, 1881, Carey, who had been a director in the Fenian organization, was introduced by McCaffrey, one of the prisoners, to a man who passed by the name of Walsh. The latter said that he had come from England to establish a branch of a secret society which was to "make history." It was called the Irish Invincibles. The object of the organization was "to remove all tyrants from the country." It would number not over 250 members in the three kingdoms, picked men from the Irish Republican Brotherhood. McCaffrey, Carey, James Mullet, and Daniel Curley, a Fenian center, were sworn as the first members and chiefs of the Dublin branch, which was not to exceed fifty members. They inducted about twenty-five others. The oath was to obey the orders of the Irish Invincibles without inquiring more than was necessary to understand them, on pain of death. P. J. Sheridan, known previously as an influential agent of the Land League, who went disguised as a priest; a man called McCafferty; a woman, supposed to be a Mrs. Byrne, whose husband was secretary to a land confederation in England; and later a man supposed to be the chief of the organization, who was known only as

"No. 1," held communication with them, and furnished them with weapons and liberal gifts of money. Mr. Forster and Lord Cowper were designated as the persons first to be removed, and next Mr. Burke. The Invincibles, under orders from "No. 1," lay in wait for Mr. Forster several days in the early part of March, 1882. Joseph Brady, a stone-cutter; Timothy Kelly, a coach-builder; Thomas Caffrey; and Patrick Delaney, who shortly before the trial had been sentenced to ten years' imprisonment for another political crime—the assault on Judge Lawson—were the four occupants of the car in Phoenix Park on May 6th. They were driven by a professional car-driver, Fitzharris, *alias* "Skin the Goat." Carey signaled from another vehicle, and Curley had the direction of the arrangements. It was intended only to kill Mr. Burke, and Brady struck the blow; but, when Lord Frederick Cavendish struck him with his umbrella and called him a ruffian, Brady followed after and stabbed him also.

Frank Byrne was apprehended in Paris, February 27th. The English Government sought his extradition, on the charge of complicity in the Phoenix-Park murders, and then on a new charge of complicity in the attempts on Justice Lawson and Mr. Field. The procureur examined him, and on March 8th released him from custody. He then went to the United States, where Sheridan had found a refuge, and whither John Walsh, thought to be the "No. 1" of Carey's revelations, followed, after being arrested at Havre, and set at liberty. Applications made to the United States Government for the arrest and extradition of Sheridan were not entertained.

The trials of the prisoners began with that of Brady, on the 9th of April. He and Curley, and the youth Timothy Kelly, who, with Brady, struck the fatal blows, preserved a bold demeanor. With the evidence of Carey and seven other informers the proofs were complete; though Kelly was held up as a martyr who died rather than betray his companions. The three named, with Caffrey, Fagan, and Delaney, were sentenced to death; Fitzharris to penal servitude for life, to which penalty Delaney's sentence was commuted; Joseph Mullet, for the attack on Justice Field, was sentenced to the same; James Mullet, Daniel Delaney, McCaffrey, O'Brien, and Moroney were sentenced for ten years, and Thomas Doyle for five. True bills for murder were found against Walsh, Sheridan, and Tynan. The latter was identified as the mysterious "No. 1." Brady was executed on May 14th, Curley on the 18th, Fagan on the 28th, Caffrey on the 2d of June, and Kelly on the 9th.

Dynamite Plots.—The secret orders of Irish revolutionists, disappointed at the peaceful issue of the Land-League agitation, and exasperated by the rigorous repressive measures adopted by the English Government in Ireland, were more active in 1888 than they had

been for years. Bands of conspirators formed in the United States as well as in the British Islands. Since Ireland was too well guarded, they made England the scene of their plots, the object of which was to terrorize the English people and Government, and keep alive in Ireland the cause of national independence. O'Donovan Rossa, in New York, had for a year or more proclaimed the "gospel of dynamite," and threatened the destruction of British ships and public buildings. On January 20th a tin box was found in Glasgow, which exploded and injured five persons. An attempt was made to blow up the gas-works in that city. On March 20th a terrific explosion occurred in the Local Government Board office in London. The explosive substance was placed on a window-sill. The effect was simply to make a hole in the massive stone wall of the building. A can of dynamite was placed against the "Times" office, but was accidentally overturned before it exploded; an analysis showed it to be identical in composition with that found in Glasgow. After this all the public buildings in London were guarded by night and day.

In April the organization which perpetrated the dynamite outrages was unearthed, and several of the most active agents of the conspiracy were arrested. The evidence obtained left it no longer a mere suspicion that the crimes were connected with the threats uttered in one of the American organs of the Irish revolutionists, and that the plots were partly concocted in the United States and the pecuniary means largely supplied from thence. Infernal machines had been known to be imported from America. This time the explosives were produced in England. A man named Whitehead rented a shop in Birmingham, where he ostensibly carried on the business of a paper-hanger and oil-merchant. Large consignments of chemicals sent to him by neighboring manufacturers excited the suspicions of a police officer. He bought glycerine in great quantities from one firm, and strong acids from others. The glycerine he said he sold to hair-dressers and others. When the police ascertained that his purchases consisted of the constituents of nitro-glycerine, and saw that he did no business in his shop, they first examined the premises in his absence, and then arrested him for making and keeping an explosive substance with intent to commit a felony. From Whitehead's shop the detectives traced a young man to London, and learned who were his associates. He was arrested with a box in his possession containing 200 pounds of dynamite, which he had brought the day before from Birmingham. He described himself as William James Norman, a medical student. A man named Gallagher, who had in his possession nearly £900 in English and American notes, was next arrested, with four others in London, and Gallagher's brother in Glasgow. In Whitehead's place

were found many carboys of acids and cans of glycerine, with large quantities of dynamite in various stages of manufacture. These discoveries and arrests created a panic throughout England. The people of Birmingham left the city almost deserted. Sir William Harcourt framed the explosives act, and Parliament passed it with an expedition not paralleled since the suspension of *habeas corpus* in 1866. Within a few days Norman, whose true name was William Joseph Lynch, made a full confession. He was born in New York city, and was a carriage-maker. He joined a secret oath-bound society which met in the Bowery in New York, and had for its object the achievement of the freedom of Ireland by physical force. The society seemed to be divided into small groups, like the Russian Nihilists, and the members of each group knew each other by numbers. He heard frequent mention of "the old man," whom he understood to be Rossa. He was summoned to go on a mission for the society, and was directed to Gallagher. The latter was a young physician in Williamsburgh. Gallagher furnished him liberally with money, and ordered him to take passage for England. In London he met him again, and after several days of preparation sent him to Whitehead for the first package of dynamite, which was found in his room when he was arrested the night after his return. In their walks about London Dr. Gallagher pointed out to him the Parliament House and other buildings which would have to "come down." The prisoners were tried for treason-felony in June: Dr. Thomas Gallagher, Henry Wilson, Whitehead, and John Curtin were convicted and sentenced to hard labor for life; the rest were acquitted.

Murder of Carey.—The informer Carey was so generally execrated that the British Government did not venture to bestow on him a liberal public reward, such as was granted to the other informers and persons who were instrumental in bringing the murderers to justice. He displayed at the trial and later, with no lack of knowledge and natural intelligence, a character of singular baseness. The impulsive Irish people, who had been shocked at the Phoenix-Park assassinations, after witnessing the fortitude with which the condemned men had met their deaths, and the cowardice and heartlessness of their chief who had escaped, now turned upon him as the real criminal, and regarded them by comparison as misguided but devoted patriots. The English authorities consequently desired to get Carey out of sight and memory as soon as possible, and particularly to prevent vengeance being taken upon him by any of the many Irishmen who stood ready. The police kept him concealed, and, while avengers were looking for his arrival at American and Australian ports, got him safely embarked in the Kinfauns Castle for Cape Town. The vessel sailed from London July 4th. Carey was smuggled on board at Dart-

mouth, with his wife and seven children, under the name of Power. On the same steamer was a passenger who went by the name of Macdonald. He was Patrick O'Donnell, a California miner and naturalized citizen of the United States, forty-eight years of age, a man of resolute and adventurous spirit, who had lived in various parts of the world, and was probably connected with the Irish revolutionary societies. O'Donnell associated familiarly with Carey, and made sure that he was the informer. Carey's destination was the diamond-fields. At Cape Town they both changed to the Melrose Castle for Natal. When not far from port, on July 29th, while they were conversing in the cabin, O'Donnell suddenly called Carey by his right name, and drawing a revolver fired at him three times, in the presence of his wife, in whose arms he died in half an hour. O'Donnell was taken back to London, where the juries could better be depended upon than in South Africa. In Ireland and America he was extolled as a hero. Among the Irish of the United States over \$50,000 was contributed for his defense; and Roger A. Pryor and A. M. Sullivan were retained to assist the English counsel; but they did not seek to take part in the pleadings in view of the probable futility of the request, particularly in opposition to the advice of the English advocates, who thought that it would prejudice their client's case. The defense was, that Carey, when addressed in his own name, first drew a pistol. O'Donnell was convicted December 1st. Congressman Finnerty, President of the Irish National League of America, was joined by many other politicians in his efforts to induce the American Government to intercede, and a resolution was carried in Congress, in accordance with which the President requested a delay in the execution, in order to allow the prisoner's counsel to show points of error in the trial. The British Government listened to the representations of the counsel, and then returned an answer forthwith to Minister Lowell that there was no ground for postponement and reopening of the case. O'Donnell was accordingly hanged on the appointed day.

Condition of Ireland.—Throughout the year a controversy regarding the relief of distress in Ireland engaged public attention. The Government had taken the position that, as the distress was local, being confined mostly to the western counties, and as the laws and traditions of the empire made public charity a local charge, the boards of guardians must carry out the work, and the poor-rates supply the means. The Government also pronounced in favor of the scheme of emigration as the best means of relieving the congested districts, and, in view of the inadequacy of the statutory provisions in such localities, offered to give £5 to the local boards toward the expenses of sending each and every destitute person to a new country. The Irish patriotic party declaimed earnestly against the plan of depopulation as a remedy

for poverty. They advocated the adoption of a central system of relief-works, proposing as suitable and profitable objects the construction of railways, the reclamation of waste lands,* planting of barren districts to forests, and, as most important of all, a system of arterial drainage to cover the whole of Ireland. The Government could lend its credit to this scheme without loss, it was argued, because large areas in the most fertile districts are water-logged.

The scheme of emigration was begun in the spring of 1882, through the efforts of Mr. James L. Tuke, who undertook the task as a private benevolent enterprise, and received contributions which enabled him to settle during that year about 1,300 persons, from Connemara and neighboring districts, in the United States and Canada. The condition of the poorest class of Irish farmers was described by Chief-Secretary Trevelyan as more deplorable than that of any class of people in any civilized country. There are 67,000 farmers of less than five acres, and 160,000 of from five to fifteen, of which, in many cases, only two or two and a half acres are arable. The land has been spaded over and planted to potatoes until it yields only 90 cwt., instead of from six to nine tons. After the failure of the potato-crop in 1879, these people were reduced to the verge of starvation. The Duchess of Marlborough's fund (£130,000), the Mansion-House collections (£174,000), the Land-League relief fund, the "New York Herald" and other American relief funds, and the £1,500,000 from the Irish Church surplus, all but a sixth of which was apportioned out in loans and grants, helped to sustain them during that and the succeeding bad year, until, in the third year, there was an unusually good crop. A large proportion of the tenant-farmers of this class defaulted in their rent in 1881. Nearly 50,000 in the counties of Mayo, Donegal, and Galway resorted to the arrears act, to obtain the advantages of which it is necessary to pay a year's rent. This the new crop failure in 1882 placed beyond the power of very many. There were evidences of the return of acute distress in the winter of 1882-'83. Physicians observed the prevalence of the feebleness and disease resulting from low and unnatural diet, in which sea-weed took the place of more substantial food. The Government could not affect to ignore a state of things in which a large part of the population of the western counties were enduring semi-starvation, and hundreds of families were evicted from their holdings. The fact that the work-houses were only half full was but a specious excuse, as the work-houses could accommodate no more than a fraction of the suffering, and as it was known from experience that, owing to the strength

of household ties and their reluctance to leave their land uncared for, the work-house system is inoperative for the relief of want among the Irish peasantry. Out-door relief, which under the English poor-law system is lavishly bestowed, is practically prohibited by the poor-law regulations of Ireland.

Besides the scheme of public works to furnish employment, and the relaxation of the work-house test in the administration of public charity, as demanded by the Irish party, and the scheme of assisted emigration, favored by the Government, the improvement of the coast-fisheries and the encouragement of manufactures, were suggested by others as the only hope of permanently relieving the chronic agricultural distress of Ireland, by furnishing the people with other employments. Some believed that capital for industrial undertakings, such as linen-factories, etc., would flow into Ireland if it were not hindered by the agitation and incident disorders. Mr. Trevelyan, in reply to the demands of the Irish party, expressed the unwillingness of the Government further to burden the British tax-payers to assist the Irish. The advances made during the recent distress to furnish seed had been abused by the guardians of certain impoverished unions, who had dealt out the seed-potatoes for food to the people, in the expectation that repayment of the debt would never be required. Irish members denied that the British had ever been taxed for Irish relief. The famine-debt of 1847-'49, amounting to about £10,000,000, was remitted, but the Exchequer, they argued, was reimbursed by the imposition of additional taxes. While the tax on malt was reduced from 2s. 8½d. per bushel to 6d., that on whisky was more than trebled, producing in Ireland £3,000,000 in 1871 against £900,000 in 1851, and making the burden of imperial taxation equivalent to an income-tax of 5s. 8d. in the pound, while the taxes collected in England represented only 2s. 6½d. in the pound of the national income.

A memorial was received by Lord Spencer on the 9th of January from the Roman Catholic bishops of the west of Ireland. They stated that one half of the potato-crop and from one third to one half of the oat-crop had been lost; that the portion harvested was generally of inferior quality; that the rains had prevented the gathering of turf, causing a scarcity of fuel; and that the destitute, comprising from one fifth to one third of the population, had generally parted with their money and their stock to pay rent and arrears, and were in debt to the shopkeepers, who would give no more credit. The bishops proposed as a remedy for the distress, which would increase every week of the ensuing six months, unless relieved, that the Government should extend loans for the improvement of the holdings, rather than furnish employment on public works, which they considered demoralizing. The loans to the amount of five years' rent

* In 1849 a scheme contemplating the reclamation of about one million acres was adopted by Parliament, and money voted for the purpose. Only one quarter of that area was reclaimed, consisting of what is now as good arable land as there is in the country. Sir Robert Peel advocated in 1849 the extension of the works.

were to be secured simply by the tenant-right. The refusal of the Government to entertain this proposal elicited a reply from the prelates on the 11th of March, in which they declared it to be the duty of the Government then to provide out-door relief, and condemned the resolution, heartlessly avowed in Parliament, to sweep from the land by starvation, which was preferred by the people to the work-house, or by wholesale emigration, the laborers and small tenants. In Connaught there were nearly 2,000,000 acres of rich pasturage from which the fathers of these men had been evicted in famine-years, that, they thought, ought to be restored to their children, whom it was now proposed to transport in a mass.

On May 1st the time allowed to Irish tenants to take advantage of the arrears act expired. About 136,000 tenants altogether made application. The arrears cleared away amounted to about £2,500,000, toward which the state contributed £810,000.

State-aided Emigration.—At the end of March the first departure of emigrants aided by the state took place from Belmullet, in Mayo; 860 persons were shipped to Boston entirely at the expense of the Government, while additional assistance was furnished by the Tuke fund. After a number of parties were sent, the information was transmitted to the United States that some of the poor-law unions took advantage of the Government grant to ship their paupers to America. The American Irish raised an outcry, and the immigration authorities were prompt to act. One family, which arrived by the City of Richmond at New York in the beginning of July, was sent back. The steamship companies were notified that the law against landing paupers would be strictly enforced. The immigrants who arrived subsequently were thoroughly examined, and all who were unsuitable were returned, until the managers of the Tuke fund and the English officials took the pains to make the investigation before sending them out, and shipped none who could not legally be received.

Famine in Skye and the Western Highlands.—There was destitution in the western Highlands of Scotland, in the Hebrides islands, and on the coast of Ross-shire, attributable, as in Western Ireland, to the paucity of the productions on which the peasantry depend, and to similar agrarian conditions. The potato-crop and the herring-fishery, from which the inhabitants derive the principal part of their subsistence, both failed entirely in 1882. The grain-crops were also destroyed by hurricanes in the late autumn. The Highlanders formerly held the land in common, but the application of the modern English law gave the fee simple to the chiefs. The land has become more profitable for grazing, and even for hunting preserves, than for agriculture. The peasantry have consequently been displaced, and those who did not emigrate crowd each other in these infertile western districts. A croft of from four

to seven acres is made to support the increasing family until four or five cotters occupy the original patch.

Unseaworthy Vessels.—The President of the Board of Trade, Mr. Chamberlain, declared his intention of preparing laws to prevent the loss of lives on unseaworthy ships through the culpable negligence of their owners. Of 3,118 lives lost in 1882 from foundering, defective machinery, overloading, etc., not including those on wrecked vessels, he considered that a large proportion was chargeable directly to the owners, who, in order to carry more freight, or save expense in repairing, sent vessels to sea in an unseaworthy condition, risking the lives of all on board, while they were insured against loss. In December, a set of rules which Mr. Chamberlain proposed to embody in legislation, establishing a strict official inspection, was submitted for criticism to the bodies representing the shipping interests.

Blasphemy Trial.—The prosecution of George William Foote, George Ramsay, and H. A. Kemp for blasphemy created excitement in February and March. The charge was founded on a coarse attack on the Christian religion, holding the Saviour up to ridicule, which was published in the Christmas number of the "Freethinker." They were found guilty, and sentenced to prison for twelve, nine, and three months respectively.

Rifle-Match at Wimbledon.—The annual volunteer rifle contests at Wimbledon, opening July 8th, were favored by fine weather, except on the days on which the international match was contested by twelve picked marksmen of the British volunteers and twelve of the national guard of the United States. The British team won by forty-eight points. Their victory was in a measure due to their greater practice at long-distance firing, in which the element of chance largely enters, and to the rainy weather, with which they are more familiar. At the practical military distances the Americans led the score by a few points. The national challenge trophy was won by the Scotch twenty, and the Elcho shield by the Irish team, making the sixth victory for them, to the eleventh for England and the fifth for Scotland.

GREECE, a kingdom of Southern Europe. (For details relating to area, territorial divisions, population, etc., see "Annual Cyclopædia" for 1882.) The present Constitution was elaborated by a Constituent Assembly in 1864. The legislative power is exercised by a single Chamber of Deputies, elected for four years by direct vote. George I, King of the Hellenes, is the second son of the King of Denmark, born Dec. 24, 1845. He was offered the crown by the National Assembly, in accordance with a protocol providing for the annexation of the Ionian isles, signed June 5, 1863, in London, by the three protecting powers, France, England, and Russia, and began his reign October 31st of that year. The number of deputies in the Chamber is 187.

The ministry which was formed March 15, 1882, is composed as follows: President of the Council and Minister of Foreign Affairs, Mr. Tricoupis; Justice, since July 21, 1883, *ad interim*, Mr. Contostavlos; Finance, Mr. Kalligas; Public Worship, Mr. Lombardos; War, Mr. Karaschakis; Navy, Count-Admiral Tombazis, since July 21, 1883, *ad interim*; Interior, Mr. Tricoupis, *ad interim*.

The Consul-General of Greece, at New York, is Mr. D. N. Botassi. The United States Minister Resident and Consul-General at Athens, is Hon. E. Schuyler, and the United States Consul at Patras, Mr. E. Hancock.

Army.—The law of June 21, 1882, has thoroughly reorganized the Greek army. All able-bodied men are required to serve in the army during nineteen consecutive years, of which one is in the active army if the soldier belongs to the infantry, two if belonging to a special arm, eight or seven years in the reserve, and ten in the militia. The army is composed of 29,368 officers and men.

Navy.—The fleet consisted in 1881 of two steam ironclads and thirteen other vessels, besides two torpedo-boats and ten coasting craft; and there are building: two gunboats, thirty-six torpedo-boats, and two sloops with torpedo-boats.

Finances.—The national indebtedness of Greece on Jan. 1, 1883, was as follows:

DATE OF BONDS.	When to be canceled.	Number of outstanding bonds.	Original amount in drachmas or francs.	Present amount in francs.
1868	1896	88,324	5,932,800	8,400,836
1867	1895	70,568	20,000,000	17,843,250
1871	1899	18,261	4,000,000	3,815,250
1874	1918	49,230	26,000,000	24,690,000
1876	1920	28,700	10,000,000	2,000,000
1879	1919	117,890	60,000,000	58,695,000
1880	1924	283,000	120,000,000	119,025,000
		555,093	250,932,800	223,753,836

	Francs.	Francs.
1824-'25 of 100	23,513 × 25 francs =	8,782,500
" 150	708 × 25 francs =	2,682,250
" 500	843 × 25 francs =	10,587,500
	25,059	21,956,250
Not yet ascertained		21,956,250
Loan of 60,000,000 for protecting powers		53,828,000
Circulation bearing interest		17,800
Loan made from the National Bank		64,984,680
Loan made from the Ionian Bank		8,104,050
Due the heirs of King Otho		8,460,800
Total		851,631,566

The 170,000,000 Franc Loan.—By a vote of 110 against 56, the Greek Chamber of Deputies ratified, on Jan. 5, 1884, the agreement which the Government had made with a syndicate of members, who assumed a 5 per cent. loan to the amount of 170,000,000 francs. The price fixed was 68½ per cent. The net proceeds of this loan the Government proposed to spend in canceling its indebtedness to the National Bank and the Ionian Bank, for the purpose of resuming specie payment; to the extent of 12,000,000 francs in subsidizing railroads to be constructed, and various other items. The Government gave as security for

the loan the balances due for duties by the larger cities and the proceeds of the stamp and tobacco taxes, the latter estimated to amount to 15,000,000 francs in the future. The syndicate received as an indemnity for its expenses the sum of 230,000 francs.

Petroleum Monopoly.—The Greek Government has discovered that out of 22,000,000 litres of petroleum annually consumed, only 8,500,000 litres actually pay duty, the remainder being smuggled. The extent of coast is such that control is absolutely impossible, hence the Government intends transforming the petroleum-trade into a Government monopoly.

The Latin Union.—As Greece forms one of the European states composing the so-called Latin Union, having bimetalism for its basis instead of the sole gold standard, she has been invited by France to attend a preliminary meeting of representatives in 1884, the compact expiring by limitation in 1886, and France apparently wishing to have the arrangement renewed.

Postal Service.—The number of post-offices in 1880 was 143. These forwarded altogether in that year 8,828,754 letters and postal-cards, 1,206,986 newspapers, and 68,224 sample packages, together 5,098,914 items of mail matter. The postage collected was 646,654 francs, and the expenses were 390,363 francs.

Telegraphs.—There were in operation in 1881 100 offices, the length of line was 5,079 kilometres, and that of wire 6,816. The number of messages forwarded was 433,547. The receipts amounted to 665,036 francs, and the outlay to 949,759 francs.

Railroads.—The only lines in operation in 1883 were the 12 kilometres from Athens to the Piræus, and the 61½ kilometres from Volo to Larissa.

Commerce.—The foreign commerce in 1881 was as follows:

	Imports.	Exports.
From and to the United Kingdom	Francs. 81,810,000	Francs. 35,486,000
Turkey	17,455,000	2,618,000
Austria	24,752,000	6,717,000
Russia	10,901,000	2,009,000
France	15,155,000	11,519,000
Italy	5,802,000	3,182,000
Germany	2,885,000
Other countries	4,908,000	3,794,000
Total	109,688,000	67,710,000

The chief export articles are currants, olive-oil, goat-skins, lead, figs, gall-nuts, silk, soap, tobacco, and cotton fabrics. The exportations from Greece in 1882 and 1883 were:

DESTINATION.	1883.	1882.
To the United Kingdom (inclusive of <i>in transitu</i>)	Tons. 52,005	Tons. 50,570
To France	10,410	12,270
To the United States	8,175	8,375
To Germany, Holland, and Belgium	6,560	5,900
To Austria	1,740	1,450
To other countries	740	990
Total	79,680	79,145*

* Against 90,430 tons in 1881.

The American trade with Greece was as follows:

FISCAL YEAR.	Imports into the United States from Greece.	Exports of domestic merchandise from the United States to Greece.
1880.....	\$451,879	\$145,573
1881.....	550,688	142,042
1882.....	899,561	849,467
1883.....	1,231,580	91,017

Merchant Marine.—There were sailing under the Greek flag, in 1881, 5,180 sea-going and 6,697 coasting vessels, together 11,877 vessels, being manned by 28,034 sailors.

GREELY RELIEF EXPEDITION, THE. In accordance with the plan of the International Geographical Congress at Hamburg, in 1879, for the establishment of a series of circumpolar stations for scientific observation, Lieut. A. W. Greely, of the Fifth Cavalry, United States Army, was sent out, under instructions from the Signal-Service Bureau, to take charge of the American station at Lady Franklin bay. The point selected for this station was the most northerly and the most difficult of access of the series, being at Discovery harbor, lat. 81° 44' north, and long. 64° 45' west. Lieut. Greely received his instructions in April, 1881, and a contract was made at St. John's, Newfoundland, with the owners of the *Proteus*, a vessel that had been used for Arctic navigation, to convey his party to a point on shore from which it could reach its destination by land. His assistant, Lieut. J. B. Lockwood, and other members of the party, left Baltimore about the middle of June, to join Greely at St. John's. On the 18th of August a telegram was received announcing an auspicious beginning of the work of the station. Only a month had been occupied in the passage from Newfoundland to Lady Franklin bay, and Discovery harbor was reached on August 11th. At Littleton island the party had found letters left by English explorers, and at Life-boat Cove a transit instrument of the *Polaris*. The station was named in honor of Senator Conger, of Michigan, who had been active in promoting its establishment. In January, 1882, letters had been received from Dr. Octave Pavy, who had gone to the Arctic regions with the *Gulnare* in 1880, and had joined the Greely expedition at Godhavn. These were dated in September, 1881, and contained the last news received from the station. The following is a list of the party:

First-Lieut. A. W. Greely, Fifth Cavalry; Acting Signal-Officer and Assistant—Second-Lieut. Frederick F. Kisingbury, Eleventh Infantry; Acting Signal-Officer—Second-Lieut. James B. Lockwood, Twenty-third Infantry; Acting Signal-Officers—Sergts. Edward Israel, Winfield S. Jewell, George W. Rice, David C. Relator, Hampton S. Gardner, William H. Cross, David L. Brainerd, David Linn; Corporals and privates—Nicholas Salor, Joseph Eliot, Charles B. Henry, Maurice Connell, Jacob Bender, Francis Long, William Whistler, Henry Bierderbeck, Julius Fredericks, and William A. Ellis. Octave Pavy, M. D., of Disco, Greenland, was commissioned as

Acting Assistant Surgeon, and accompanied the expedition in that capacity.

It was arranged before Lieut. Greely's departure that in the summers of 1882 and 1883 expeditions should be sent to replenish the stores of the colony, and to afford any relief of which it might stand in need. It was understood that, if they failed to reach Lady Franklin bay, provisions and documents of instruction were to be *cached* at the farthest accessible point on the east coast of Grinnell Land, and a depot of supplies established at Littleton island. Lieut. Greely was instructed, if no relief expedition previously arrived, to abandon the station not later than September, 1883, and retreat southward by boat, following closely the east coast of Grinnell Land until he met the relieving vessel or arrived at Littleton island, where it was assumed relief would be surely awaiting him. The relief expedition of 1882 was sent out in the *Neptune*, in charge of Lieut. Beebe, and set sail in June of that year. It proved an unfavorable season; and after contending with the ice for a month, the vessel only reached the latitude of 71° 20'. Finally, stores were *cached* at Littleton island and Cape Sabine, and the *Neptune* returned.

The second relief expedition, that of 1883, was placed in charge of Lieut. E. A. Garlington, of the Seventh Cavalry, with a party of fourteen men, including a competent ice-pilot and three experienced sailors. The *Proteus* was again employed to make the trip from St. John's. She was regarded as an exceptionally staunch sailer, and was specially fitted for the service. She was 150 feet long, carried 618 tons, and had compound engines of 110 registered horse-power. Her hull was of oak, sheathed three inches thick over all parts vulnerable by ice. Her equipments and supplies were regarded as complete, and she was furnished with duplicate or triplicate appliances, such as were specially liable to injury. The *Proteus* was commanded by Capt. Richard Pike, with a crew of twenty-two men. The *Yantic*, of the United States Navy, under Commander Frank Wildes, was ordered to accompany the *Proteus*, to render all possible assistance, and to remain at Littleton island until the return of the relief expedition under Lieut. Garlington, in case it should be able to proceed to the station at Fort Conger. Lieut. Garlington received his instructions from the head of the Signal-Service Bureau at Washington. They began as follows:

You are aware of the necessity of reaching Lieut. A. W. Greely and party with the expedition of this year. This necessity can not be overestimated, as Lieut. Greely's supplies will be exhausted during the coming fall, and unless the relief-ship can reach him he will be forced, with his party, to retreat southward by land before winter sets in. Such a retreat will involve hardship and the probable abandonment of much valuable public property, with the possible loss of important records and life. For these and other reasons, which will occur to you, no effort must be spared to push the vessel through to Lady Franklin bay.

In case it should be found impracticable for the *Proteus* to make its way up Smith's sound, Garlington was instructed to retreat from his advanced position, land his party and stores at Life-boat Cove, discharge the relief-vessel with orders to return to St. John's, and prepare to remain until relieved the following summer. He was then as speedily as possible to endeavor to communicate with Lieut. Greely by means of a sledge expedition under his own personal charge. Such stores were to be left at Cape Sabine as it was practicable to leave there, and thence a smaller party, still under Garlington's personal charge, was to push on as far as possible, or until Greely was met. With regard to the *Yantic*, it was stated in the instructions that it would accompany the expedition to Littleton island, rendering such aid as might become necessary and as might be "determined by the captain of that ship" and Lieut. Garlington when on the spot.

The *Proteus* left St. John's on the 29th of June. On the 18th of September the Secretary of the Navy received a dispatch from the same place, signed by Commander Wildes, and announcing the return there of the *Yantic*, bringing Capt. Pike and crew of the *Proteus* and Lieut. Garlington and the Greely relief party, with a brief statement of the failure of the expedition. The facts, as subsequently brought out, showed that the *Proteus* had arrived at Godhaven, Greenland, on the 6th of July. The *Yantic* did not reach the latter point until the 12th. Lieut. Garlington found that the Danish authorities there had received no instructions in regard to assistance for the expedition, and the skin-clothing and dog-drivers expected were not in readiness. Procuring such supplies as could be obtained on short notice, and taking on board the stores left at Godhaven the previous summer, the *Proteus* proceeded on the 16th to Disco Fiord, where an Esquimau driver was expected. Near that place the vessel ran aground, but was got off without serious injury. On the 19th she brought up against a solid ice-floe, beyond which one of the islands of the Bel-gone group was sighted. On the 20th Cape York came in view, and the day following the ship passed to leeward of D. E. Carey island and lay there while Lieut. Garlington landed and examined the depot of provisions left by the Nares expedition in 1875, which he found in fairly good condition. Taking copies of the records found there, he proceeded and rounded Cape Alexander and entered Pandora harbor on the morning of the 22d. The weather was delightful, and no ice was to be seen to the northwest. Garlington therefore decided to push on without stopping at Littleton island, and to make his first *caché* of provisions at Cape Prescott. Before noon, however, he encountered the edge of a pack of ice apparently extending across the sound. While waiting for an opening, he landed and examined the *caché* of provisions at Cape Sabine, which

he found in good condition, except that the tarpaulin covering had been torn by bears, and the boats were badly scratched. Later in the afternoon narrow lanes opened in the ice on the western side of the sound, and the *Proteus* worked her way slowly and with frequent ramming, until the morning of the 28d, when she was within four miles of Cape Albert. The pack had then closed, and an effort was made to work the vessel back to open water in the vicinity of Cape Sabine. At 2.45 P. M. the vessel came to a stand-still within 400 feet of open water, and the ice-pack closed heavily in upon her, smashing the starboard rail, forcing up the deck-planks, and breaking through into the starboard coal-bunkers. The stores on deck and near at hand were hastily thrown over on the ice, but the vessel filled and threatened to sink before the task of getting out her supplies was nearly completed. Two whale-boats and a dinghy were got out, the chronometers, sextants, and records were secured, and at 6.50 P. M. the vessel was abandoned, Lieut. Colwell being the last to leave her, and twenty-five minutes later she sank. A part of the stores were with great difficulty transported to Cape Sabine, and a deposit of 500 rations for Lieut. Greely was made three miles west of that point. Before the stores were all secured, the floe had moved off, so that the remainder could not be obtained.

Lieut. Garlington then decided that it would be impossible to proceed northward with the small boats. He did not believe the *Yantic* would attempt to cross Melville bay, but, in case she did so, she would find a record of the disaster at Littleton island, and know what course to take. Garlington therefore determined to cross Smith's sound and make his way down the Greenland coast to Upernavik. At Cape York he opened communication with a party of Esquimaux, and learned that nothing had been seen of the Swedish vessel *Sophia*, which he somewhat expected to encounter. He sent Lieut. Colwell with a lightly loaded boat directly across the bay to Upernavik, while with the rest of the party he made his way around by the trend of the coast. At Browne's island he picked up a record left there in a cairn thirty-five years before by Sir John Ross, and on the 28d of August reached Cape Shackleton, where he met a party of Esquimaux sent to his relief by Commander Wildes, of the *Yantic*. Ten days later all the survivors of the expedition were gathered upon the *Yantic* at Upernavik, whence the return was made to St. John's. The *Yantic* had reached Littleton island on the 8d of August, and, finding Garlington's records, had proceeded southward again, searching the coast and islands until Saunders islands were reached. There the ice-pack closed about the vessel, and it was forced to retreat under the lee of Northumberland island. On August 9th the pack had loosened, and the vessel made its way through, but could not get near the coast. It therefore

proceeded to Upernavik and sent a whale-boat to Cape Shackleton. August 22d she reached Godhaven, where Lieut. Colwell arrived on the 31st, having been thirty-nine days in an open boat. Reaching Upernavik, the Yantic found the whole party, and on the 2d of September set sail for St. John's.

The failure of the expedition was the cause of wide-spread regret, and much criticism was passed upon its conduct. No authentic information had been obtained of the Greely party. An Esquimaux story had been picked up by the Yantic at Danish harbor, to the effect that Dr. Pavy had died, but that the rest of the party were well. Another Esquimaux report was, that the officers had been murdered by their men, but no credence was given to these stories. The worst aspect of the case was, that no substantial relief had in two years been afforded to Lieut. Greely, and there were grave doubts as to whether he could survive another winter at Lady Franklin bay, or succeed in reaching succor if he left there in pursuance of his instructions, without finding the expected supplies on his way.

Lieut. Garlington was severely criticised for not leaving his stores at Littleton island on his way northward, and Gen. Hazen, chief officer of the Signal-Service Bureau, declared that Garlington had received supplemental orders, just before sailing, to the following effect:

The naval tender is to join the Proteus at St. John's, Newfoundland, and to proceed with her to the neighborhood of Littleton island. The Proteus is to land her stores, except supplies for more northerly stations, at Littleton island on her way north. If she succeeds in reaching Lady Franklin bay she is to pick up the stores, excepting the house and depots, if possible, on her return. The naval tender will await the return of the Proteus at the neighborhood of Littleton island, and on her return steam to the south in her company until she reaches the southern limits of the ice-pack, when the vessels may separate. Should the Proteus be crushed in the ice, her crew will retire on Littleton island, and the tender will bring to St. John's, Newfoundland, the officers and crew of the Proteus, the rest of the party to remain at Littleton island. But should the ice render it dangerous for the tender to remain in the neighborhood of Littleton island until the Proteus returns, or her crew and the expeditionary force succeed in reaching there, the tender may go to the south, leaving full particulars at Littleton island. Signals by flags, heliograph, and guns should be preconcerted, and communication by this means should be maintained between the two vessels as long as possible after they are separated by the passage north of the Proteus. Nothing in the northward movement must be allowed to retard the progress of the Proteus. It is of the utmost importance that she take advantage of every lead to get up to Lady Franklin bay.

Lieut. Garlington, in his own report to the Signal-Service Office, reflected severely upon Capt. Pike and his crew. He said that the Proteus had run past the harbor of Godhaven in consequence of that officer's ignorance of its proximity; that the grounding of the vessel at Disco Fiord was owing to his negligence in not taking soundings; and that when the vessel was "nipped" in the ice above Cape Sabine his crew was unmanageable and stole supplies

belonging to his (Garlington's) party. "Force would have been needed," he said, "to compel the observance of the disciplinary regulations necessary to a successful retreat from our perilous position, and more force than I had at my command. I determined, therefore, to keep my men and stores separate and distinct, avoiding, if possible, any unnecessary collision." With regard to the alleged supplemental orders, and the criticism upon his course, Lieut. Garlington said:

I desire to call your attention to the manifest injury done me in the publication of certain statements immediately after the news of the disaster reached here. These statements, purporting to have been authorized from the Signal-Office, were to the effect that I had been furnished with "supplementary instructions" prior to my departure from the United States, which instructions I had positively disobeyed. The only instructions I ever received are the original instructions published at the time. An unsigned written paper was inclosed in the envelope with my instructions. This paper is simply an unauthenticated copy of a memorandum prepared by an officer in your office. I was informed that this memorandum was to have been furnished the Secretary of the Navy, to form the basis of instructions to be given the commander of the vessel ordered to accompany the Proteus. The paper was not addressed or signed. Indeed, it bore no official marks whatever. I have never at any time regarded it as an order, and I was surprised to find the statement published that this paper was the supplementary instructions. When I found it among the papers furnished me, I at once carried it to you and called your attention specially to that clause relating to landing supplies on Littleton island. You said, in substance, you did not know how that had gotten in there, and impressed upon me the necessity of carrying out as far as possible the instructions I had received. These instructions were based upon the letter of Lieut. Greely, and you called my attention to the fact that Lieut. Greely strongly urged that the officer commanding the relief party should have "no latitude of action." The paper was not addressed nor signed; indeed, bore no official marks whatever. I did not then, nor have I at any time since, regarded it as an order, and I was surprised to find the statement published that this paper was the "supplementary instructions."

On the 10th of October the Secretary of the Navy addressed to Commander Wildes, of the Yantic, some inquiries as to his failure to co-operate more efficiently with the Proteus. He said:

Your instructions, under the date of June 9th, were to "proceed to the northward, through Davis straits, in company with the steamer Proteus, if practicable," but not to go beyond Littleton island. It appears that the Yantic and Proteus were together at Disco island on July 15th, when the Proteus sailed northward; but that the Yantic did not finally leave that island until July 20th; the Proteus reached Carey island July 26th; the Yantic not until August 2d; the Proteus passed Littleton island July 22d, and was crushed in the ice July 23d; the Yantic did not reach Littleton island until August 3d. Between July 23d and August 3d, namely, on July 26th and 28th, Lieut. Garlington and the whole party of the Proteus had come to Littleton island and Pandora harbor, and not finding the Yantic, had continued to the south in open boats in search of her, notwithstanding the orders of the War Department, given for such a contingency, to land with their stores at or near Life-boat Cove, in Littleton island, and to prepare for remaining until next year. Had the Yantic, however, been at Littleton island July 29th, instead of being twelve days be-

hind the Proteus, Lieut. Garlington's relief party would have remained at that point, with ample supplies, keeping "their telescopes on Cape Sabine and the land to the northward," and waiting for Lieut. Greely, whose orders required him to endeavor to reach that vicinity not later than September, 1883, and who would not then have found awaiting him, as is now the case, if he has successfully obeyed his orders, neither house nor provisions, but only the record of the complete failure of the mission of the Proteus and the Yantic. . . . Your attention is also called to another point. You had been furnished with copies of the instructions to Lieut. Garlington and were aware that he was ordered, in the event of the failure of the Proteus, to reach Lady Franklin bay, to establish the relief station at Littleton island, and that Lieut. Greely would endeavor to reach that point in September, expecting there to find a relief party, a house, food, and provisions. You were at Littleton island on August 2d, and learned that the Proteus had been crushed, and that Lieut. Garlington and his whole party had gone south, leaving nothing for Greely at Littleton island. You could have readily landed there provisions and supplies, but omitted to do so. You will please explain this omission, and will furnish the department a schedule in detail of the provisions of all kinds which you then had on board the Yantic, and a similar schedule of those you had on hand when you arrived at St. John's on September 18th. In the instructions of the War Department to Lieut. Garlington, dated June 4, 1883, is the following clause: "A ship of the United States Navy, the Yantic, will accompany you as far as Littleton island, rendering you such aid as may become necessary and as may be determined by the captain of that ship and yourself when on the spot." You will inform the department whether or not you had knowledge of this clause. Inclosed you will also find a copy of a memorandum marked "Inclosure 4," containing instructions for the guidance of the naval tender and the Proteus, and you will inform the department whether, during your voyage, these or any such instructions were seen by you, or were only communicated to you.

In his reply, dated Oct. 16th, Commander Wildes explained that the Yantic was forced, on account of the condition of her boilers, to go from St. John's to Greenland under sail, and to take an easterly course to avoid the ice of the Labrador coast, while the Proteus steamed directly for Godhaven. He said:

No time was lost, and no unnecessary delay was made at any point. The Proteus, carrying a large supply of coal, and steaming at full speed, had only to delay to obtain the stores left at Godhaven last year, and a native dog-driver from Disco Fiord. She then went north without stopping. Had I sailed from Godhaven at the same time as the Proteus, besides being unable to keep up with her, I should have arrived at Littleton island, 1,000 miles distant, with my coal-supply reduced to about 75 tons and the boilers in a leaky, precarious condition. This is without taking into account any detention from thick weather or ice, which can not be counted on, as the normal condition of this region appears to be fog.

After explaining the dangers and difficulties of Melville bay, he added:

In view of these facts I should have felt justified in delaying to a still later date the attempt to cross Melville bay, or even not making the attempt at all. But I did not delay one moment after I considered my ship prepared and the weather had cleared, but pushed across to Cape York, feeling certain from the thick, foggy weather, raw, chilly air, flumes of snow and smooth sea, that the middle pack was not far distant. Pandora harbor was reached six days after the boats had gone south. To conclude this part, I did not intend to run the vessel under my command in the hap-haz-

ard, happy-go-lucky fashion which finally brought the Proteus to grief, but to make sure, so far as possible, of every step which I took. Had the Proteus been ordered to keep company with the Yantic, it would have been vastly better for all concerned.

Regarding the so-called supplemental instruction, spoken of as "Inclosure No. 4," Commander Wildes declared that he never heard of it until his arrival at St. John's on the return trip. In conclusion, he expressed his willingness to shoulder all the responsibility that belonged to him, and asked, in case there was any doubt that he had performed his full duty, that a court of inquiry be ordered to investigate his conduct.

Lieut. Garlington's report not being wholly satisfactory to the Signal-Service Bureau and the War Department, a series of questions were addressed to him, replies to which were received on the 24th of October. In these he explained more fully why he failed to establish a depot of supplies at Littleton island and to remain in that region for the arrival of the Yantic, which he was convinced would not be able to make her way through the ice-pack of Melville bay. He also explained why he was obliged to leave a portion of the supplies of the Proteus on the ice-floe, and was unable to leave any boats for the use of Lieut. Greely. In answer to the question why he did not remain north of Cape York with his party, he said:

I did not remain at Cape York because I did not see then, nor do I see now, how I could possibly have been of any service to Lieut. Greely. From the best information attainable I am of the opinion that there are no more than 125 Esquimaux from Cape York to Rensselaer bay, and it is a well-known fact that they are a very improvident and shiftless race, and on the verge of starvation every winter. To have quartered a party, however small, without provisions, on these people, with the chance of Lieut. Greely reaching there with his party during the fall, would have been but to seriously endanger the lives of the whole community, without being able to accomplish any good whatever. I had not more than two weeks' supplies when I left Cape York. I left that point for the same reason I left Cape Sabine—to endeavor to help Lieut. Greely in the only way it seemed to me practicable.

In conclusion, he also asked for a court of inquiry if his explanation of his conduct was not satisfactory.

After these explanations had been made, the Secretary of War addressed a letter to the Chief Signal-Officer, in which he sharply criticised the entire management of the relief expedition. He thought that two serious omissions had been made which contributed to its failure. In the first place, Lieut. Garlington should have established a base of supplies at Littleton island on his way northward, and in this connection the Secretary made some pointed references to the careless manner in which the memorandum known as "Inclosure No. 4" had been dealt with. It had been inclosed in the instructions without clearly being made part of them. The other important omission was the failure of the Proteus and the Yantic to keep together, which had not been satisfac-

torily explained. Secretary Lincoln was also of opinion that Lieut. Garlington should have remained at or near Littleton island. The case was submitted to the President, with recommendation that a court of inquiry be ordered. The order to that effect was issued Oct. 31st, and the court, consisting of Brig.-Gen. S. V. Benet, Chief of Ordnance; Col. R. B. Ayres, Second Artillery; and Lieut.-Col. O. M. Poe, of the Corps of Engineers, met on the 8th of November. Maj. Henry Goodfellow, Judge Advocate of the United States Army, acted as recorder. No further action was taken with reference to the conduct of Commander Wildes, of the Yantic.

Testimony before the court of inquiry occupied several weeks. Lieut. Garlington and Lieut. Colwell testified regarding the conduct of the expedition, and repeated the criticism upon the action of Capt. Pike and his crew. Capt. Pike gave evidence as to the condition of his vessel, his own experience, and the character of his crew. Commander Wildes was examined with reference to the part taken by the Yantic. Gen. William B. Hazen, head of the Signal-Service Bureau, testified in regard to the preparation for the expedition, the employment of the Proteus, and the instructions furnished to Lieut. Garlington. Secretary Chandler gave an explanation of the outfit of the Yantic and the instructions under which she was sent out, and other witnesses were examined at length. Argument by counsel was begun on the 3d of January, 1884, and Gen. Hazen read a paper in defense of his own course regarding the relief expedition.

The report of the court of inquiry was withheld from publication until drawn out by a resolution from the Senate in February, 1884. It embodied a digest of the testimony taken and the conclusions reached. While declaring that Lieut. Garlington had erred in not waiting longer at Pandora harbor with the object of obtaining from the Yantic supplies with which to make a depot for a winter station at Life-boat point or Littleton island, the court regarded this as an error of judgment "committed in the exercise of a difficult and unusual discretion," for which he "should not be held to further accountability." His general conduct of the expedition was commended as characterized by "zeal, energy, and efficiency," both before and after the loss of the Proteus. The failure of the expedition was attributed to the "grave errors and omissions" of the Chief Signal Officer of the army.

Various opinions had been given as to the situation and prospects of Lieut. Greely. Garlington, in his report, had said:

I am of the opinion that if Lieut. Greely should reach Littleton island this season he will divide his people among the different Esquimau settlements, and the stores he will find on his line of retreat, supplemented by the game of that region, will be sufficient food for his party during the coming winter. Unless the conditions of the ice permit Lieut. Greely to leave Discovery harbor in his boats, I do not think

he will attempt the journey to Littleton island this season. He has at Discovery harbor a good house, plenty of fuel and provisions, with what game the country affords, to carry him to next spring. He could then start south as early as the state of the season permitted, and reach Cape Sabine without much comparative difficulty. This will, in my opinion, be the course adopted by Lieut. Greely.

Commander Wildes, in his letter to the Secretary of the Navy, said:

I had no fears for Lieut. Greely, who, living in a region reported well stocked with game, has economized his provisions. Should he reach Littleton bay, besides the provisions on the west coast, the rocks and waters between that island and the mainland abound with walrus, the stench from their ordure fouling the air for a long distance. On the neighboring mainland reindeer are reported numerous. On the southeast of Carey island there is a cache of six months' provisions for twenty men, known to Lieut. Greely, who landed there. They would have to live Esquimau-fashion, but Dr. Kane and Lieut. Schwatka did that.

Immediately on the announcement of the failure of the expedition, the question of a third effort to relieve Lieut. Greely began to be discussed. It was decided that another spring would have to be awaited before any practical steps could be taken, but in the mean time it was determined to appoint a commission to take the matter into consideration and supervise all the preparations for the expedition of 1884. This commission was appointed by the President on the 17th of December, and consisted of Gen. William B. Hazen, Chief of the Signal-Service Bureau, and Capt. George W. Davis, of the Fourteenth Infantry, selected by the Secretary of War; and Capt. James A. Greer, of the United States Navy, who had commanded the Tigress on the search for the Polaris survivors, and Lieut.-Commander B. H. McCalla, designated by the Secretary of the Navy. This commission, at the beginning of 1884, began receiving suggestions and plans regarding the new expedition for the relief of Lieut. Greely and his party.

GREEN, John Richard, an English historian, born in Oxford in 1837; died at Mentone, France, March 9, 1888. He was a child of small and feeble frame, unable to partake in the usual sports of boys, and was shut up to the companionship of his books. His early education was received at Magdalen College School; and at the age of fifteen he had mastered all that could there be taught him. He then studied for three years under private tutors, and at eighteen obtained a scholarship in Jesus College, Oxford. The regular collegiate course presented few attractions to him, and he made no effort to attain any of its honors, devoting his time mainly to historical reading. While an undergraduate, he contributed to the "Oxford Chronicle" a series of papers upon "Oxford in the Eighteenth Century," which attracted the notice of the late Arthur Penrhyn Stanley, then Regius Professor of Ecclesiastical History at Oxford. These papers, which were subsequently reprinted, gave promise of the high and rare powers to be developed in those works which won for him a foremost place

among modern English historians. He took his degree in 1860, received holy orders, and through the influence of Stanley was made curate of St. Barnabas's, a poor and populous parish in an eastern district of London, dividing his time between parochial duties and historical studies in the British Museum.

In 1862 he was presented to the vicarage of St. Stephen's, Stepney, a post which he retained until 1869. His labors here were immense. He not only brought his parish into a high state of efficiency, but also carried his historical studies to the remotest sources, some of his favorite works being the huge folios of the Bollandist "Acta Sanctorum." Nothing, however, came amiss to him. He had acquired a facility for rapid reading, and possessed that poetic imagination which enabled him to grasp the vital characteristics of a past epoch, and the corresponding faculty of combining these features into a consistent whole. The results of his studies became more apparent in numerous historical essays which appeared in the weekly newspapers; and it grew clear to him that his true vocation was not a clerical one, for which indeed his feeble health unfitted him. He resigned his living, and the Archbishop of Canterbury appointed him librarian at Lambeth. He undertook no further clerical work, and, as his duties as librarian were little more than nominal, he was able to set himself seriously at work as an historian.

His first formal work in this capacity was the "Short History of the English People," the success of which was immediate. It made its way solely by its own merits, for the closely-printed, thick little volume had no external attractions for the general reader, to whom the very name of the author was new. But competent critics were not slow to make its merits known. Prof. Edward A. Freeman wrote of it: "The object of the book—that of combining the history of the people with the history of the kingdom—is most successfully carried out. It displays throughout a firm hold on the subject, and a singularly wide range of thought and sympathy. As a composition it is clear, forcible, and brilliant. It is the most truly original book of the kind that I ever saw." Another reviewer averred that this "Short History" contained "an amount of knowledge which would have sufficed to furnish forth a stately library-work in eight or ten volumes, together with a comprehensiveness of view, a novelty of method, and a power of bringing together all the scattered elements of history, with a freshness of style of which no historian since Macaulay had given an example." In Great Britain nearly 100,000 copies have been sold, and it is hardly less popular in the United States.

In 1870, after a severe illness, Mr. Green was ordered to a southern climate by his physician, and these "winter fittings," to which he owed the prolongation of his life for a dozen years, were annually repeated, giving occasion to

many pleasant papers, which have been collected into a volume entitled "Stray Studies from England and Italy."

The history was published when the author had just reached the age of thirty-seven. He himself was sensible that he had only begun to execute the task which it lay in him to perform, should a few more years be added to his frail tenure of life. He at once set himself to the task of writing an ample work upon the same general lines, and with a like scope, but essentially modified in form and manner. The first volume of the "History of the English People" appeared in 1877, and the fourth volume, bringing the history down to the final overthrow of Napoleon at Waterloo, was concluded in 1880. Of the first volume the London "Saturday Review" said: "Three years ago Mr. Green achieved a brilliant success. He had the rare fortune to write a book that everybody read; scholars acknowledged his learning, his breadth of view, and his grasp of his subject; all owned his narrative power and charm of style. The 'History of the English People' no longer wears the modest guise of a school-book, but has become one of stately appearance. Though the materials of the earlier book have been worked into it, and though we recognize many of the most brilliant passages as old friends, still the arrangement is so altered, and the amount of fresh matter is so large, that it is substantially a new work, which, while retaining the life and sparkle of its predecessor, is better proportioned, calmer in tone, and altogether a more ripe and complete piece of work."

In 1877 Mr. Green married the daughter of Archdeacon Stopford, with whom he wrote a "Short Geography of the British Isles," and not long afterward projected a very successful series of "History and Literature Primers," edited by himself, but written by several eminent English scholars. In the mean while his high merits began to receive recognition. He was elected a member of the Athenæum Club; Jesus College, where he had graduated, made him an honorary fellow; the University of Edinburgh conferred upon him the degree of LL. D.; and he was chosen an examiner in the School of Modern History at Oxford. He found time to compile a selection of "Readings from English History," so arranged as to illustrate the great periods from the Saxon conquest to the battle of Crecy, from Crecy to the time of Oliver Cromwell, and from Cromwell to the Crimean War, connected by appropriate threads of remark and explanation necessary to illustrate the series of events. The three parts have been brought together in this country in one moderate volume.

For several years, Mr. Green had usually passed the winters at Capri, in Italy; but in 1880 he went to Egypt. The change was unfortunate: the climate was not favorable; he caught a severe cold on his return voyage, and was very ill during the summer of 1881. In

the autumn he betook himself to Mentone, where he seemed to have taken a new lease of life. He wrought with unflagging industry upon "The Making of England," a work which in the judgment of scholars is his masterpiece. The period of the Saxon Heptarchy has been dismissed by other historians as a time marked by events no more worthy of record than the obscure "fightings of kites and crows"; but Mr. Green's studies had wrought in him a firm conviction that in those dim ages were planted the seeds of English character and of English history; that the fierce struggles of the Heptarchy were in truth "the birth-throes of national life." His theory is, that the Celtic races whom Cæsar found in Britain were exterminated by the successive tides of the Teutonic invaders. A contrary theory is, that they were not exterminated, or even driven off, but were amalgamated with and absorbed into the newcomers. In either case the fact remains unquestionable that the Celts, as a race, vanished from the southern portion of the island, and the civil institutions grew up to be not Celtic, but Anglican or English. A people was born then and there who have not only held the land of their development, but have spread themselves as a distinctive race over new worlds. In that ante-Norman period was the "making" not merely of England but of North America and of the colonies, in time to become nations, of Australia and New Zealand. In the development of this idea the author has put forth the highest qualities of the historian. In nothing is the special value of the work more marked than in the descriptions of the physical features of the England of the Heptarchy. The first volume of the "Making of England" was published barely a year before the author's death. Its high value was at once recognized, and it was immediately republished in New York; his work being as highly appreciated in America as in his own country. By incessant work, he just succeeded in finishing, before his death, a volume entitled "The Conquest of England," which was published posthumously, and forms, properly, a sequel to his "Making of England."

Mr. Green was no mere recluse student, but took an eager interest in all the great social, political, and literary questions of the day. There seemed to be no limit to his versatility, and his conversation was as brilliant as his writing. The pleasant house in Kensington square, which was his London home during the summer months of several years, was the resort of men who are eminent in public affairs, and in art and letters.

GUATEMALA, a republic of Central America. Area, 121,140 square kilometres; population, 1,252,497. The President is Rufino Barrios, elected May 9, 1878, since which time his term of office has been prolonged by decree of the Constitutional Assembly, Oct. 23, 1876, and he was re-elected March 15, 1880, for six years. The Cabinet is composed of the fol-

THE PLAZA, QUEZALTENANGO.

lowing ministers: Foreign Affairs, Dr. F. Cruz; Interior, Dr. C. Diaz Mérida; War, Gen. J. M. Barrundia; Public Instruction, Señor D. Sanchez; Agriculture and Public Credit, in charge of the sub-Secretary of State, Dr. R. A. Salazar; Public Works, Señor M. Herrera.

The Envoy Extraordinary and Minister Plenipotentiary to the United States is Señor L. A. Bâtes, and the Consul-General at New York is Señor J. Baiz.

The United States Minister Plenipotentiary to the five Central American Republics (resident in Guatemala) is Hon. H. C. Hall, and the United States Consul at Guatemala City, Dr. F. H. Titus.

FINANCES.—The amounts and the various branches of the national revenue and expenditures for the fiscal year 1882 were as shown in the table below:

REVENUE.	
Balance from former years.....	\$165,590
Real-estate tax.....	108,856
Money collected for release from military service.....	18,925
Turnpike-tolls.....	34,581
Sundries.....	4,188
Import duties.....	1,698,470
Export duties.....	66,053
Tonnage dues.....	8,900
Stamp-tax.....	114,223
Slaughter-house tax.....	99,965
Milling-tax.....	47,196
Salt-tax.....	27,455
Tax on inheritances and donations.....	11,514
Patent-tax.....	58,580
Tax on spirits, tobacco, saltpeter, and powder.....	1,636,280
Special state revenues.....	360,905
Sundry collections.....	135,457
Loans and deposits.....	2,190,088
Total.....	\$6,607,679

EXPENDITURE.

National debt (foreign branch)*	3,466,019
Total	\$6,487,069

Railroads.—The first line of railway that went into operation in Guatemala was the one from San José to Escuintla, 23 kilometres, opened June 13, 1880. Other lines are being built, from Escuintla to Guatemala, and from Champerico to Retalhulen.

Champerico a few years ago was almost an unknown port. Now it has a fine iron mole, and every Pacific Mail coasting steamship calls there to receive or discharge the many thousand tons of cargo which constitute the life of the Costa Grande, Costa Cuca, and Retalhulen districts. A few years have entirely changed the aspect of affairs, and more capital being invested every day in agriculture, cheap and easy transport has become a necessity. To supply this a company was formed in San Francisco, called the "Champerico and Northern Transportation Company of Guatemala," and its first effort is to establish rail communication between Champerico and Retalhulen, *via* Caballo Blanco in the vicinity of the Costa Cuca, the most productive coffee district in Guatemala.

Telegraphs.—There was a length of lines in operation in 1882 of 3,114 kilometres, served by 63 offices, the number of messages sent during that year being 219,744. The receipts were \$56,989, and the expenses \$68,924.

Postal Service.—In 1882 there passed through the mails forwarded 280,123 private letters, 61,724 Government dispatches, 50,807 letters sent and delivered in cities, 8,406 registered, 291,893 newspapers, 644 sample packages, 250 other packages—total items of mail matter, 693,847; received, 706,196—total, 1,400,043,

against 1,039,652 in 1881. Receipts, \$56,989; expenses, \$68,924.

Commerce.—There entered and left Guatemalan ports, in 1882, 168 steamers and 62 sailing-vessels—together, 230.

IMPORTS.			
1877	\$3,184,000	1880	\$3,647,000
1878	3,238,000	1881	3,665,000

pal is a strong prejudice against Americans and their goods. Nearly all of the importers are foreigners, mostly Germans; and of the professed American houses only one or two of any importance are conducted by native Americans; the rest, chiefly by naturalized Germans. The majority of the importing establishments are branches of European houses, or have European connections in some way.

Cinchona-Bark.—The Republic of Guatemala has arranged with a well-known Ceylon planter to select seeds for 5,000,000 cinchona-trees. Central America has been explored for a thousand miles to determine the best sites for planting these; and the rapid increase in the number of uses to which cinchona-bark is put, not only for the manufacture of quinine and as an ingredient in the substitute for hops, but also for commercial purposes, has led Pres-

* Of which Federal debt, \$672,714; other debts, \$2,793,305.

the autumn he betook himself to Mentone, where he seemed to have taken a new lease of life. He wrought with unflinching industry upon "The Making of England," a work which in the judgment of scholars is his masterpiece. The period of the Saxon Heptarchy dismissed by other historians as a time of events no more worthy of record than obscure "fightings of kites and crows"; but Mr. Green's studies have wrought in him a firm conviction that in those ages were planted the seeds of English character and of English history; that the struggles of the nation were in truth the throes of national theory is, that whom Cæsar were external and successive invaders is, that but and civil war.

The public debt amounted in May, 1882, to \$12,507,884, of which the remainder due France under the arrangement of 1825 constituted \$307,884; the Dominique loan, \$7,200,000; and the internal debt, \$5,000,000.

During the late insurrection the Haytian National Assembly authorized the Government to borrow \$1,000,000 from the National Bank of Hayti and issue paper money to an equal amount, to be a legal tender for three years; this loan to be refunded by means of additional taxes to be levied under provisions of a special law to that effect passed on Aug. 28, 1883.

Since 1873 American silver has constituted the principal part of the circulating medium of Hayti; but between 1880 and 1882 a large amount of Mexican silver dollars has been imported, and this money has circulated freely. Within the same period an amount of Haytian coins, bearing the effigies of Boyer and Pétion, variously estimated at from \$50,000 to \$100,000, has been remonetized and again been put in circulation. If to these several elements of silver money be added a small amount of American, English, French, and Spanish gold, the aggregate of the whole, both kinds of specie, amounting to about \$7,000,000, we will have, substantially, the sum total and character of the currency which has been employed in Hayti for the period indicated.

It was in this monetary condition of the country, on the election of Gen. Salomon to the presidency, that the proposition to establish a national bank, with foreign capital and by grant of a special concession, was considered and determined by the Haytian National Assembly.

The upshot of the matter is presented in a contract with the Parisian General Industrial and Commercial Credit Company for the establishment of such institution for fifty years. The bank founded under the auspices of this society is a joint-stock company, with its headquarters at Paris. The capital consists of 10,000,000 francs, or \$2,000,000. It has the exclusive privilege of emitting bills which shall pass current throughout the country, provided that the amount of such bills shall not exceed

In 1844 Hayti separated from Santo Domingo, the eastern, Spanish-speaking portion of the island, which has since then maintained its independence, with the exception of a short interval during the American civil war, when it formed part of the dominions of Spain. In 1846, under the new Constitution, which went into existence on November 14th of that year, a sort of ostracism was decreed against the whites, by virtue of Article VII of that document, which stipulates that "no white man, to whatever nation he may belong, is allowed to reside in Haytian territory as master or property-holder, and he is forbidden from ever acquiring real estate or Haytian citizenship."

Finance.—The budget for 1882-'83 made the following estimate of expenditures:

ble its metallic reserve, and that they be
 med on presentation at the bank at Port-
 uce or at its branches in Hayti.

Army.—The active army, on a peace
 consists of one battalion of artillery,
 g; one regiment of foot, 200 men;
 atalion of "chasseurs à pied," 150; one
 adron of cavalry, 100 horse—these troops
 orming the guard; furthermore, those consti-
 tuting the line, belonging to which there are
 four battalions of artillery, 1,000 strong; six
 regiments of foot, 3,200; and 46 companies of
 "gendarmes"; this places the numerical force
 of the army at 6,828 men, kept up in part by
 conscription for a seven years' term of service,
 and partly by volunteers serving four years.

The Haytian navy consists of one steam
 man-of-war.

The Insurrection.—With the fall of Miragoane,
 on Jan. 10, 1884, one of the most stubborn of
 the insurrections that from time to time dis-
 tress the Republic of Hayti came to an end.
 The three towns held by the insurgents were
 Jérémie, Jacmel, and Miragoane, on the coasts
 of the long peninsula in the southern part of
 the island. Jérémie was the first to surrender,
 Dec. 24, 1883, after a bloody combat; Jacmel
 followed its example on December 29th; and
 with the yielding of the third port, a revolt
 which has cost hundreds of lives and mill-
 ions of money, and which at one time threat-
 ened to develop into a race-massacre, was
 crushed on the spot of its origin. Apart from
 the commercial interests of the United States
 in this event, the rebellion derived importance
 for us from the fact that it was set on foot by
 an armed expedition starting from this coun-
 try as a base. Boyer Bazelais and his followers,
 who landed at Miragoane on the night of March
 29, 1883, there surprising the garrison and cap-
 turing the fort, had been conveyed thither by
 an American fruiterer, the steamer *Tropic*.
 This vessel had left Philadelphia with a secret
 cargo of arms, uniforms, and munitions, and
 had been boarded at the island of Inagua by
 Bazelais and his followers, who immediately
 put on the uniforms and drilled with the guns.
 The complicity of the *Tropic's* officers in this
 violation of the neutrality laws was formally
 established by a United States court, which
 sentenced them to fine and imprisonment.

Not long after the *Tropic's* expedition, the
 Mary N. Hogan was seized by the United
 States Government, on suspicion that she was
 about to violate the neutrality laws in the
 interest of the Haytian insurgents; and dur-
 ing the latter part of November she was con-
 demned. A little later the schooner *E. G.*
Erwin was detained on the same ground. Sub-
 sequently the *Azelda* and *Laura*, sailing under
 the American flag, was promptly detained, at
 the request of the Haytian consul-general.

While the three ports named were occupied
 by the insurgents, and the Haytian Govern-
 ment forces by land and sea operating against
 them, President Salomon issued a decree passed

by the National Assembly of Hayti, amending
 Article XXXI of the Constitution, whereby
 trials by jury during the rebellion were sus-
 pended for the crimes of forgery, counterfeit-
 ing, incendiarism, and such as are of a political
 nature; a law repealing the import duty on
 Mexican coin; a law opening to foreign com-
 merce the ports of L'Anse d'Hainault and
 Dame-Marie, on the south end of the island;
 a law closing to foreign commerce the ports
 of Jacmel, Jérémie, and Miragoane, and a
 proclamation announcing the crime committed
 by the insurgents at Jacmel in murdering in
 cold blood fourteen political prisoners, civil
 and military. After being defeated by the
 Government troops in an engagement on Au-
 gust 3d, the insurgents retreated to the city,
 and before the Government troops arrived,
 assassinated the most influential Government
 officers whom they had in their power, be-
 cause on July 23d these officers had refused
 to betray the Government of the republic and
 join the rebellion. While President Salomon
 was thenceforward straining every nerve to
 quell the insurrection through a more system-
 atic and powerful display of military and
 naval resources, a most deplorable incident
 occurred at the capital, Port-au-Prince, on
 September 22d, in the shape of a rising against
 his authority, accompanied by terrible excesses.
 The cause of it seems to have been that the
 local authorities endeavored to arrest two
 young men known to be hostile to the Gov-
 ernment. The insurgents began by attacking
 at 11 A. M. the residence of the general com-
 manding the troops of the district, and shot
 him on the spot. The garrison then retreated
 to the presidential palace, outside of the city
 gates; and the insurgents, thus finding them-
 selves at liberty to do as they pleased, and
 wreak their vengeful feelings on other in-
 habitants whom they considered their enemies,
 fired on all such, causing a general stampede,
 until at 6 P. M., when, after three hours' fight-
 ing, President Salomon succeeded in dispers-
 ing the assassins, who sought refuge in the
 consulates. At this juncture the President had
 lost control of his own troops, who, in common
 with the rabble, set fire to the town and
 plundered in all directions during the confu-
 sion. The British war-steamer *Fantom* landed
 a crew to protect the consulate, which the
 mob threatened to burn down. These dreadful
 scenes were prolonged till the afternoon of
 September 28d, when foreign ministers and
 consuls united in a protest, threatening the
 city and palace with bombardment by the
 men-of-war in the harbor, if order were not
 restored immediately; and the city became
 tranquil once more. The losses sustained by
 foreign merchants, notably French, by fire,
 were considerable, and in November the Hay-
 tian Government was informed that an in-
 demnity would be exacted.

Toward the close of October President Sal-
 omon issued another proclamation, in which

he announced that the leader of the rebellion, Boyer Bazalais, had poisoned himself at Miragoane on the 27th of that month, after being wounded in an engagement at Gaoy on October 22d. During the rebellion there was a battle between the steamers Dessalines and La Patrie, both vessels being considerably damaged, the Government craft, the Dessalines, losing its commander, and La Patrie seven men.

Natural Resources.—There is no tropical country on the earth capable of producing a greater variety of agricultural and mineral products than Hayti. The sugar-cane thrives nowhere better; it was introduced into the island by Columbus on his second voyage, in 1493, from Gomera, one of the Canary islands, and as early as 1506 it was cultivated to some extent, as it was found that it succeeded better than in any of the other islands; thence it was introduced by French Jesuits with some negroes into Louisiana in 1751. In 1791 Hayti exported to France 70,000 tons of sugar and 30,000 tons of coffee. While in all other tropical countries where slavery has been abolished the cultivation of staple products has gradually recovered from the effects of disorganized labor, this has been the case in Hayti only so far as coffee is concerned, of which the country still produces 35,000 tons annually on an average, or about as much as a century since. But its sugar industry has become practically extinct. The quality of the coffee, although pure-flavored, ranks lowest in the world's markets, because it is slothfully cultivated, gathered, and prepared, most of it mixed with black beans and fragments of stones; yet it is the staple product of the country, and a short coffee-crop involves poverty for a season.

The other agricultural products are cocoa (also lowest in quality) and a little cotton. Wax and honey are exported, and logwood, mahogany, and cedar of good quality are produced.

The country abounds in mineral deposits, but none is worked; thus, there are iron, tin, copper, manganese, cinnabar, and coal-seams at Camp Perrin and Aux Cayes, and gold is met with in a great many localities.

Native writers on Haytian economical and agrarian subjects complain that the system of rentals is bad on the plains, where the proprietor of the soil shares in the profits accruing from the cultivation of it with the small farmer who cultivates under a lease from him. In the mountain districts this is different, for there small plantations, the property of those cultivating them, abound, and the products are better prepared for market. These writers say it is a peculiar trait of the negro that, however small it may be, he wants to work on a plantation of his own, and only under such conditions will he bestow care on what he raises.

Commerce.—In the fiscal year 1881-'82 the amount of import duties collected at the eleven ports then opened to foreign trade was \$1,859,044, and of export duties, \$2,102,805. The aggregate value of merchandise imported at

Port-au-Prince during the same year was \$1,906,196, and the chief articles exported from there were coffee, 51,702,927 pounds; logwood, 264,012,050 pounds; cocoa, 3,382,199 pounds; and cotton, 1,790,832 pounds.

AMERICAN TRADE WITH HAYTI.

FISCAL YEAR.	Import.	Domestic export.
1879	\$2,790,476	\$3,148,757
1880	4,389,186	8,591,150
1881	4,717,909	4,873,931
1882	8,537,987	8,195,931
1883	2,971,515	8,162,733
Total	\$18,856,888	\$17,470,897

The following table shows the increase of coffee importation from Hayti into the United States:

Fiscal year.	Pounds.	Fiscal year.	Pounds.
1869	8,114,151	1876	11,687,503
1870	2,487,835	1877	12,269,244
1871	3,258,355	1878	12,813,113
1872	3,874,781	1879	16,660,080
1873	6,197,560	1880	22,650,285
1874	4,752,830	1881	31,903,074
1875	9,545,410	1882	22,227,950
Total	88,194,942	Total	180,673,904

The maritime movements of 1881 were as follow:

	Vessels entered.	Tonnage.	Steamers.	Tonnage.
In all Haytian ports . . .	793	695,194	853	564,977
At Port-au-Prince alone.	822	304,681	215	279,012

	Vessels called.	Tonnage.	Steamers.	Tonnage.
From all Haytian ports.	768	636,821	829	562,375
From Port-au-Prince alone	816	304,365	218	273,812

HICKS PASHA, Col. WILLIAM, an English officer, commanding an Egyptian expedition against the Mahdi in the Soudan, who perished with his entire army at the battle of Kashgate on Nov. 4, 1883. He entered the Indian army in 1849, and served through the Sepoy rebellion. In the Rohilcund campaign he was present at the action of Kukralee, at the taking of Bareilly, and in the battles of Bunnee, Mahomdee, and Shahjehanpore. He took part in the campaign for the subjugation of Oude and was with Lord Clyde at the capture of Sunkerpore, the defeat of Beni Madho, the capture of Fort Buxar, and through the operations across the Gogra. He was present in the subsequent actions with Nana Sahib. For bravery at the battle of Sitka Ghaut and in the capture of the enemy's guns, he received a medal. He became a captain in 1861. In the Abyssinian campaign of 1867-'68 he served as a brigade-major, and distinguished himself at the capture of Magdala, receiving a medal and the brevet rank of major. He was promoted to major in 1868, to lieutenant-colonel in 1875, and in 1880 became an honorary colonel, and was appointed to the reserve. He went to Egypt with the British military expedition, and, after serving

as chief of staff in the reorganized Egyptian army, was appointed by the Khedive commander-in-chief of the Soudan army. In 1882 the Mahdi had destroyed, at the battle of Gebel Geon, the main Egyptian force in the Soudan, led by Yussuf Pasha. In the winter he had captured by siege El-Obeid, the capital of Kordofan. Through the co-operation of the slave-traders and slave-owners, who now made

WILLIAM HICKS PASHA.

common cause with him, he could gather at any point an enormous army of black slaves, such as constituted the formidable military power of Sebehr a few years before, and were described by Gordon Pasha as "smart, dapper-looking fellows, like antelopes, fierce, unsparing, the terror of Central Africa." The Mahdi had captured many breech-loading rifles, and had a few disciplined troops who had joined him after surrendering at El-Obeid, but in the main his warriors were armed only with javelins and swords. The same slaves formed the flower of Arabi's army. Col. Hicks, on whom the Khedive now bestowed the title of pasha, enlisted as many of them as he could in his expeditionary force, but it was made up mostly of forced conscripts, some of them brought in chains to the transport-boats. He began his preparations in the spring, arrived at Khar-toum in July, and marched against the Mahdi in September at the head of a force of between 10,000 and 11,000. Not far from El-Obeid he

was entrapped in a rocky defile, where his Nordenfeldt and mountain guns were useless, and where there was no water for his soldiers. The battle lasted three days, and when the ammunition was exhausted Col. Hicks endeavored to break through the host of savages by a bayonet-charge. He was the last of the staff to fall, and used his revolver and sword with deadly effect until he was pierced by a lance.

HONDURAS, a republic of Central America. Area, 120,480 square kilometres; population, 350,000. Congress met on Oct. 15, 1883, and promptly accepted the resignation of President M. A. Soto, ordering the election of a successor. There were four candidates: Gen. Bogran, Don Monico Córdova, Don Celio Arias, and Gen. Delgado. Gen. Luis Bogran was elected. He was one of the ministerial triumvirate governing the country during the absence of President Soto after May, 1883, and he assumed the ministry of Public Works upon the death of Gen. Gutierrez, Sept. 13, 1883. The Cabinet was composed as follows: Minister of the Interior, of Justice, and Public Works, Gen. Bogran; Foreign Affairs, Public Instruction, and War, Señor Alvarado; Finance, Señor A. Zelaya.

The United States Consul at Amapala is Mr. C. Morris.

Finance.—During the fiscal year 1879-'80 the revenue amounted to \$969,854, and the expenditure to \$854,352; the budget estimate for 1880-'83 valued the annual income at \$861,970, and the outlay at \$759,980.

National Debt.—The consolidated home indebtedness is represented by bonds issued to the extent of \$1,000,000. The floating debt amounts to \$573,609.

Communications.—There is a line of railway in operation between Puerto Cortez and San Pedro, 37 miles. The length of telegraph lines in operation is 1,046 kilometres. In 1879 there were 19 post-offices, which forwarded 96,973 letters, 41,411 of these being government dispatches, 4,900 newspapers, and 47 sample packages. Income, \$3,026; expenses, \$18,078.

Commerce.—The President estimates that the average annual trade movement comprises exports worth \$1,305,000; viz.: gold and silver bullion, \$600,000; indigo, \$200,000; cattle, \$150,000; cabinet and dye-woods, \$180,000; and hides, \$100,000. The trade of the republic is carried on, on the Pacific shore, through the port of Amapala, and on the Atlantic shore through Truxillo and Omoa.

Pine-Forests.—A few miles from Santa Bárbara, in a region whose altitude is about 2,500 feet above the sea, the grand mahogany and huge cedar trees begin to diminish in size, and vast forests of yellow and red pitch-pine cover the foot of hills and mountain-tops. It may be safely asserted that half of the entire area of the republic is composed of these pineries. The fact that the West India islands and the republics of South America which border on the Atlantic consume millions of dollars' worth of pitch-pine lumber, shingles, etc., annually,

coming from the mills on the Atlantic seaboard and the Southern United States, has long since attracted the attention of enterprising merchants of Balize, British Honduras, who imagined that the pine-forests of Honduras might supply this constantly growing demand. The rivers Chamelicon and Ulua, with their numerous branches, drain the very heart of this prolific pine-region. Some of the most valuable of these forests border on the rivers, or are but a few miles from their banks, while the two rivers, after draining several departments, which cover one third of the area of the republic, flow into the sea a short distance from Puerto Cortez. The intention of the British capitalists was to utilize the advantages offered by the water-courses that seam the mountain-sides, and to establish saw-mills, put small steamboats on the rivers to tow barges filled with dressed lumber to Puerto Cortez, and there load ships for dispatch to the West Indian and South American ports. But the project was made so public that New Orleans energy and enterprise were attracted to the matter, and, while the English were forming their plans, quietly obtained franchises from the republic that virtually shut British enterprise out of the Department of Santa Bárbara. These franchises consist of the exclusive right to navigate the rivers Chamelicon, Blanco, Ulua, and Santa Bárbara, for fifteen years, together with important wood-cutting privileges, while the extensive navigation of the beautiful and spacious Lake Tojia has also been granted to a New Orleans company for forty years.

Mines.—The mineral resources of Honduras are considered by the Spaniards its chief wealth, and for two hundred years the mining of gold and silver has been its most active industry. During the past two years New York capital has been attracted to these minerals, and the veins are now being developed by modern machinery, where the systems of mining and reducing of ores have remained the same for a hundred and fifty years. In the district of Yuscaran, two New York companies are at work. The Yuscaran Mining Company has reopened the historical Quemarones by sinking and drifting below the old workings of the Spaniards, and proved that the old tales of fabulous wealth in these mines are true. A reduction company is erecting works here, with a capacity to treat 100 tons of ore a day, and the quiet Pueblo de Yuscaran is taking on the dress of a modern mining-camp. There are more than 100 mines in this district, all of which have been worked to some extent by the primitive methods. The expense of reducing ore by the "barrel system" is \$26 a ton, and ore running less than \$50 a ton has been left on the dumps as worthless. In the department of San Pedro, a New York company and a Chicago company are each erecting mills; and a French company is in operation. This district contains gold-mines exclusively; that of Yuscaran, silver

and gold. Opal-mines are also being worked in Honduras, and some of the finest opals in the Paris market are brought from there.

HOWE, Timothy Ots. An American statesman and jurist, born in Livermore, Maine, Feb. 24, 1816; died in Kenosha, Wis., March 25, 1883. He received a common-school education, and was occupied, out of school-hours, in farm-work. He was admitted to the bar in 1839, and began practice in Readfield.

Mr. Howe was an ardent Whig, and an admirer of Henry Clay. In 1845 he was elected to the Legislature of Maine, where he became active in the debates and the work of the House, and gained much reputation. His health having become impaired, in 1845 he removed to Wisconsin Territory, and found the change of great service. He opened an office in Green Bay, then a small village, separated from the rest of the Territory by belts of forest forty miles in extent, and this place continued to be his home for life. When the Territory became a State, in 1848, he was an unsuccessful candidate for Congress. Two years later he was chosen to be one of the circuit judges. These judges were also judges of the Supreme Court, and during part of his term he served as Chief-Justice of the State.

In 1854, after the passage of the Nebraska Bill, the Whigs, and others more or less in accord with them, met in mass convention, and organized the Republican party of Wisconsin. Judge Howe, being on the bench, took no very active part in politics, but was understood to be in hearty sympathy with the movement. He resigned his office of judge in 1855, and resumed the practice of law. He was much occupied in debates and discussions of the day, and proved himself to be an efficient speaker on the Republican side. He took part in a remarkable trial, in 1856, to ascertain who was the lawful Governor of the State—whether William A. Boynton, who received the certificate, signed by the Secretary of State, and took possession of the office, or Coles Bashford, who claimed that a majority of the votes were cast for him. The matter was submitted to judicial investigation and decision; Mr. Howe, as counsel, was very diligent and energetic in the conduct of the trial, and the result was that Bashford gained his case and entered upon his duties without further dispute. Judge Howe's reputation was largely increased by his management of this case, and his success in gaining it. In 1861 Mr. Howe was elected United States Senator, and he was re-elected twice. During his long career he served on the most important committees of the Senate—as Finance, Commerce, Pensions, Claims, etc. He was among the earliest advocates of universal emancipation, and also urged the right to establish territorial governments over the seceded States. He took issue with Andrew Johnson's policy, and made able speeches, in 1865-'66, against that policy. His course in this respect was unanimously approved by the Republicans

of his State. He also voted in favor of Johnson's impeachment. He supported the Silver Bill. He was in effect a radical Republican in his political views, and uniformly voted to extend the suffrage to negroes. Although, perhaps, not strictly to be called an orator, he was always impressive and forcible, and was particularly ready and fluent. President Grant offered him a judgeship in the Supreme Court, but Senator Howe declined it. He denounced President Hayes on the subject of civil-service reform as applied to the Southern States, and he spoke against the Anti-Chinese bill.

When the third-term question came up, Mr. Howe had left the Senate; but he favored the scheme, as regarding Gen. Grant, and in 1880 spoke strongly in its support. In 1881 he was appointed one of the delegates to the International Monetary Conference in Paris. He returned home in July, before the close of the conference, in consequence of his wife's illness. When Cabinet changes took place, after President Garfield's murder, Mr. Howe was appointed, in December, 1881, Postmaster-General. His service in this office was but little more than a year, but much was done during that time in post-office affairs. Postal notes were issued; reduction of postage was also effected, though the head of that department did not favor the measure. Other measures, such as postal savings-banks and postal telegraphs, he urged with great force.

It was while he was on a visit to the State of his adoption that his life was suddenly brought to its close. He left Washington in excellent spirits, and with assured health and strength; but having been exposed to a driving winter storm, and having taken a severe cold, he was violently attacked with pneumonia, and died in full consciousness that the end had come. Judge Howe's wife died in August, 1881. He left one son and one daughter.

HUMPHREYS, Andrew Atkinson, an American soldier, born in Philadelphia, Nov. 2, 1810; died in Washington, D. C., Dec. 27, 1883. He was graduated from the Military Academy at West Point in 1831. His first service was with the artillery. After the Florida war he resigned from the army, and was employed by the Government as a civil engineer, assisting Major Bache on plans of the Brandywine Shoal light-house, and the Crow Shoal breakwater in Delaware Bay. On July 7, 1838, he re-entered the service as first lieutenant of Topographical Engineers. From that date until May 31, 1848, when he was promoted to be captain in the same corps, he assisted in many important engineering works, and after his promotion was placed in charge of several topographical and hydrographic surveys. He greatly distinguished himself, with Major Abbot, by the survey of the Mississippi, which gave those two officers a wide reputation as engineers. Humphreys was promoted to the rank of major in August, 1861, and was employed on the staff of Gen. McCle-

lan as Chief of Topographical Engineers of the Army of the Potomac. He was advanced to the rank of colonel of volunteers, March 5, 1862, and participated in all the actions of the Army of the Potomac, up to and including the battle of Malvern hill, in which he commanded a division, having previously been appointed a brigadier-general of volunteers, April 28, 1862. He continued in the command of troops during the Maryland campaign which culminated at Antietam, and in the Rappahannock campaign, including Fredericksburg and Chancellorsville, receiving the brevet of colonel in the regular army for his services in the former battle. He was made a lieutenant-colonel, Corps of Engineers, March 3, 1863, and served as chief of Gen. Meade's staff from that date until July 8th, when he received a commission as major-general of volunteers. He was with Meade at Gettysburg, and remained with him until the surrender at Appomattox. On March 13, 1865, he was brevetted brigadier-general in the regular army for gallant services at the battle of Gettysburg, and brevetted major-general on the same day for gallantry and meritorious conduct at the battle of Sailor's Creek, Va. He was mustered out of the volunteer service August 31, 1866, promoted to the rank of brigadier-general in the regular army, and assigned to duty as chief of engineers, which office he filled until June 30, 1879, when he was retired at his own request.

In a general order announcing his death, Secretary Lincoln says: "In the discharge of his military duties Gen. Humphreys displayed great zeal, intelligence, and conspicuous gallantry. Those who served under him had the highest confidence in his capacity to command, and the greatest admiration of his soldierly qualities." In 1882 he published "The Virginia Campaigns of 1864 and 1865," followed by another work, "From Gettysburg to the Rapidan." His personal observations, the facilities which his residence in Washington afforded him of examining the archives of the War Department, and the simplicity and strength of his style of writing, have produced works that will prove of great value to the future historian of the war. His latest literary labors were several letters concerning his grandfather, Joshua Humphreys, who designed the six frigates constructed under a law approved by Washington, as President, in 1794. This valuable material was sent to Gen. J. G. Wilson, as a contribution to his "History of the Frigate Constitution," better known as "Old Ironsides."

Gen. Humphreys was a member of the American Philosophical Society of Philadelphia; the American Academy of Arts and Sciences, of Boston; the National Academy of Sciences, of which latter he was a corporator; and he was also an honorary member of the Imperial Royal Geographical Institute of Vienna, and the Royal Institute of Science and Art of Lombardy.

I

ICHTHYOL. This new remedy for skin-diseases is an oily product obtained from a peculiar bituminous mineral found in the region of Seefeld, in the Tyrol. The mineral occurs in beds of varying thickness lying in the midst of fossiliferous rock, which bears numerous fish-prints together with petrified fishes. It has been surmised that the bitumen owed its origin to the animal residue of fishes and other marine animals left there in prehistoric times, when the region was still submerged by the sea. Hence the name "ichthyol." To obtain the oil, the bituminous rock is first subjected to dry distillation in iron retorts; the fluid product which results soon separates spontaneously into a thick, tarry substance, and a fluid, dark-colored, strong-smelling oil. The latter is subjected to the action of concentrated sulphuric acid and other chemical processes, by means of which it is clarified and refined, when a neutral or slightly alkaline product results, having a peculiar odor. This product—ichthyol—is regarded as an extract from the original oil. Its chief ingredient is said to be a sulphur acid. Sulphur forms from two and a half to ten per cent. of its composition (according to the method of preparation). In appearance it is of a somewhat tarry character, but resembles none of the ordinary tars either in odor or chemical composition. Its consistency is about the same as that of vaseline. It forms an emulsion with water, and is miscible in any proportions with oils or vaseline. It is partly soluble in alcohol and partly in ether; wholly so in a mixture of both.

The efficacy of ichthyol as an application in skin-diseases is probably due to the sulphur it contains. The drug is probably, in part, an artificial production, and the chemical treatment by which it is produced increases the proportion of sulphur from two or three to ten per cent. It therefore strongly resembles, in its action and nature, a ten-per-cent. sulphur ointment, differing from the latter in that the sulphur is in a very intimate chemical union with the other ingredients.

IDAHO. Territorial Government.—The following were the Territorial officers during the year: Governor, John B. Neil, succeeded by John N. Irwin; Secretary, Theodore F. Singiser, succeeded by Edward L. Curtis; Treasurer, John Huntoon; Comptroller and Superintendent of Public Instruction, James L. Onderdonk. Judiciary, Supreme Court: Chief Justice, John T. Morgan; Associate Justices, Henry E. Priokett and Norman Buck.

Legislative Session.—The Legislature, which convened on the 11th of December, 1882, adjourned on the 8th of February, 1883. An act was passed to establish a public-school system, and to provide for the maintenance and supervision of public schools. This act makes the

Comptroller *ex officio* superintendent, provides for the election of a county superintendent in each county having more than five school districts, for the election of trustees in each district, for the examination of and granting certificates to teachers, and for teachers' institutes in the larger counties. Another act provides for the registration of the names of electors and for the prevention of frauds at elections. Other important acts are the following: Regulating the killing of game and catching of fish; preventing the spread of scab or other infectious diseases among sheep; to prevent cruelty to animals, and protect the public from the sale of unwholesome food.

Finance.—At the date of the last returns to the Comptroller, the total assessed value of the real and personal property in the Territory amounted to \$9,106,450.05. The increase in valuation is shown by the following table:

1878.....	\$4,520,500 50	1881.....	\$3,066,365 75
1879.....	2,926,149 60	1882.....	9,103,450 05
1880.....	6,408,059 14		

The number of taxable inhabitants has increased in like proportion.

The net receipts from all sources for the two years ending Oct. 1, 1882, including balance on hand at date of last report, were \$118,638.39. The disbursements for all purposes, including the payment of all outstanding warrants and several items of special expenses authorized by the last Legislature, were \$76,821.42.

The bonded indebtedness of the Territory amounts to \$69,248.60, divided as follows: Bonds issued under the act of 1875, due Dec. 1, 1885, \$22,538.54. Bonds issued under act of 1887, due Dec. 1, 1891, \$46,715.06.

Agriculture and Mining.—On these subjects the Governor, in his message to the Legislature in December, 1882, says:

Within our borders there is a large agricultural area—delightful valleys and sunny plains stretching out in all directions—containing, in the aggregate, many millions of acres of as fertile land as can be found in any State or Territory of the Union. Here the honorable pursuits of agriculture are being followed, with the most gratifying results. No country in the world produces finer grain or grows more delicious fruit than Idaho. But, while there is ample scope within our boundaries for great numbers to engage successfully in agriculture, mining is at present, and must continue to be for many years, our chief industry. In a few years after the organization of the Territory, Idaho added to the wealth of the country nearly \$75,000,000 in the precious metals, mostly of gold from the placer-mines.

The practical working out of the "virgin ground" of the rich placer claims caused a falling off in Idaho's output, and for several years there was a steady decline in the amount produced. In early days but little attention was given to quartz-mining, though the existence of valuable ledges was known. But the decline in placer-mining caused attention to turn to this, and enough has been accomplished to demonstrate the fact that our resources in this line are far more extensive than they were in placer deposits. But, with the com-

pletion of the lines of railway, now building and projected, our facilities for economical mining will be equal to those of any other section of the country.

Polygamy.—On this subject the Governor says:

Among the numerous subjects discussed in my first biennial message was that of polygamous Mormonism; but my recommendations in regard to the suppression of this evil were not heeded by your predecessors. I then believed the evil to be a dangerous and formidable one, and undertook to show how it was reaching out in all directions, with the avowed purpose of seizing political power in this country—made plain, I thought, the fact that its strides toward the attainment of that end in Idaho were altogether too rapid, and too near realization, to justify us in longer ignoring the situation. But, as potent as I then depicted this unseemly power, the sequel proved that I had underrated its strength. The adjournment of the eleventh session of the Legislative Assembly, without the adoption of a single measure to suppress polygamy, proved conclusively, to my mind, that it was able to dominate that body, in so far at least as to prevent the passage of laws prejudicial to the practice. Once more it becomes my solemn duty to warn the legislative power against further toleration of a practice so fraught with woe to all that we, as Americans, hold dear; for I feel certain that the complete realization of the scheme of the Mormon priesthood means the entire subversion of all those rights and privileges enjoyed under our free institutions. The verdict returned in the recent election shows that my confidence in the people was not misplaced. They demand the complete extirpation of polygamy within our borders. You are here to give effect to their mandate, and it is with infinite satisfaction that I now suggest the adoption of some such measures as the following: That the law of evidence be so framed that no person shall be excluded from testifying, in any proceeding in prosecution for polygamy, on account of marriage relations with defendant; that cohabitation with more than one wife constitutes a continuous offense, and that to preach in favor of the doctrine of polygamy, or publicly or privately to advise, counsel, or encourage others to commit polygamy, or knowingly to aid or assist others to enter into polygamous relations, be made a crime punishable as severely as the crime of polygamy itself, and that Congress be memorialized to amend the present anti-polygamy laws, to the end that the now well-recognized defects in the same may be remedied, so as to render possible the conviction of the guilty, by giving United States and Territorial courts co-ordinate jurisdiction. I also desire to direct attention to an act of the last session of Congress, known as the "Edmunds bill." By that act all polygamists are disfranchised and disqualified for office; but the machinery for enforcing the provisions of the law apply to Utah only. It is no exaggeration to say that in two or more counties in this Territory polygamists vote and hold office precisely as though no such law were upon the statute-books. This is a state of affairs which requires a remedy at your hands.

Education.—The educational system of Idaho has not been well organized. The provisions relative to superintendence were imperfect, and the means of collecting statistics inadequate. The table in the next column gives the latest and fullest statistics accessible.

There were no returns for Ada county in 1881 or 1882. In 1881 Idaho county returned an enrollment of 289, and proportional attendance of 155.

With a few exceptions, the salaries paid teachers range from \$75 a month in the central and mining counties down to \$20 and even \$10 a month in the agricultural counties.

Resources.—Idaho has an area of 55,228,160 acres, of which 18,400,000 are classed as mountainous. There are about 600,000 acres of lake area. The principal ones are Lake Pend d'Oreille, 120 miles long and from 5 to 10 miles wide, navigable throughout; Lake Cœur d'Alène, 86 miles long and 8 to 5 miles wide; and Kaniaku lake, 10 by 20 miles; all noted for their scenery and abounding in fish.

Alternating with the mountain-ranges are many valleys, large and small, affording a vast area of agricultural lands not exceeded in fertility by any in the world. The most extensive are Boise, Snake, Payette, Clearwater, Lemhi, Weiser, Blackfoot, Malad, Palouse, Potlach, and Bear. The arable portions of these valleys lie from 600 to 5,000 feet above the sea, and they range in size from one to 20 miles in width, and from 20 to 100 miles in length. In the northern portion of the Territory excellent crops of cereals are raised without artificial irrigation. In the central and southern parts irrigation is essential, although there are occasional small tracts lying near the level of the streams on which grain-crops may do well without.

Traversing Southern Idaho is the extensive volcanic belt, or basin of Snake river, fit only for grazing. Upon its nutritious grasses and sage are fattened thousands of cattle annually.

The forest area is 9,000,000 acres, much of it being included in the mountain-region above described. Throughout the central, northern, and eastern parts of Idaho the woodlands possess a heavier growth than in a majority of the timbered States east of the Rocky mountains, while in the remaining sections the timber-supply is not inferior to that of the most of our prairie States. Along the Clearwater, in Northern Idaho, and in several other sections, white-pine logs one hundred feet long and five feet in diameter, and red and white cedar-trees two to five feet in diameter, are common.

The minerals are gold, silver, copper, iron, lead, coal, plumbago, quicksilver, and others of minor value. There are also mountains of sulphur, productive salt-springs, quarries of the

* Estimated.

finest marble and building-stone, large deposits of merchantable mica, and semi-precious stones. Idaho's precious metal belt is 350 miles in length and from 10 to 150 miles in width.

Progress during 1883.—It is estimated that there was an increase of at least 10,000 in the population during the year. The mines yielded about \$5,000,000, which, it is expected, will be largely increased in 1884. The agricultural resources increased 25 per cent. In 1882 gold was discovered in the Cœur d'Alène district, in Northern Idaho. During 1883 prospecting has been going on, and there has been a large influx of miners. It is believed that when developed these mines will yield rich results. They are situated on Prichard, Gule, and Beaver creeks, tributaries of the North Fork of Cœur d'Alène river, about thirty miles south of the Northern Pacific railroad. Fort Cœur d'Alène is the nearest accessible point of supply. Galena has also been found in this region.

IGUANODON, THE. The iguanodon was a gigantic dinosaurian, the fossil remains of which were first discovered by Dr. Mantell in the Wealden of England in 1822. Its name, which signifies "iguana-like teeth," was suggested by the similarity in the appearance of its teeth, with their serrated cutting edges, to those of the iguana. Otherwise there appears to have been but little similarity between the two animals. The iguanodon was supposed by the older geologists to be of habits like the hippopotamus, and to have wallowed in the mud and fed on the rank herbage of the marshy grounds. Much new light has been thrown upon the structure and habits of the iguanodon by the numerous remains, including some nearly complete skeletons, which were found in 1878 at the coal-mines of Bernissart, Belgium. The fossils occur

there, like those discovered in England, in the Wealden or lower cretaceous strata, called *morts-terrains* by the workmen, overlying the coal-beds, which have to be penetrated for about twelve hundred feet before the coal is reached. Being charged with iron pyrites, the bones were quite friable and difficult to remove, but the task was accomplished successfully under the supervision of M. Depauw, of the museum at Brussels, who adopted the habits of the miners and spent three years in the work. The bones have been for two years under the constant study of M. L. Doilo, who believes he has identified the skeletons, or parts of them, of twenty-three individuals, two of which are of the species *I. Mantelli*,

IGUANODON BERNISSARTENSIS.—(At the Brussels Royal Museum of Natural History. Restored and mounted by M. L. F. Depauw.)
 Head: a, left nostril; b, left orbit; c, left temporal fossa. Vertebral column: d, cervical region; e, dorso-lumbar region; f, sacral region; g, caudal region; h, left scapula; i, left coracoid; j, left humerus; k, left radius; l, left ulna; m, left tibia; n, left fibula; o, left femur; p, left tibia; q, third trochanter. 1, II, III, IV, V, digits; r, left phalanx; s, left post-pubis; t, left femur; u, left tibia; v, left fibula; w, third trochanter. 1, II, III, IV, V, digits; X, diagrammatic transverse section of the body between the fore and hind limbs.

and twenty-one of the species *I. Bernissartii*. M. Depauw has set up and mounted one of the skeletons, which he has been able to restore nearly complete, except for a few phalanges and other minor details. Some interesting conclusions have been deduced from the labors of these two naturalists. The iguanodon belonged to the sub-class of dinosaurians and the order *Ornithopoda*, or bird-footed. Among the special characteristics of the family are a single row of teeth, three functional digits on the foot, and two symmetrical plates, which Prof. Marsh regarded, from studies in the British Museum, to be clavicles, and in which he traced a point of structural resemblance with birds, but which M. Dollo declares, from the Bernissart specimens, to be sternal plates. According to M. Dollo's restoration, the animal stood on its hind-limbs and maintained an erect position, like the birds. Several different lines of coincidence tend to prove this supposition to be correct. Among them are the remarkable resemblances between the structure of the pelvis and posterior limbs of birds and that of the corresponding parts in the iguanodons. Points of resemblance of the ilium and ischium, indicated by Prof. Huxley twelve years ago, are fully confirmed. The pubis is very large in the iguanodon, and projects forward and outward, forming an obtuse angle with the post-pubis. The post-pubis is long and slender, and directed backward alongside the ischium, as in birds, for a considerable distance beyond the ischial tuberosity. M. Dollo is inclined to agree with Prof. Marsh in identifying the dinosaurian pubis with the pectineal process of birds—a conclusion which is supported by the recently published observations of Miss Alice Johnson, of Cambridge, England, "On the Development of the Pelvic Girdle in the Chick," in which it is shown that in the embryo foot the cartilaginous representative of the pectineal process is at first much larger and more prominent in proportion to the development of the pelvis than subsequently, and becomes gradually reduced as development proceeds. The fore-limbs are considerably shorter than the hinder ones, and are massive and strong; the volume of the head and thorax is considerably reduced as compared with that of reptiles generally; and the position of a large mass of the viscera is behind the hip-joint, as is the case with birds. These facts tend to support the theory that the posture of the animal was erect, for they indicate that a considerable proportion of its weight was thrown back, whereby, with the aid of the long tail, its body was more easily and securely balanced in that position. Further evidence in the same direction is given by the number of toes, which were five on the fore-feet, and four, leaving a three-toed track, on the hind-feet. The tracks of the iguanodon in the Wealden—which could not have been made by any other of the known dinosaurians of the formation—are three-toed. M. Dollo has com-

pared the hind-feet of the fossils with these tridactyl foot-prints, and has found them to fit accurately. If the iguanodon had walked on all-fours, it would also have left five-toed tracks, while none such have been found. Another structural resemblance to birds has been traced in the fact that the dorsal spines of the vertebrae are connected by a set of ossified ligaments binding the whole dorso-lumbar region into a rigid mass. The head is relatively small, and is very much compressed from side to side. The nostrils are spacious, and chambered in their anterior region; the orbits are of moderate size, and elongated along the vertical. The temporal fossa is limited above and below by a bony arch, a disposition which is otherwise found among living lizards only in the *Hatteria*. The distal extremities of both jaws are without teeth; while there are ninety-two teeth in the hinder parts of the jaws, and these, as with other reptiles, were replaced by new ones as fast as they were worn out. The skin was smooth, or covered only with epidermic scales. Some observers believe that they have found in the foot-prints of the iguanodon evidences that a slight web existed between the toes. The first finger, or thumb, constitutes a horny spur, the remains of which are supposed to have led Dr. Mantell to believe that the iguanodon had a nasal integumental horn. In restoring and setting up the skeleton represented in the figure, M. Depauw was a little embarrassed by the fact that some of the bones could not be separated from the matrix; consequently, the restoration has a degree of stiffness, but not enough to attract the attention of casual observers. As the skeleton stands, the tip of the snout is fourteen feet two inches from the ground, and the horizontal length, from the tip of the tail to a point immediately under the tip of the snout, is twenty-three feet nine inches. M. Dollo has drawn a conjectural outline of the body of the animal, which is represented in the engraving. Leaving out the long tail, its general shape is like that of a duck. The sectional view, represented by X, indicates that the animal was relatively narrow and sharp-keeled. The tail was shaped like that of the crocodile, and was probably a powerful swimming organ. The neck was comparatively slender and capable of free movements. The iguanodon was an inhabitant of marshes—so far as is known, of freshwater marshes only—and probably fed on large ferns, many of which were found with the Bernissart specimens.

ILLINOIS. State Government.—The following were the State officers during the year: Governor, Shelby M. Cullom, who resigned February 7th, and was succeeded by Lieutenant-Governor John M. Hamilton (Republican); Secretary of State, Henry D. Dement; Treasurer, John C. Smith; Auditor, Charles P. Swigert; Attorney-General, James McCurtney; Superintendent of Public Instruction, Henry Raab. Judiciary, Supreme Court: Chief-Jus-

tice, John M. Scott; Associate Justices, Alfred M. Craig, John M. Schofield, T. Lyle Dickey, Pinkney H. Walker, John H. Mulkey, and Benjamin R. Sheldon. Soon after his accession to office, Gov. Hamilton appointed William N. Brainard, E. O. Lewis, and Charles Stratton Railroad and Warehouse Commissioners.

Legislative Session.—The Legislature convened on the 8d of January, and adjourned on the 18th of June. On the 17th of January Gov. Cullom, Republican, was chosen United States Senator by a vote of 107 to 95 for John M. Palmer, Democrat. Among the acts of this session were the following:

An act to revive the law in relation to the Department of Agriculture, agricultural societies, and agricultural fairs, and to provide for reports of the same; appropriating \$581,712 for the completion and furnishing of the State House and for the improvement of the grounds, and providing for the submission of the appropriation to a vote of the people at the general election in November, 1884; requiring operators of butter and cheese factories on the co-operative plan to give bonds to make report of their business; dividing cities and villages subject to overflow and inundation into improvement districts, and providing ways and means to raise the streets, lots, and blocks above the line of overflow; another act for protection against inundation and overflow, permitting owners of land to construct drains for agricultural purposes; fixing the minimum license fee at \$500 for dram-shops, and \$150 for malt-liquors only in cities, towns, and villages, and authorizing county boards to grant licenses on like terms upon petition of the legal voters of any town or election precinct; governing foreign fire, marine, and inland navigation insurance companies doing business in the State; providing for the organization and management of corporations, associations, or societies for the purpose of furnishing life indemnity or pecuniary benefits to widows, orphans, heirs, relatives, and devisees of deceased members, or accident or permanent disability indemnity to members thereof; requiring railroad corporations organized or doing business in this State under its laws or authority, to have and maintain a public office or place in this State where transfers of stock may be made; a compulsory education act for children between eight and fourteen, requiring at least twelve weeks' schooling a year.

State Regulation of Railroads.—In May the Supreme Court of the United States rendered a decision in the so-called "granger" case of Neal Ruggles against the State of Illinois. This case arises out of the facts below set forth:

On March 18, 1878, Morgan A. Lewis, a passenger on the Chicago, Burlington, and Quincy road, tendered Neal Ruggles, a conductor, eighteen cents as fare for his transportation from Buda to Neponset, six miles. This was at the maximum rate of three cents a mile, as prescribed by the statute. The conductor demanded twenty cents, the fare fixed by the company. Lewis refused to pay more than eighteen cents, and the conductor thereupon attempted to eject

him from the car. For this act the conductor was prosecuted upon a charge of assault and battery and fined ten dollars and costs. The case was then carried up through the State courts by successive appeals, the railroad company sustaining the conductor and raising the question of the right of the State to interfere with its business by fixing rates of fare and transportation. A decision was finally rendered in favor of the State by its highest court. The railroad company thereupon appealed to the Supreme Court of the United States on the ground that the act of the General Assembly of Illinois, of April 15, 1871, fixing the maximum rate of charges for the transportation of passengers on railroads in the State, was unconstitutional and void, because it impaired the obligation of the contract contained in the charters of the various companies which were merged into the Chicago, Burlington, and Quincy company by consolidation.

The Supreme Court of the United States holds: 1. That grants of immunity from legitimate governmental control are never to be presumed. On the contrary, the presumptions are all the other way, and unless an exemption is clearly established, the Legislature is free to act on all subjects within its general jurisdiction, as public interests may seem to require. The State may limit the amount of charges by railroad companies for fares and freights, unless restrained by some contract in the charter. 2. That in the present case there is no such restraint. The judgment of the Supreme Court of Illinois is affirmed with costs.

Assessment of Property.—The comparative statement of the assessments made by local assessors for 1882 and 1883 shows a total assessed value of \$750,635,758 in the former and \$756,422,291 in the latter year.

The assessment of Cook county amounted to \$180,547,041 in 1882, and to \$188,639,806 in 1883. The assessments on the capital stock of corporations aggregated \$2,218,430.

State Institutions.—The financial record of the State Board of Public Charities for the quarter ended Dec. 31, 1883, shows the following expenditures for each institution for that period:

	Ordinary.	Special.
Northern Insane Hospital.....	\$29,742 00	\$12,956 00
Eastern Insane Hospital.....	26,195 00	58,550 00
Central Insane Hospital.....	32,528 00	18,065 00
Southern Insane Hospital.....	25,649 00	15,407 00
Deaf and Dumb.....	27,620 00	67 44
Institution for the Blind.....	8,779 00	938 56
Asylum for Feeble-Minded.....	18,920 00	3,264 00
Soldiers' Orphan Home.....	16,942 00	4,653 00
Eye and Ear Infirmary.....	4,479 00	876 00
Reform School.....	11,469 28	25,998 00

The April reports of the penitentiaries show that on March 1st the Joliet Prison had 1,419 males and 22 females; at the Southern Penitentiary March 1st there were 555 prisoners.

Corn-Crop.—The acreage and yield of the corn-crop of this State the past ten years is given below:

YEAR.	Acreage.	Yield in bushels.
1874.....	7,421,055	188,579,000
1875.....	6,168,265	260,000,000
1876.....	8,920,000	228,000,000
1877.....	8,935,411	269,897,742
1878.....	8,672,088	250,560,510
1879.....	7,918,861	205,918,377
1880.....	7,574,545	250,607,086
1881.....	7,157,324	174,491,706
1882.....	7,371,250	179,471,729
1883.....	7,304,596	186,568,553
Average.....	7,943,912	227,419,606

The 1883 corn-crop, while somewhat larger than the small crops of 1881 and 1882, will not furnish nearly as much marketable corn.

The quality of corn in 1883 is reported up to an average in only the following counties: Gallatin, Jasper, Massac, Randolph, and Union, all of which are in the southern portion of the State. The average yield and quality of corn are as follow:

DIVISION.	Average yield per acre.	Quality, compared with an average per cent.
	Bushels.	
Northern.....	21	46
Central.....	29	73
Southern.....	26	88
Average of State.....	25	69

Coal-Product.—Illinois has no equal, west of Pennsylvania, in the abundance of its coal deposits, its accessibility, and means of transportation. It supplies not only its own great demands, but almost wholly those of the markets of Chicago and St. Louis. The following statistics are for 1888:

Number of counties producing coal.....	49
Number of mines.....	689
Number of acres of coal-lands owned or controlled by owners of mines.....	110,898
Number of acres worked out.....	12,829
Number of men engaged.....	38,929
Number of tons produced.....	10,508,791
Increase over 1882.....	1,896,188
Value of same at mines.....	\$15,810,529
Amount of capital employed.....	\$10,896,540
Estimated capacity of annual production (tons).....	21,086,425
Number of casualties, all kinds.....	360
Number of fatal accidents.....	184

The two great mining catastrophes of the year at Braidwood and Coulterville caused seventy-nine deaths. The increase in the number of counties producing coal is three, Cass, Edgar, and Macon. In the former, two mines have been opened, at Virginia and Ashland. In Edgar county, at Illiana, near the Indiana line, there is a new plant costing \$60,000; and in Macon, two first-class mines at Decatur and Niantic, involving an investment of \$15,000. Next year Christian county will enter the list with a mine at Pana, over 700 feet deep, opening a vein seven feet thick. The steady advance of the production in a period of years is shown by the following table:

	Number of establishments.	Number of men employed.	Number of tons produced.	Value.
1870.....	823	6,301	2,624,168	\$6,079,489
1880.....	590	14,079	6,115,877	8,779,883
1882.....	704	19,420	9,115,658	13,696,257
1888.....	689	23,989	10,508,791	15,810,529

Temperance.—The Illinois State Temperance Union met in Springfield in January. The report of the State organizer was a strong argument in favor of prohibition, from a moral point of view. He gave a list of twelve counties that have adopted anti-license laws, viz.: Cumberland, Edwards, Fulton, Jasper, Johnson, Lawrence, Menard, Platt, Schuyler, War-

ren, Wayne, and Stark. These counties, with a total population of 221,871, had only forty-eight prisoners in jail during the year, and twenty-four of these were incarcerated on account of crimes arising from drunkenness. On the other hand he mentioned twelve counties, with 298 licensed saloons, and a population of 217,597, with 801 prisoners in the various jails. During 1882, 117 murders were committed in the State, 61 in Cook county, nearly all having their origin in drunken quarrels.

The plan of work recommended the establishment of a weekly or monthly newspaper in every county in the State; the circulation of temperance literature; the holding of temperance meetings and the development of home talent in the cause; the securing of special temperance sermons; the organization of Bands of Hope, and the study of temperance textbooks and manuals.

The same body met in Bloomington in December, voted to consolidate with the National Prohibition and Home Protection party, and recommended immediate party organization throughout the State.

Colored Convention.—A State convention of colored citizens was held in Springfield on the 16th and 17th of October. Fifty delegates, representing eight counties, were in attendance. The subjects of civil rights, education, and labor were considered. A plan for a permanent organization was adopted. The resolutions adopted were as follow:

Resolved, That while we are proud of the noble record of the Republican party in the past in the interest of the negro race, we solemnly pledge ourselves to not vote for any man for office who will not give us that recognition to which we are justly entitled.

That we will not vote for any man for office in the future who has not shown a disposition, while in office, to act honorably and fairly toward colored applicants for political preferment.

Resolved, That we recognize in the Douglas Louisville speech a "new departure," the principles of which are the underlying elements of the future success of the negro race of this country; we therefore adopt it as our idea of right and justice.

An address was also put forth, in which industrial education and co-operation were urged upon the people.

INDIA, an empire in Asia, subject to Great Britain. By the act of Aug. 2, 1858, the powers previously vested in the East India Company were assumed by the crown. The functions exercised by the company and the Board of Control were transferred to the India Office and placed under the direction of the Secretary of State for India. The Queen of Great Britain and Ireland was proclaimed Empress of India Jan. 1, 1877. The executive authority in India is vested in the Governor-General, popularly entitled the Viceroy, who acts under the direction of the Secretary of State for India. Subject to the approval of the latter, who is invariably a member of the British Cabinet, the laws are elaborated by the Governor-General in council. The council of

the Governor-General consists of five ordinary members and the commander-in-chief of the military, appointed by the crown, who preside over the departments of Foreign Affairs, Finance, the Interior, Military Administration, and Public Works; but their functions are simply administrative. The governors of presidencies and provinces are appointed by the crown, the lieutenant-governors of provinces by the Governor-General, subject to the approval of the Secretary of State for India. The Governor-General in council has power to make laws for all persons in the subject provinces, and for British subjects in the protected native states. The Secretary of State is assisted by a council of fifteen members.

The Governor-General is the Marquis of Ripon, who succeeded Lord Lytton June 8, 1880.

The Secretary of State for India is Earl Kimberley, previously Secretary of State for the Colonies, who succeeded the Marquis of Hartington on the transfer of the latter to the Ministry of War, Dec. 16, 1882.

Population.—In 1881 the total population of British India, including feudatory states, was 254,899,516. The British population of India, exclusive of the army, was, in 1871, 64,061, of whom 38,946 were males and 25,115 females. In respect of occupation, 14,822 belonged to the civil service and professional classes, 12,708 to the domestic, 7,998 to the commercial, 614 to the agricultural, 2,595 to the industrial, and 25,329 to the indefinite and non-productive class.

The occupations of the adult male population were given in the census of 1881 as follow :

Government officials.....	1,504,849
Army and navy.....	811,870
Various professions.....	1,913,247
Domestic.....	3,177,599
Merchants and traders.....	1,870,017
Carriers, porters, etc.....	1,863,103
Agriculturists and horticulturists.....	51,374,586
Persons engaged about animals.....	754,513
Mechanics, artisans, miners, etc.....	64,985,741
Other laborers.....	7,674,600
Persons of rank and property.....	46,262
Of no stated occupation.....	48,794,195

Emigration.—The emigration of coolies numbered 16,794 in the year ending March 31, 1881, 17,428 in 1880, 22,092 in 1879, 24,710 in 1878, 10,560 in 1877, 11,489 in 1876, 25,325 in 1875, and 29,249 in 1874. Of the emigrants in 1881, 4,416 went to British Guiana, 4,176 to the British West Indies, 3,207 to the French West Indies, 2,378 to Natal, 1,076 to Réunion, 965 to Surinam, and 581 to Mauritius. In 1881-'82, though the demands for coolies were as great as in the previous year, the emigration was 8,600 less. The majority of laborers shipped from Calcutta came from the Northwest Provinces and Oude, 57 per cent. from the former, and 20 per cent. from the latter. There returned during that year 8,160 emigrants, who brought back on an average £20 each.

Commerce.—The total value of the imports and exports, for the ten years 1873-'82, was as follows for each year :

YEARS ENDED MARCH 31.	Imports.	Exports.
1873.....	£28,481,210	£26,540,043
1874.....	39,623,562	56,940,078
1875.....	44,868,184	57,984,539
1876.....	44,198,063	60,291,781
1877.....	43,876,751	63,043,759
1878.....	53,819,644	67,493,324
1879.....	44,857,848	64,319,741
1880.....	52,621,396	66,247,511
1881.....	62,104,264	76,021,043
1882.....	60,486,000	63,066,000

The exports and imports of treasure, included in the above, were of the following values :

YEARS ENDED MARCH 31.	Imports.	Exports.
1873.....	£4,566,585	£1,298,079
1874.....	5,792,584	1,914,071
1875.....	8,141,047	1,625,309
1876.....	5,500,723	2,200,226
1877.....	11,486,118	4,028,698
1878.....	17,365,460	2,210,904
1879.....	7,056,749	8,982,238
1880.....	11,656,395	2,035,148
1881.....	8,968,214	1,440,441
1882.....	11,323,000	1,100,000

The returns for the year ending March 31, 1883, show a volume of commerce exceeding that of any former year. The total imports were £65,552,100 in value; the exports, £84,526,700. The imports of treasure amounted to £12,400,000, of which £5,090,000 were gold and £6,270,000 silver.

Agriculture.—The tea product of Bengal in 1881-'82 was 8,838,000 pounds, an increase of 2,000,000 pounds on that of the previous year. The produce of cinchona-bark in that province amounted to over 840,000 pounds, the greater part of which is consumed in the country. The quantity of manufactured febrifuge sold was 10,000 pounds, against 8,650 pounds in 1880-'81. Besides the Bengal plantations there are extensive areas planted to cinchona in the Neilgherry Hills and in the Madras Presidency, where the crop amounted to 250,000 pounds, all of which was shipped to England. The wheat product of Northern and Central India was a few years ago insignificant, but it has lately become one of the leading articles of export. The wheat exports in 1881-'82 were 166 per cent. greater than in the preceding year. The harvest of 1882 was so abundant that, for the lack of communication and an export market, the ryots of Bengal and other parts of India were unable to sell their produce, a state of things which produced monetary distress among the people and helped to embarrass the finances of the Government.

Railroads.—The internal commerce of India has been developed by the construction of several great lines of railway, under the guarantee of the Government. When in 1845 it was found impossible to raise the capital to build certain lines undertaken by two companies, it was determined by the Indian Government to guarantee to the railway companies, for a term of 99 years, a rate of interest of 5 per cent. Power was reserved by the Government to su-

perwise and control their proceedings by means of an official director. In 1869 the Government of India decided on carrying out all new railway extensions.

The number of miles of railroad open to traffic in the beginning of 1882 was 9,875, of which 4,590 were guaranteed lines, and 5,285 were state railroads. The number of passengers on Indian railroads rose from 15,999,633 in 1869 to 52,239,865 in 1881.

Post-Office and Telegraphy.—The number of letters, newspapers, and parcels which passed through the Post-Office in 1881 was 158,666,856, having increased from 89,561,685 in 1872.

The length of telegraph lines in operation in 1881 was 19,679 miles, having increased from 15,336 in 1872. The length of wires in 1881 was 54,318 miles. The total receipts were £452,872; the expenses, £310,371. The total number of messages sent was 1,658,647. The number of offices was 254.

The Army.—The total number of British troops stationed in India, according to the army estimates for 1888-'84, is 61,641. The strength of the native army is 126,088.

Finances.—The receipts and expenditures, as given in the closed accounts of the last three years published, amounted to the following sums:

YEAR.	Gross receipts.	Expenditures in India.	Expenditures in England.	Total expenditures.
	Pounds.	Pounds.	Pounds.	Pounds.
1878-'79	63,199,609	49,314,000	18,851,296	68,165,356
1879-'80	63,434,666	55,119,951	14,547,664	69,667,615
1880-'81	72,539,978	62,183,503	14,420,925	76,604,388

The Public Debt.—The total amount of the public debt was £59,943,814 in 1857. In the next five years it rose to £99,652,053. Between 1862 and 1868 about £4,500,000 were paid off, but in the fifteen years following about £89,000,000 were added to the debt. The amount on March 31, 1881, was £157,888,879.

Land Settlements.—The land revenue constitutes over one third of the total income of the Government. Before the mutiny it furnished more than half of the receipts of the East India Company. The share of the Government in the profits of the land has been determined in the different provinces by various settlements. The settlements in Bengal and Benares are permanent, those in other parts of India subject to periodical revision. The older settlements give the state about two thirds of the annual profits of the soil. In the revised settlements recently made the share of the Government is about one half of the natural rent.

In Bengal the land is chiefly owned by zemindars. The settlement of Lord Cornwallis, in 1793, in order to create a class of loyal local magnates throughout the country and to assimilate the land system to that of Great Britain,

confiscated the lands of the ryots and bestowed them upon the former collectors of the taxes, who were vested with the entire ownership of the soil. In recent times, since the zemindars have proved a useless class, while the ryots have suffered greatly, there has been a desire to undo the act of Lord Cornwallis. It has finally been decided that the zemindars are not absolute proprietors, and an important part of their proprietary rights has been taken away from them by the Bengal tenancy bill, enacted in 1883.

The main objects of the bill are to give reasonable security to the tenant in the occupation and enjoyment of his land, and also to secure the landlord in the settlement and recovery of his rent. The provisions of the act realize as nearly as possible the principles of the Irish Land-League party enunciated in the "three F's"—fair rent, fixed tenure, and free sale.

Local Self-Government.—Lord Ripon's scheme for the tentative introduction of local self-government by representative native bodies was initiated by a law passed by the Supreme Council for the Central Provinces early in January. Each district is divided into circles, formed by aggregating several villages; a number of these circles are combined into a group, and their local affairs are administered by a local board for each group. These local boards are composed of the executive head-men of the villages within the group; representatives of the mercantile and professional classes, elected by them or appointed on their behalf; and a number, not to exceed one third of the whole, nominated by the Government. The local boards are supervised by district councils, a part of the members of which are elected by them, a part are nominated by the Government, and a part are representatives of the educated classes. The local boards are intrusted with the administration of roads, schools, hospitals, markets, wells, famine-relief works, tree-planting, pounds and ferries, etc.

The Ilbert Bill.—The promises made by the present British Cabinet to develop native self-government are in accordance with the policy advocated by Lord Lawrence and initiated by Lords Mayo and Northbrook in the decentralization of finances and the establishment of municipal councils. It is in the direction of reforms already begun by Earl Dalhousie, but arrested and delayed until the present in consequence of the Sepoy rebellion. This policy has been opposed by the Conservative party, in sympathy with the military class and with a large proportion of the Anglo-Indian officials, used to the exercise of despotic power, who look upon India chiefly as a field for the exercise of English administrative talent, and think that the country would fall into chaos and anarchy if the English rule were removed, and that this can only be maintained by tyranny and military power. Believing it necessary to treat the Hindoos as a conquered race, they

think it essential to preserve broad legal distinctions between the races. Race prejudice, which is a universal feeling, and is strongest among the most ignorant, is largely responsible for this sentiment, which is less justified than formerly, since a considerable class of natives have received a European education, while a class of degraded, ignorant, and idle Europeans has accumulated in the cities. It was owing to this idea that the natives must be treated as an inferior and servile race that the Government met with sudden and unexpected opposition to a proposed law of slight importance, but from which, in view of their general policy, they were unwilling to recede. A native member of the Civil Service, Mr. B. L. Gupta, called attention in January, 1882, to the anomalous position of native magistrates and sessions judges. Native judges in presidency towns have jurisdiction over Europeans; but when transferred or promoted to a position in the Mofussil, or country districts, they lose this right, although it is exercised by their assistants, if of European birth. In accordance with the usual practice, the Indian Government submitted the question to the local administrations for their advice. Among the provincial governors and their councils there was a general agreement of opinion in favor of removing the anomaly, and recommending the Secretary of State to sanction a bill which will give native magistrates the powers conferred upon Europeans of the same grade, except in the matter of criminal jurisdiction, which should be restricted by confining the office of justice of the peace and the power of trying European British subjects to persons who, whether native or European, have received a training calculated to fit them for the exercise of such jurisdiction in harmony with English judicial notions. The same point was raised during the discussion of the criminal procedure code in the Legislative Council in 1872.

Prior to 1872, judicial officers outside the presidency towns were not permitted to pass sentences of imprisonment on European British subjects, who were sent to a presidency town for trial by a jury before the High Court. When the criminal procedure code of 1872 was under discussion, it was proposed to abolish this privilege. The proposition to confer the jurisdiction on all superior magistrates, native and European, was negatived by a majority of two votes. A compromise was arrived at, whereby district judges and magistrates who were themselves Europeans, and justices of the peace, were granted a certain limited jurisdiction over European British subjects, and allowed to pass upon them sentences of imprisonment not exceeding one year; while the more serious offenses remained triable, as before, only by the high courts.

In presidency towns the native magistrates exercise the same jurisdiction over Europeans that they do over natives. Mr. Gupta, who had received an appointment in the Mofussil, after

discharging the duties of a magistrate in Calcutta, was the only person who would be immediately affected by the change. Another native member of the covenanted civil service might be called upon to exercise jurisdiction over Europeans in 1884. Not more than five would become eligible within five years, and very few for many years to come. Yet the introduction by Mr. Ilbert of the criminal procedure amendment bill in the Supreme Council, embodying the recommendations of the majority of the provincial officials, raised a storm of protests. The Ilbert bill proposed to empower the Government to appoint to the office of justice of the peace, with jurisdiction over Europeans, subject to the rights of appeal and trial by a mixed jury, such persons as it thinks fit from among the members of the covenanted civil service and the statutory native civil service, or from among the assistant commissioners in non-regulation provinces, or cantonment magistrates.

The opposition to the Ilbert bill was almost universal in the European community. It bore the character of a somewhat artificial agitation, fomented by the class whose prospects of power and emolument were impaired by the policy of the Government to throw open the civil service as far as practicable to natives, and to develop the principle of local self-government. The Ilbert bill offered a tangible ground for opposition which appealed to popular passion and prejudice. Its opponents made the best use of the opportunity to stir up race animosities and to provoke retorts from the native journalists and orators, who possess a talent for vituperation. The bolder and more far-seeing Indians pointed out that if the English do not allow and encourage the development of free institutions, which, with the spread of English education in India, the people had learned to understand, they would copy their European masters in establishing freedom by revolution. The impossibility of holding India by the sword was shown, and the fact recalled that it was the fidelity of Indians which rescued English power in 1857. Such expressions were cited by the Anglo-Indians to show the prevalence of the belief that the days of the English *Raj* were numbered, and that the reforms offered the Indians in the direction of self-government and the equality of the races were the outcome of fear and weakness.

The ground for opposing the Ilbert bill was that it abolished a distinction founded upon race. The specific reasons why it was unadvisable to give native magistrates power to inflict punishment on Europeans, or to decide cases between Englishmen and natives, were that the Hindoos were lacking in the sense of justice and truth innate in the English character. It was said that in the tea districts and other parts of the country natives would bring false and interested complaints against planters' assistants, railway officials, etc., supported

by perjured testimony, which is notoriously obtainable for a couple of rupees, and that the native magistrates, unskilled in the sifting of evidence and biased by race prejudice, would decide in favor of the native suitors and complainants. The effect would be to frighten English capital which was needed for the development of the country. The plain ground was taken, when the agitation was under way, that it was dangerous to abolish distinctions between the conquering and the conquered race. The privileged position claimed by the British population with such unanimity, it was agreed, was not an anomaly, since the Indian laws recognized a variety of distinctions between the different ranks, castes, and religions of the natives.

The controversy was carried on with as much warmth in England as in India. The majority of the returned Indian officials opposed the Ilbert bill. British public opinion was influenced by the weight of their authority, and to a large extent accepted their arguments. In India the demonstrations and meetings in opposition to the Ilbert bill gave rise to counter-demonstrations in its favor. By the natives Lord Ripon was praised in extravagant terms. The great majority of the English population were arrayed in opposition to the Government policy, while the natives of all ranks and classes were unanimous in favor of the Ilbert bill and the policy of which it was the index. The agitation called forth expressions of the views and wishes of the indigenous community. One of their strongest desires was that the covenanted civil service should be rendered more accessible to Indians. The uncovenanted civil service, embracing the offices of the lower grades, is free to all natives who pass an English examination. The rush for Government appointments is so great that thousands pass through the colleges and attain the degrees of bachelor of arts, bachelor of law, etc., for whom there are no places. Fully two thirds of the places in the uncovenanted civil service are already filled by natives, the rest being held by Europeans and Eurasians. The Hindoos who have received a European education, chiefly in the hope of obtaining an official appointment, are objects of contempt and derision to the English, educated or uneducated. The natives, confident of their ability to sustain any intellectual test with the English, now demanded that the covenanted civil service examinations, which open the way to the highest posts under the Government, should be held in India as well as in London; and, in order that the Hindoos may acquire sufficient familiarity with the English language, that the maximum age should be raised from nineteen to twenty-one years. The opening of the covenanted civil service to natives, the branch which leads to the superior appointments, in which enormous salaries are paid, was approved under the conservative administration of Lord Lytton also, who declared that he

looked forward to the time when the service would be largely, if not exclusively, filled by natives. The law opening the service to natives who should prepare and pass their examinations in England was considered, however, to open the gate too widely. Lord Salisbury, therefore, reduced the maximum age from twenty-one to nineteen years, ostensibly in order to give the successful candidates time to pursue their studies in the universities before entering upon the service. By this regulation the natives were almost entirely precluded from the competition, though they had been more successful than the English youth, and often came out at the head of the list in the examinations.

The excitement attending the discussion of the Ilbert bill was heightened by an incident which added fresh fuel to the animosities of race. A judge of the High Court, in deciding the question of the ownership of a family idol, after first consulting a number of Brahmans as to the propriety of such a course, ordered the object to be brought into court. A prominent native, editor of one of the principal English organs of the native party, characterized it as an act of indignity and sacrilege. The judge thereupon committed the native gentleman to prison for contempt of court, and by this action excited the indignation of the entire native community.

The agitation against the Ilbert bill induced the Government to call for another expression of views. The opinions of the officials this time were opposed to the bill unless modified. The heads of departments and judges were about equally divided; but of the subordinate officials the great majority of the Europeans were opposed to the bill, while all the natives were in its favor.

In December a compromise was arranged between the Government and the Anglo-Indian Association, whereby only native district judges should exercise jurisdiction over Europeans, who should furthermore be entitled to trial before a jury containing a majority of Europeans. This right is extended to non-jury districts, though the district magistrate be an Englishman.

INDIANA. State Government.—The following were the State officers during the year: Governor, Albert G. Porter, Republican; Lieutenant-Governor, Thomas Hanna; Secretary of State, William R. Myers; Treasurer, John J. Cooper; Auditor, James H. Rice; Attorney-General, Francis T. Hord; Superintendent of Public Instruction, John W. Holcombe. Judiciary, Supreme Court: William E. Niblack, George V. Howk, Byron K. Elliott, Allen Zollars, and William A. Woods, Justices.

Legislative Session.—The Legislature convened on the 4th of January, and adjourned in the early part of March. An important subject, which received early attention and full discussion, was that of the constitutional amend-

ments. It was finally decided by a vote in the Senate of 25 (mostly Democrats) to 23 (mostly Republicans) that the constitutional amendments favoring prohibition and woman suffrage, which were adopted at the previous session, were not legally pending, and could not be considered except as entirely new matter. The point upon which the decision was made was that the amendments were not set out in full in the journals of the last session, as provided by the Constitution, but were merely indicated by their titles.

Among the acts of this session, those for the reorganization of the benevolent institutions of the State, relating to the House of Refuge, abolishing the Soldiers' Orphans' Home at Knightstown and converting the institution into an Asylum for Idiotic Children, and the metropolitan police bill for some of the cities of the State, have been characterized as partisan. The appropriation bills failed to pass. The Senate passed sixty-four House bills, and the House passed fifty-four Senate bills. Some of the most important of these follow:

1. The decedents' estate act. All the obnoxious features of the law of 1881 have been repealed.
2. The road law of 1881 has been repealed throughout, and in its stead there is a supervisors' law. The law, as it now stands, secures work on the highways as under the law before the passage of the act of 1881.
3. The dog law, in view of the wide-spread dissatisfaction that existed under the tagging system of the law of 1881, is of importance to the owners of dogs.
4. The mechanics' lien law is also worthy of mention, as it secures more certainly than ever before in this State the wages of laboring-men in a mechanic's lien upon their employer's property.
5. An act to enable the several counties of the State to sell and dispose of lands forfeited to the State for the use and benefit of the school fund, and providing for the deficiency in said school fund occasioned by such sale.
6. An act regulating the business of express companies in the transportation of gold and silver coin and paper currency.
7. An act creating asylums in which to provide for the insane that are now scattered over the State.

Other acts are those suppressing the so-called "graveyard" insurance companies; regulating the transaction of business by express companies of the State; an act concerning foreign insurance companies; an act to declare exempt from taxation certain moneys and causes in action held by executors, bequeathed or devised to literary, scientific, benevolent, or charitable institutions; and an act to punish persons who disclose the contents of messages or conversations sent over telephone lines.

Special Congressional Election.—An election was held on the 9th of January, in the ninth congressional district, to fill a vacancy. The result was the choice of Charles T. Doxey, Republican, over Thomas B. Ward, Democrat.

Finance.—The following is from the annual statement of the State Treasurer, showing the receipts and disbursements for the fiscal year ending Oct. 31, 1889:

RECEIPTS.	
Balance in Treasury, Nov. 1, 1889.....	\$686,069 53
Transfer warrants.....	\$334,256 99
Net cash receipts.....	8,293,926 14
Total.....	\$4,386,252 63

DISBURSEMENTS.	
Transfer warrants.....	\$334,256 99
Net cash disbursements.....	8,293,963 47
Total.....	\$508,927 19

RECAPITULATION.	
Balance by funds:	
General fund overdraft, \$924 80...	
Common-school fund.....	\$3,217 22
Swamp-land.....	2,416 47
School-fund revenue.....	184,158 45
College fund, principal.....	17,681 71
College fund, interest.....	1,886 70
Unclaimed estates.....	18,874 11
Escheated estates.....	1,047 25
Excess of bids to sinking fund....	2,083 53
New State-House fund.....	824,017 06
General fund overdrawn.....	924 80
Balance in Treasury Nov. 1, 1889.....	\$508,927 19

Since the last annual report the permanent common-school fund has been increased \$70,747.79, making the total amount of the fund \$9,204,858.98, which is larger than that of any other State.

Statistics.—The agricultural production of 1882 was remarkable. The wheat area was 3,063,843 acres, and the production 46,923,643 bushels. The chief of the State Bureau of Statistics observes that the cultivation and growth of wheat has developed more rapidly than that of any other staple crop, and has more than kept pace with the population. In 1850 the product per capita was 6-80 bushels; in 1860 it was 12-50 bushels; in 1870 it was 16-51 bushels, and in 1880 had increased to 23-75 bushels per capita. The yield of other crops was proportionately large, as shown by the following:

CROPS.	Acres.	Bushels.
Corn.....	2,312,633	115,699,797
Oats.....	684,829	19,615,516
Irish potatoes.....	72,984	7,364,980

In a *résumé* of the economic statistics it is shown that in 31 counties there was a decrease in the mortgage indebtedness during 1882, and that the transfers of real estate amounted in value to over \$9,000,000.

The apportionment of common-school revenue, at the close of the year, was as follows:

Amount collected from counties.....	\$737,683 63
State semi-annual interest on non-negotiable bonds.....	117,143 49
Balance in Treasury at last apportionment.....	5,676 99
From other sources.....	11,381 97

Total.....	\$861,791 29
Amount apportioned.....	848,461 30
Amount added to shares of several counties, on account of errors in report of enumeration....	870 87

To State Normal School.....	\$10,000 00
Balance in Treasury.....	2,360 63
Total enumeration of children, 719,083.	
Per capita.....	1 18

There were filed in the office of the Secretary of State during the fiscal year ended Oct. 31, 1883, 30 articles of incorporation and consolidation of railroads, and 264 of manufacturing, mining, banking, insurance, and building and loan companies.

New insane hospitals are to be erected at Evansville and Logansport.

At the southern prison a new cell-house, with all modern conveniences and improvements, has been completed and furnished, containing cells for 400 convicts.

The total number of convicts in prison at the beginning of the fiscal year was 590, at the close of the year 548, the daily average 578. The daily average in 1879 was 624; showing a decrease in five years of 46.

Temperance.—A session of the Grand Temperance Council of Indiana was held in Indianapolis in September, with an attendance of about 200 delegates, representing 42 counties. The executive committee of the council submitted a report, reviewing the temperance work in the State, as follows:

For the past two years and more almost the entire effort of the council has been directed toward securing prohibition through the means of an amendment to our State Constitution. When the election for the Legislature was approaching, the propriety of submitting the amendment to a popular vote became a political question, and the temperance sentiment among the masses of the people was strong enough to compel the two dominant parties to commit themselves upon the issue. They were not asked to pronounce in favor of prohibition, but simply of submission of the amendment. The Democratic party pronounced against prohibition, and promised submission only as a last resort, and provided they could not defeat it beforehand. The Republican party committed itself to submission, and, although the result was the defeat of that party, the newly elected members of the Legislature were, a majority of them, favorable to our cause, and the defeat of the party can be accounted for on other grounds than that the prohibition amendment was unpopular.

The following resolution was adopted:

Resolved, That we amend our former resolution, passed in April, 1883, so as to read "that we will vote for no man for any office who is not known to be in favor of prohibition."

IOWA. State Government.—The State officers during the year were the following: Governor, Buren R. Sherman, Republican; Lieutenant-Governor, O. H. Manning; Secretary of State, John A. T. Hull; Treasurer, E. H. Conger; Auditor, John L. Brown; Attorney-General, Smith McPherson; Superintendent of Public Instruction, John W. Akers; Register of Land-Office, James K. Powers; Railroad Commissioners, A. R. Anderson, Peter A. Day, and James Wilson, succeeded by L. S. Coffin. Judiciary — Supreme Court: Chief-Justice, James G. Day; Associate Justices, Austin Adams, Joseph M. Beck, James H. Rothrock, and William H. Seevers.

The Prohibitory Amendment.—The decision of the Supreme Court, in the case of Koehler & Lange against Hill (see "Annual Cyclopædia" for 1882), was rendered January 18th. It

came to this court on appeal from the District Court for Scott county, which gave judgment for the plaintiffs for beer sold. Judge Seevers delivered the opinion, of which the essential points follow:

At a special election on June 27, 1882, the electors of the State, by a majority of about 30,000, ratified an amendment to the Constitution, which, it is claimed, had been previously agreed to by the 18th and 19th General Assemblies, prohibiting the manufacture and use of intoxicating liquors as a beverage, including ale, wine, and beer.

The question is fairly presented in the record in this case whether the amendment aforesaid had been constitutionally agreed to and adopted. The validity of the amendment, and whether the same now constitutes a part of the Constitution, depends upon the question whether the 18th General Assembly agreed to the amendment which was ratified and adopted by the electors, and whether the amendment was agreed to by the 18th General Assembly in the form and manner required by the Constitution.

The engrossed joint resolution, adopted by both Houses of the Legislature of the 18th General Assembly, and approved by the Governor, was as follows:

"No person shall manufacture for sale, or sell, or keep for sale as a beverage, any intoxicating liquors whatever, including ale, wine, and beer."

This proposed amendment was ratified by the electors at a special election held on June 27, 1882. Counsel for the plaintiff insists that the joint resolution at the time it was agreed to by the Senate contained the words "or to be used," and that it then read as follows:

"No person shall manufacture for sale, or sell, or keep for sale as a beverage or to be used, any intoxicating liquor whatever, including ale, wine, and beer."

The resolution claimed to have been agreed to by the Senate is materially different in substance from the one ratified by the electors. Counsel for the appellant do not claim this is not so, as shown by the journals, but their contention is that the enrolled resolution signed by the Speaker of the House, President of the Senate, and approved by the Governor, is a verity, and is conclusive evidence that the resolution, as enrolled, was agreed to by both Houses of the 18th General Assembly, or, if this is not so, that the preponderance of the evidence is in favor of the proposition that the resolution which was agreed to was correctly enrolled. The plaintiff contends that it is made clear and certain by an examination of the Senate journal that the words "or to be used" were in the resolution when it passed the Senate, and that the journal is the best evidence of such fact.

There is no provision of the Constitution, nor is there a statute which by implication requires that a joint resolution proposing to amend the Constitution shall be signed by the presiding officers of the two Houses. Such signing, therefore, is not essential, and may be dispensed with. There is no provision of the Constitution or statute which requires that it shall be enrolled. But there is a constitutional injunction, to say the least, that it shall be entered on the journals. In a constitutional sense the journals constitute and are the primary evidence, and the enrolling and signing, as above stated, at best are only secondary evidence, which may and can only be considered when the primary evidence has been lost or destroyed.

The journal of the House of the 18th General Assembly fails to set out or even show the substance of the substitute or amendment of the House joint resolution which had been adopted by the Senate. Such journal only sets out the original resolution which had been introduced in the House, and shows simply that the House concurred in the Senate substitute,

and therefore the House journal fails to show that it adopted the same resolution which was adopted by the Senate.

When the 19th General Assembly came to consider the question as to whether it would agree to the constitutional amendment proposed in the 18th, it did so in the following manner and form, omitting material portions thereof:

SECTION 26. No person shall manufacture for sale, or sell, or keep for sale, as a beverage, any intoxicating liquors whatever, including ale, wine, and beer.

It will be observed that the words "or to be used" are not in this resolution, and that the 19th General Assembly determined in substance that such words were not in the resolution when it was agreed to by the 18th.

We are aware of the rule which universally obtains, that a statute should not be declared unconstitutional unless it clearly appears to be so. It follows that this rule should be applied to amendments of the Constitution. Mindful of this rule, and feeling its full force, it is possibly to be regretted that we have felt forced to declare that the amendment in question, which was ratified by so large a majority of the electors, has not been constitutionally adopted.

The result is, the judgment of the District Court must be affirmed.

Judge Beck dissented.

A convention of the friends of temperance was immediately called, to meet in Des Moines on the 7th of February, for consultation. The convention adopted among others the following resolution:

Resolved, That it is the deliberate judgment of this convention that the Executive and the General Assembly should immediately take steps to put in force and effect the will of the people as expressed by the vote of the 27th day of June last, by providing by an extra session called, at as early a date as can legally be done—

1. For a submission of a prohibitory amendment to the Constitution of Iowa.

2. For such other relief by statutory law as will relieve the people and the homes of the State from the curse of the liquor-traffic.

The Governor declined to call an extra session. An application for a rehearing of the case was made to the court, on the following grounds, and was granted:

1. The 19th General Assembly had jurisdiction of the subject embraced in the joint resolution of the 18th General Assembly, proposing the amendment to the Constitution drawn in controversy in this case, including the regu-

larity of its passage, and its judgment thereon is conclusive and can not be reviewed.

2. The enrolled joint resolution of the 19th General Assembly, in the custody of the Secretary of State, is conclusive evidence of the judgment upon the regularity of the action of the 18th General Assembly relative to the amendment involved in this case, and of its own action thereon.

3. The judicial department of the State has no jurisdiction over political questions; and can not review the action of the 19th General Assembly and of the people in the matter of the adoption or amendment of the Constitution of the State.

The rehearing was had on the 8d of April, and the following days, and on the 21st the Court handed down an opinion, dissented from by Judge Beck, reaffirming its former decision.

Driven Wells.—The decision of the United States Circuit Court, rendered early in May, in the case of William D. Andrews and others against George Hovey, touched a matter of great importance to the people of the State. Numerous suits in this and other States depended on the result of this suit. These suits are brought on reissued letters patent No. 4,372, granted to Nelson W. Green, one of the complainants, under date of May 9, 1871, the original patent, No. 73,425, bearing date Jan. 14, 1868, and having been issued for an "improved method of constructing artesian wells." The decision holds the reissued patent invalid, because it is broader than the original patent, and contains matters not set out in the original. It also holds that Mr. Green abandoned his invention after he made it, and before he applied for a patent. It holds the patent void also, because wells had been put down at Milwaukee, Wis., and Independence, Ia., before the time Green claims to have made the invention, which embraced all the principles claimed in his patent. If this decision be sustained by the Supreme Court of the United States, it will relieve a vast number of farmers from the payment of royalties.

Finances.—The following statement covers the twenty-one months from Oct. 1, 1881, to June 30, 1883:

NAME OF FUND.	Balance on hand Oct. 1, 1881.	Receipts from Oct. 1, 1881, to June 30, 1883.	Total.	Disbursed from Oct. 1, 1881, to June 30, 1883.	Balance on hand June 30, 1883.
General revenue	\$91,850 51	\$2,415,838 19	\$2,507,238 70	\$2,485,679 18	\$71,550 52
Permanent school fund.....	2,266 66	1,523 00	3,789 66	3,789 66
Temporary school fund.....	40,696 98	40,696 98	40,576 93	120 01
Coupon fund.....	329 85	329 85	178 50	151 35
War and defense fund.....	\$9,377 64	\$9,377 64	\$9,377 64
Agricultural College endowment fund.....	84,104 73	21,278 02	105,377 74	9,436 38	\$9,941 36
Total	\$178,551 74	\$2,508,258 78	\$2,686,305 52	\$2,515,900 63	\$171,504 90

The appropriations made by the 19th General Assembly have all been paid as the same became payable, and the State, in every financial respect, is in better condition than at any period for the past twenty years.

All the public institutions of the State have

been, so far as their support is concerned, maintained in a manner creditable to the State, and without marked increase in cost, notwithstanding the advance in cost of almost every article necessary to their proper and comfortable support.

The Auditor estimates the receipts of the present two years, based on a two-mill State levy, at \$2,482,600, an increase of nearly \$75,000 over the previous period; and the disbursements at \$1,918,820, leaving a balance subject to general and miscellaneous appropriations of \$563,780, or a little in excess of \$500,000. The State is free from debt.

The total assessed valuation of property foots up \$440,618,880 against \$412,728,902 two years ago. There have been gains in all counties except nine. The assessed value of realty in towns in 1881 was \$55,523,683; in 1883, \$75,626,670.

The greatest general increase has been in the northwest part of the State, where the process of breaking up new farms, the importation of stock, and the immigration of population has been going on steadily. This is incident to a comparatively new country, and was to have been expected. But in some of the older counties this increase has been almost equaled. Especially is this true in the case of Polk county, where the valuation has taken a jump from \$11,000,000 to \$16,000,000.

Schools.—From about 2,400 children enrolled as pupils in the first year of the State's existence, 1847, the number has increased with the growth of the State until, by the last report, there was a total enrollment in school of 464,432; the number of teachers has also grown from 124, until 22,081 are now employed, and these exclusively in the free common schools. In like manner, the school-houses have increased from 105, nearly all built of logs, to 11,825, valued at over \$10,000,000.

In the State Agricultural College there were over 300 students during the year.

State Institutions.—Both the insane hospitals are crowded to their utmost capacity. The number remaining in the Mount Pleasant Hospital, at the close of the period, June 30, 1883, was, males, 286; females, 226; total, 472. The number at Independence at the same date was, males, 323; females, 257; total, 580; a grand total of males, 559; females, 498; aggregate, 1,052. The total number of insane in the State on Nov. 1, 1883, was 1,726, of which number 1,001 were supported in the State hospitals, 519 were in the county almshouses, 133 in private asylums, 58 at homes of relatives, and 15 confined in county jails.

The number of convicts at Fort Madison has increased slightly over the previous term; the number remaining June 30, 1883, being 878 as against 841 on Oct. 1, 1881. The Anamosa prison is still in process of construction, but has so far progressed that the convicts therein, numbering 229 at the close of the period, are well provided for in every respect. The prison will have a capacity exceeding 800.

The whole number of children at the Boys' Reform School, at Eldora, is reported at 240, those at the Girls' School, at Mitchellville, at 84.

The report of the Superintendent of the Iowa Institution for Feeble-Minded Children, at Glen-

wood, shows that the general health of the children has been remarkably good, notwithstanding the necessarily crowded manner in which they have been compelled to live and sleep. From the 24th day of May, 1882, to June 30, 1883, there were 65 children admitted, but there were, during the same period, 22 dismissed, 11 deaths, and 1 deserter, leaving in the institution 239.

The State of Iowa reports 2,314 feeble-minded children, of whom 1,960 were, in 1880, at home, neither provided for in insane hospitals nor institutions of this class.

Coal.—The State Mine Inspector estimates the coal production of Iowa for 1883 to be 3,881,000 tons, a gain of 750,000 tons over last year. About one fourth of the whole is mined in Mahaska county, and five eighths of the whole in Keokuk, Lucas, Polk, Boone, Webster, Wapello, and Appanoose counties.

Banks and Insurance.—The Governor says:

I concur generally with the views of the Auditor in respect to the growing importance of the banking interests of the State, and the necessity of placing the responsibility of the supervision thereof upon some officer who can give the requisite time thereto. The report shows the number of banks operating under State law to be seventy-six, with a capital of \$3,701,793.12, and deposits aggregating \$11,200,798.10, as against forty-two banks in 1875, with \$2,063,402.50 of capital paid up and total deposits of \$3,959,791.72—an increase nearly double, both in number of banks and amount of capital, and treble in volume of deposits. The insurance report of May, 1883, which is the last yet issued, shows that the risks written during the year in the State amounted to \$201,949,207.24, and the fire-premiums paid during the year aggregated \$3,039,349.99.

There are eighty-eight national banking institutions in Iowa, the capital stock amounting to \$7,135,000, and the individual deposits to \$16,169,064.72.

Railroads.—The report of the Railroad Commissioners for the year ended June 30, 1883, shows the total number of miles of railroad in operation in Iowa to be 7,014¹⁴/₁₀₀ miles. The commissioners estimate that the stock of these roads representing the portion of them in Iowa, added to the stock of the roads entirely in Iowa, amounts, broad-gauge roads, to \$132,895,478, or \$19,811 per mile; the narrow-gauge roads to \$1,386,991, or \$6,481 per mile. The total amount of stock reported as owned by persons living in the State is \$5,164,591.41. The total amount of taxes paid by the railroads in the State is \$830,655.67, which is 7¹⁴/₁₀₀ per cent. of the net earnings.

Party Conventions.—The Democratic State Convention met in Des Moines on the 6th of June, and adopted a platform denouncing abuses of the civil service; favoring a tariff for revenue only; opposing constitutional prohibition, but favoring a license law; favoring legislative regulation of railways; and demanding protection for American citizens imprisoned by foreign governments.

The following nominations were made: For Governor, L. G. Kinne; Supreme Judge, Wal-

ter I. Hayes; Superintendent of Public Instruction, Edgar B. Farr.

The Republican State Convention met at the same place on the 27th of June, and adopted a platform denouncing polygamy; favoring prohibition; denouncing the giving of railway-passes to public officers; favoring a protective tariff; proposing a national Department of Industry; favoring exemption from attachment of soldiers' pensions, or homesteads purchased therewith; calling for amendments to the criminal code; favoring legislation to protect miners; and approving the administration of President Arthur. Messrs. Sherman, Manning, and Akers were renominated for Governor, Lieutenant-Governor, and Superintendent of Public Instruction respectively. For Supreme Judge, Joseph R. Reed was nominated.

The Greenback State Convention also met in Des Moines on the 11th of July, and adopted a platform favoring unrestricted coinage; opposing refunding of the national debt; demanding an income-tax; favoring civil-service reform; favoring a low tariff; demanding abolition of the railroad commission; demanding equal political rights for all men and women, and favoring prohibition.

The following nominations were made: For Governor, James B. Weaver; Lieutenant-Governor, Sanford Kirkpatrick; Supreme Judge, D. W. Church; Superintendent of Public Instruction, Miss Abbie O. Canfield.

A meeting of the Iowa Woman's Suffrage Association was held in Ottumwa in October, which put forth a platform, the most important resolution of which was the following:

That the votes of women are imperatively needed to promote the interest of temperance, purity, and peace, to give woman greater self-reliance, self-respect, and personal independence, and to secure to woman a "fair day's wages for a fair day's work."

Election Returns.—The election in October resulted in the choice of the Republican ticket. The vote for Governor was as follows: Sherman, 164,141; Kinne, 139,082; Weaver, 23,089; Sherman's plurality, 25,109. For Judge of the Supreme Court the vote was: Reed, 168,325; Hayes, 141,061; Church, 21,447. For Superintendent of Public Instruction: Akers, 165,873; Farr, 138,266; Canfield, 21,928. To fill a vacancy in the 6th congressional district, John O. Cook, Fusion, was elected by a vote of 14,894 against 14,658 for Stiles, Republican. The Legislature chosen at this election will be divided as follows:

HOUSES.	Republican.	Democratic.	Greenback.
Senate.....	89	11	..
House.....	52	42	6

ITALY, a kingdom of Southern Europe, constituted in 1861, when Victor Emanuel assumed for himself and his descendants the title of King of Italy, and proclaimed the Constitution granted by his father, Charles Albert, to Sardinia in 1848. The executive power is vested

in the sovereign, and is exercised through responsible ministers. The legislative power belongs jointly to the two houses of the legislature and the King. The Senate is composed of an unlimited number of members, nominated by the King, the conditions of their nomination being the occupancy of an important office, distinction acquired in literature, science, or other honorable occupation, or the payment of 8,000 lire, or francs, in taxes annually. In the Chamber of Deputies a member is allowed for every 40,000 inhabitants. The deputies are elected under the electoral law of 1882, which introduced the *scrutin de liste*, by ballot, every citizen over twenty-one years of age who pays taxes amounting to twenty lire yearly, and can read and write, being entitled to vote. The lower ranks of officials and the ordained clergy are ineligible. Senators and deputies serve without pay. The number of senators in 1880 was 270, and the number of deputies in 1881, 508. Legislation can originate in either house, but the Chamber of Deputies has the exclusive right to vote money. The King, Humbert I, born March 14, 1844, the eldest son of Victor Emanuel, succeeded to the throne Jan. 9, 1878.

The Ministry, formed May 29, 1881, is composed as follows: President of the Council and Minister of the Interior, Agostino Depretis; Minister of Finance, Agostino Magliani; Minister of Justice and Ecclesiastical Affairs, B. Giannuzzi-Savelli, who succeeded Giacomo Zanardelli May 25, 1883; Minister of Foreign Affairs, P. S. Mancini; Minister of War, General Eduardo Ferrero; Minister of Marine, Vice-Admiral del Santo, who in November, 1883, succeeded Vice-Admiral Baron F. Acton; Minister of Public Works, J. Genala, who succeeded Antonio Baccarini, May 25th; Minister of Agriculture, Industry, and Commerce, D. Berti, successor to Carlo Miceli; Minister of Public Instruction, Giambattista Baccelli.

Area and Population.—The total area of the kingdom is 288,539 square kilometres, or 114,296 square miles. The population, as determined by the census of Dec. 31, 1881, was 28,459,628, showing an increase in ten years of 1,660,274. The density of population was 248 per square mile. The population was divided as to sex into 14,265,383 males and 14,194,245 females. The number of Protestants, as approximately determined from the declarations of ministers, was in 1881 about 62,000, of whom 22,000 were Waldenses of the Vaudois. The number of Israelites was about the same. The number of strangers at the end of 1881 was 59,956, of whom 15,790 were Austrians, 12,104 Swiss, 10,781 French, 7,302 English, 5,284 Germans, 1,286 Americans, and the rest of Russian, Greek, and other nationalities.

The number of marriages in 1881 was 280,143; births, 1,116,379; deaths, 819,435; excess of births, 296,944.

The only colonial possession of Italy is the Bay of Assab, on the coast of the Red Sea; area, 248 sq. m.; pop. in 1881, 1,800 souls.

Emigration.—Emigration was small before the establishment of the kingdom. In recent years Italians emigrate in considerable numbers to all parts of Europe, America, and other parts of the world, wherever there is a demand for laborers on railroads or similar works. They usually return with their savings to their homes. The number of emigrants in 1869 was 23,040; in 1870, 81,500; in 1871, 100,170; in 1872, 115,272; in 1873, 80,716; in 1874, 51,200; in 1875, 26,872; in 1876, 108,807; in 1877, 99,213; in 1878, 96,268; in 1879, 119,881; in 1880, 119,901; in 1881, 135,882; in 1882, 161,562. The number of Italians residing abroad in 1871 was estimated to be about 476,408. The number in the United States at that time was estimated at 70,000. The number who arrived in the United States in the year ending June 30, 1882, was 82,159; in 1882-'83, 81,792.

Commerce.—The total values of imports and exports, for each of the ten years ending with 1882, were as follow:

YEARS.	Imports.	Exports.
	Livs.	Livs.
1873.....	1,267,839,774	1,133,548,583
1874.....	1,304,994,823	985,458,582
1875.....	1,215,061,015	1,007,161,050
1876.....	1,380,147,820	1,216,921,205
1877.....	1,154,306,089	966,523,543
1878.....	1,070,802,615	1,040,789,434
1879.....	1,262,044,668	1,100,961,109
1880.....	1,224,812,701	1,130,659,312
1881.....	1,228,600,000	1,192,300,000
1882.....	1,245,400,000	1,155,500,000

The imports of grain were 81·8, the exports 77·1 million francs in value; the exports of wine, 48 millions; imports of tobacco, 25·8 million francs; exports of fruits, seeds, etc., 61·9, imports 17·6 million francs; exports of animals and animal food products, 114·2, imports 75·9 million francs; imports of coal and fuel, 64·4 millions; of metals, 83·2 millions; exports of minerals and stones, 68·3 millions; of hides, leather, etc., 15·9, imports 52·1 millions; exports of textile materials, 356·2, imports 190·4 million francs; exports of pottery and glass, 12·8, imports 9·5 million francs; imports of metal manufactures, 13·9, of machinery, etc., 41·7 millions; imports of yarns, 54·5, exports 14·5 million francs; imports of textile manufactures and articles of dress, 160·8, exports 23·9 million francs; exports of jewelry and objects of art, 87·4 million francs; imports of drugs, dyes, and chemicals, 59·1, exports 47·6 millions; exports of oils, etc., 110·5 millions.

Navigation.—The total tonnage entered at Italian ports in 1882 was 17,559,956, of which 12,419,375 tons were coasting-vessels. The steam tonnage entered was 14,111,111 tons. Of the 5,140,581 tons engaged in foreign commerce, 1,523,795 were under the Italian, and 3,616,785 under foreign flags; of the steam tonnage, included in the above, 788,664 tons were Italian, and 3,214,985 foreign; total steam tonnage, 4,003,599. The tonnage of

vessels with cargoes entered was 4,127,551, cleared, 3,352,064 tons.

The merchant marine numbered, in 1882, 7,528 sailing-vessels, of 885,285 tons, against 7,639, of 895,359 tons, in 1881; and 192 steamers, of 104,719 tons, against 176, of 93,698 tons, in 1881; total tonnage in 1882, 990,004 tons, in 1881, 989,057 tons. The number of registered mariners in 1882 was 181,381.

Railroads.—The length of railroads in operation at the beginning of 1882 was 8,775 kilometres. The receipts in 1881 amounted to 191,661,613 lire; the total cost of construction on Dec. 31, 1881, was 2,673,284,808 lire.

Post-Office.—The number of letters and postal cards that passed through the post-office in 1881 was 168,878,086; of newspapers, etc., 154,562,446; of postal orders, 4,022,308, of the aggregate amount of 503,695,138 lire. The receipts were 29,787,818 lire; expenses, 25,980,898 lire.

Telegraphs.—The length of telegraph lines, at the end of 1882, was 27,618 kilometres; of wires, 93,799 kilometres. The number of dispatches was 6,454,942. The number of private domestic dispatches was 5,190,909, against 5,015,005 in 1881; of private foreign dispatches, 521,180, against 517,599. The receipts were 12,428,102 lire; expenses for service, 7,974,982 lire; for maintenance, 186,765 lire; extraordinary expenditure, 459,000 lire.

The Army.—From 65,000 to 75,000 young men are levied annually into the standing army. The rest, as they reach military age, are enrolled in the reserve, and required to drill forty days annually. The law of June 9, 1882, increased the war effective by 100,000 men. The standing army under that law is organized into 96 regiments of infantry of the line, 12 of bersaglieri, 6 of Alpine troops, 98 companies in 87 military districts; 22 regiments of cavalry, with 5 depots; 12 regiments of field-artillery of 10 batteries, 2 brigades of horse-artillery of 2 batteries, 5 regiments of fortress-artillery of 12 batteries; 2 brigades of mountain-artillery; 4 regiments of engineers, 2 of sappers and 2 of miners, 1 regiment of pontoniers, and 1 regiment of railroad and telegraph troops; and 11 territorial legions of carbineers, besides 1 regiment of instruction. The war effective of the standing army is maintained at 690,000 men; of the mobile militia, 300,000 men; of the territorial militia, 1,000,000 men. The total strength of the army, as reported Sept. 30, 1882, was 1,985,619 men.

Italy has adopted the French plan of training the gendarmerie and customs guard in military operations and organizing them for mobilization with the army, so that in the event of war their discipline and knowledge of arms can be turned to account in the national defense. They are schooled in the use of the Vetterli rifle, and in case of mobilization will form in battalions.

The Navy.—The navy consisted on Jan. 1, 1882, of 19 ironclads, 18 screw-steamers, 6 paddle-wheel steamers, 17 transport-steamers, and 12

vessels for local service. The iron-clad navy includes the four most powerful men-of-war in the world, double-turret ships, each carrying four 100-ton guns. The Duilio and Dandolo, twin ships, of 10,650 tons, are plated with 22-inch armor throughout, and are constructed for a speed of 14 knots an hour. The Italia, of 14,000 tons, has armor 33 inches thick at the water-line, and is calculated to run 16 knots an hour. The armor-plates and armament were not completed in 1883. The Lepanto, the fourth of the colossal ironclads, was launched March 17, 1883. Her keel was laid in August, 1877. She is a sister-ship to the Italia. She measures 123 metres in length and 22½ in breadth. Her displacement is 14,500 tons. The engines, of 18,000 horse power, give a speed of 17 knots. She will carry four 100-ton guns and eighteen 4½-ton broadside-guns. The cost of this vessel was nearly \$5,000,000. Three other monster ironclads were on the stocks in 1883, the Francesco Morosini, at Venice; the Ruggiero di Loria, at Castellamare; and the Andrea Doria, at Spezzia. The first two are expected to be built and equipped before 1887. The naval project of 1875 is carried out, as far as regards monster turret-ships, by the construction of these seven vessels. The scheme was elaborated by Minister St. Bon, whose predecessor in the naval office, Ribotz, had first adopted the idea of surpassing other nations in the development of strength of armor, and size and power of guns, which was already indicated as the direction of naval progress. The Duilio, which excelled in size and strength the Inflexible and the Duperré, was begun by him in 1873. Before that time Italy had built an iron-clad fleet, which was on a par with the navies of other nations, when constructed, but was now behind the later vessels of the great powers among whom she was ambitious to maintain her place. The Terrible and the Formidabile were built in 1860, with armor 12 centimetres in thickness. The Maria Pia, San Martino, Castelfidardo, and Ancona, begun two years later, were of the same strength. The Venezia, Palestro, and Principe Amadeo, which were built after 1865, were somewhat more heavily plated, and carried a 25-ton gun in the bow, and 18-ton instead of 12-ton broadside-guns; but would not bear comparison with the more formidable ironclads with which the other naval powers were beginning to provide themselves. The announcement of the project for a fleet of seven monster ironclads, in which the Duilio was to be outdone, provoked a great deal of discussion and criticism. Many held that smaller ships, carrying guns of equal power, but with fewer in each vessel, would meet the requirements of modern warfare, and save the Government from the risk of having its naval defenses crippled by loss of any of these vessels, representing an investment of 25,000,000 francs, which is liable to be wiped out by a single torpedo. The problem it was sought to solve in

the construction of these "high-deck cruisers" is, to combine a speed and facility of evolution which renders them always prepared for attack, and room for enormous stores of coal, besides the space taken up by the engines necessary to fulfill these conditions, with armor which the most powerful projectiles can not penetrate, and guns which shall not be inferior in power and penetration to any which technical science can produce. The fulfillment of these conditions necessitates a peculiar form of construction. The Lepanto has a length of keel of 123 metres, an extreme breadth of beam of 22·28 metres, and a draught of 9·24 metres. She can take in 3,680 tons of coal, though the usual store is 1,600 tons. The four great breech-loading Armstrong guns are of 43-centimetre calibre. They are above the upper one of the two closed and armored decks in an armor-plated redoubt. The shield of the revolving turret consists of steel plates 55 centimetres thick. Of the smaller guns, 16 in a casemate form a broadside battery; the other two are on deck. The mean height of the ship's side above the surface of the water is only six metres, though somewhat higher than in the Dandolo. The iron-covered lower deck and a multitude of isolated cubical water-tight compartments secure the vessel from the danger of filling with water.

The Government have ordered, in addition to the last, two first-class ironclads of the Italia type, the construction of a torpedo-ram built on the model of the Etna, and four small cruisers of great speed, armed with light guns; also 18 sea-going torpedo-boats, capable of making 21 knots an hour, of following the squadron in all weather, and of steaming three times the length of the west coast without taking in fresh coal.

The Italian marines are now armed with repeating-rifles of the Bartoldo model. In 1880 a large sum was appropriated for naval stations and coast fortifications. The two stations of Venice and Spezzia are far advanced, and the third one, which was transferred from Naples to Taranto, at the head of the bay of the same name and fronting the coast of Africa, was begun in 1881 and is to be completed in 1889, at a total cost of 16,000,000 francs. The harbor is good, and easily defensible by fortifications on the islands at the entrance; but the navy-yard is on the Mare Piccolo, a basin connecting with the harbor by two canals. One of these is being deepened to admit vessels of war to the basin, which will constitute the naval harbor proper.

Experiments were made in the winter of 1882-'83 with the new 100-ton gun, of forty-five centimetres bore, against armor forty-eight centimetres thick, of various combinations of metal and arrangements of the plates. The penetration was satisfactory, and the ministry recommended the construction of breech-loaders of the same size and pattern for ships and coast fortresses.

Finance.—The large deficits which occurred for many years after the establishment of the kingdom, amounting in the single year of 1866 to 617 million lire, were reduced to 128 millions in 1876. Since that year there has been a surplus each year. The revenue has nearly trebled since 1861, but the expenditures have but slightly increased in fifteen years. The budget estimates for 1881 gave a surplus of 7,810,869 lire, but the actual excess of receipts in that year amounted to 50,887,288 lire; the receipts amounting to 1,518,535,464, and the expenditures to 1,467,648,226 lire. There have been large extraordinary expenditures in recent years, amounting to 678 million lire in 1882, in which year new debts figured in the extraordinary receipts for 668 millions. The total ordinary revenue of that year was stated in the budget as 1,860,842,338 lire; extraordinary receipts, 837,061,600 lire; total receipts, 2,197,904,028 lire; total expenditure, 2,179,408,868 lire.

The budget for 1888 gives the total ordinary revenue as 1,800,858,714 lire; extraordinary revenue, 149,818,962 lire; total revenue, 1,544,861,667. The ordinary expenditures are stated as 1,844,541,100 lire; extraordinary expenditures, 192,685,085 lire; total, 1,537,226,185 lire. The amount of new debts is set down as 28,151,705 lire; of sales of ecclesiastical and domanial property, etc., 24,172,005 lire. The extraordinary receipts and disbursements for the construction of railroads is stated as 89,233,807 lire.

The public debt, which stood at 2,487,000,000 lire in 1860, was increased by the deficits, which constantly recurred after the establishment of the monarchy, to 11,162,561,000 lire in 1881, of which the consolidated debt constituted 8,079,526,000 lire; the redeemable debt, at 8 and 5 per cent., 1,667,505,750 lire; the floating liabilities, represented by treasury bonds and notes, 475,529,250 lire; and the paper currency, 940,000,000. For the redemption of the paper currency a loan of 729,745,000 lire was raised in 1881-'82. Against the paper currency and treasury bonds certificates of the funded debt, to the amount of 1,150,000,000 lire, were deposited by the Government. The expenditures for interest provided for in the budget of 1883 are 526,665,577 lire, of which 437,649,883 lire represent the interest on the consolidated debt; 8,225,000 lire, the permanent dotation to the Holy See, which has been refused by the late and the present Pope, and is paid over to the ecclesiastical fund; 40,702,076 lire, interest on loans not inscribed in the *libro grande*; 83,929,495 lire, interest on various unfunded debts; and 11,159,628 lire, interest on treasury bonds and other floating liabilities. The expenditure for amortization in 1882 amounted to 3,671,584 lire.

In 1884 the tobacco monopoly reverts to state administration. In the budget estimates for 1884-'85, presented to the Chamber in November, 1883, a surplus is shown of 6,975,-

000 lire. The receipts of the treasury in 1888 exceeded those of the preceding year by more than 32 million lire.

Resumption of Specie Payments.—On the 12th of April the treasury was ready, in accordance with the law of April 7, 1881, to exchange gold or silver for the paper money, which had been the currency of the country for many years, and was only exchangeable at a large discount for French or English gold. Before the date of resumption the discount sank to a nominal figure. The Government had prepared for the resumption of specie payments by accumulating 600 million lire in gold and silver. The operation of drawing this large supply from other countries without producing a monetary crisis had been conducted with skill and forethought. The stock at first accumulated consisted of 444 millions in gold and 156 millions in silver. Through various transactions of the treasury this proportion was changed, until, on the day of resumption, the stock of metal coined in national pieces consisted of 517,222,230 lire of gold coins and 82,770,780 lire in five-lire pieces. The stock of gold originally acquired was composed of bars and foreign coins to the value of 152,981,585 lire, national gold coins to the value of 245,290,600 lire, and 45,777,795 in drafts on other countries. The 153 millions were made up of 28½ million francs in bars, 59½ millions in Russian imperials, 53½ millions in American eagles, 10 millions in sovereigns, 5½ millions in German crowns, and 1 million in Spanish coins. The largest sums were sent to Italy in 1882, viz., 238 millions of gold and 66½ millions of silver, against 150 millions of gold and 16 millions of silver in 1881. The largest supply came from France, which furnished 147½ millions, 66½ millions of French, ½ million of foreign, and 80½ millions of silver. America supplied 65½ millions of her own gold; Germany, 5½ millions of her own and 60½ millions of foreign gold; England, 59½ millions of foreign gold; Italy, 58½ millions of her own; Austria, foreign coins to the amount of 38½ millions; Russia, 25½ millions of her own gold; Australia, 10 millions of her own gold; Denmark, 5½ millions of her own gold; Belgium, 2½ millions of her own; and Spain, ½ million of her own gold. Switzerland furnished ½ million in gold and 4½ millions in five-franc pieces.

When the treasury and the agencies throughout the kingdom were opened for the exchange of coin for paper, there was a rush of people to the counters, who were actuated mostly by motives of curiosity. The actual amount redeemed, exclusive of the one and two lire and fractional notes, which were called in, was insignificant, the total for the first day being only 2½ million lire. The total amount of Government currency outstanding was 950 million lire, so that when the accumulated 600 millions are exchanged there will still be 350 millions of forced paper currency, which amount the Government intends to leave in circulation,

in denominations of five and ten francs. The 600 millions of metal are to be paid out as soon as possible, and the paper currency to that amount destroyed, an operation which will take several years.

Irredentist Demonstrations.—In seeking a good understanding with Austria and Germany, Signor Depretis was obliged, not only to renounce the political support of the Radicals, but to sustain a conflict with the large section of the people who imbibe their political ideas from France, and for the first time to resort to forcible measures for the suppression of Irredentist demonstrations. Violent articles against Austria appeared in the newspapers. The execution of Oberdank for an attempt on the life of the Austrian Emperor was made a pretext for anti-Austrian demonstrations. In December a riot took place before the Austrian embassy in Rome. In January a man was sentenced to three years' imprisonment for throwing a stone at the carriage of the Austrian ambassador. On January 4th a printer was arrested for firing with a revolver at the escutcheon over the door of the embassy. Students and professors of the universities took part in unveiling a bust of Oberdank and other demonstrations of the kind. On February 27th some paper bombs were exploded in front of the two Austrian embassies to the Quirinal and the Vatican.

Foreign Relations.—In March, Signor Mancini delivered an important speech, in which he explained his foreign policy, and confirmed the declarations of the Hungarian Premier regarding the triple alliance. He spoke of the coolness which existed previously between Italy and the Central European powers, caused by the suspicion that Italy in every European action sought to acquire some territorial accession, the notion that her army was useless except for defense, and the disquieting effect of the radical ideas of popular sovereignty and the Irredentist aspirations which were supposed to prevail in Italian politics. In the Egyptian question it was first seen that Italy and the central powers had similar interests in European politics. The refusal of Italy to join the armed intervention in Egypt on the invitation of Great Britain was justified on the ground that Italy's interests demanded adherence to the policy of opposition to the dual control and to armed intervention altogether, and to the position that the decision of Egyptian questions should become the common affair of the great powers. The attitude of Italy in this matter, and the action of the Government in regard to Irredentist demonstrations, created a favorable impression, and led to an understanding with the German powers concerning their common interests in the perpetuation of peace and preservation of the existing conditions, though not to a formal treaty. He repelled the suggestion that Italy had been refused admission to the league between the two empires, declaring that a power with 80,000,000 souls,

and a magnificent army and navy, had no need to sue for an alliance, and only offers an alliance where she is confident of its being acceptable. The informal alliance has an entirely legitimate and pacific object, and does not involve an estrangement from France, with whom Italy is connected by a community of interests and needs. One of the main points in the triple agreement is that each of the powers shall not only refrain from any hostile action, but avoid courses which would be likely to awaken distrust. The Irredentist agitation, he asserted, is based on no theory or principle; otherwise Italy would be driven to reclaim Corsica, Malta, and the canton of Ticino, as well as Trieste, and the Trentino. The Government, through the attitude taken in the triple agreement, which was a pledge of peace, hoped in time to bring about a better understanding with France, as well as to retain the sympathy of England, which power was designated Italy's constantly loyal friend. The relations with France were asserted to be improving. The treaty of commerce was concluded. In the matter of the abrogation of the capitulations in Tunis, Italy followed the course adopted by Great Britain, and reserved her definitive answer until a tangible proposal was presented, and the details of the system of courts which France wished to substitute for the consular tribunals explained to the Government. In Egyptian affairs Italy had acted in harmony with Germany and Austria, and declined to take part in the expedition, from the consideration that, if the Italian flag had floated beside the English, the French flag would have been unfolded also on the coast of Egypt, which would have led to complications. The minister denied that an alliance with Austria and Germany would be prejudicial to the free internal development of Italy. The Irredentist movement he represented as the work of misled youth or of an anti-monarchic minority, which utilizes Irredentism to create embarrassments for the Government. The Government would advance, he declared, in the direction indicated, and derive from this course augmented strength and security without any sacrifice of constitutional liberty, dignity, or independence.

Italy, as well as England, finally agreed to the abolition of the capitulations in Tunis.

The Chamber.—The new Chamber, chosen under the electoral law passed the previous session, assembled at the end of November, 1882. The Radical wing of the Liberal party was largely re-enforced through the operation of the extended franchise. The Republican and Irredentist faction was determined to exert a popular pressure on the Government and constrain Signor Depretis, if possible, to retrace the course he had taken in the direction of conservative monarchism and abandon his alliance with the Central European powers. The contest was begun in the Parliament by the refusal of a number of deputies to take the oath

of allegiance. The Premier at once brought in a bill disqualifying members who declined to take the oath, or neglected to do so, within two months after their election. Signor Falleroni, after twice refusing, was ordered to leave the chamber by the President. Upon his declining to do so, except on compulsion, he was forcibly ejected. Signor Cavalotti, before swearing allegiance in due form, on taking his seat addressed a circular to all the members of the Chamber, in which he declared that the oath for him had no significance.

Cabinet Crisis.—Since the enunciation of his programme at Stradella, Signor Depretis had commanded an overwhelming majority, made up of the Right, who accepted the programme and renounced all opposition, following Minghetti, while the other leaders retired, as well as the Left, the different sections of which were represented in the Cabinet. The only opposition was composed of the advanced sections of the Left, who, without a definite programme, coquetted with the Republican and Irredentist agitations in order to embarrass the Government, and sought to break up the fusion with the Conservatives and initiate a new era of reforms. The situation created by the alliance with Austria and Germany, and the stringent measures taken by the Government to repress Irredentist agitations, seemed to present the opportunity desired. The Government was represented to the country as suing for the alliance of Germany and Austria, and being rejected, and then finally securing admission to the league on the condition of suppressing irredentism, republicanism, socialism, and such ebullitions of popular feeling. The charge of having again degraded Italy to the condition of a vassal of Austria was more damaging than almost any that could be brought against an Italian ministry. The action of the Government in suppressing meetings and sequestering newspapers was represented as the price of the alliance. The ministry was accused of bringing pressure to bear on the judges to secure the punishment of political offenders. The Advanced Left were determined to call the Prime Minister to account. He was charged with having changed his principles within the last two years, and with pursuing the programme of the Right. Signor Depretis was equally desirous of clarifying the situation, but postponed answering the multitude of interpellations that were announced for week after week. He was not ready for a test of strength until near the middle of May. Then many of his antagonists had withdrawn and the political atmosphere was comparatively quiescent. Signor Minghetti, the leader of the Right, offered his support, and declared that the policy of the Government was a continuance of that followed by him before 1876. This declaration gave Signor Nicotera the opportunity to press the Minister President either to repudiate the interpretation and renounce the proffered support of the Right, or accept it, and thus

run the chance of alienating the entire historical Left. Signor Depretis, in his explanation, said that governments in these times have their task rendered difficult by the demand of the peoples for the too rapid accomplishment of reforms and improvements of every sort, which state of things necessitates often repose and reaction. The difficulty of preserving public peace and order was enhanced, the responsibility greater, and yet the wishes of the country must be taken account of and liberty not impaired. In this situation the Government needed the support not of a party, but of all the energies of Parliament and the country. The acts of the Government prove that they have remained true to the programme of the Left. With respect to the rights of association and of assembly, the system of constant and strict vigilance was adopted, and toward Irredentist manifestations a rigorous course was enjoined by circumstances. In extraordinary events an extraordinary responsibility must be assumed. In conclusion, he declared that his actions were not guided by the grouping of parties in the Chamber. Signor Nicotera proposed a vote of want of confidence, which he expected would separate from the Government either the Right or the pure Left. In the explanations which followed it was found impossible for the two more Radical members of the Cabinet to retain their portfolios; but the section of the party which declared against the Government was numerically insignificant. In the vote, which was taken May 18th, the majority for the Government was 348 to 29. Signor Depretis thought it best for the Cabinet to resign, so that it could be reconstituted in accordance with the somewhat more clearly defined political situation. None of the men of the Right were inclined to claim any advantage from the position, while the dissident fraction of the Left was out of the question. The Cabinet was consequently continued after waiting a week or so, Signori Baccarini and Zanardelli dropping out and being replaced by Savelli and Genala. The former, a Neapolitan by birth, was First President of the Court of Appeal at Rome, and had been made a senator in 1882, though without having taken any previous part in politics. The other new minister was a Professor of Political Economy at Florence, had sat in the Parliament, on the Left Center benches, since 1875, and had been an active member of the railroad commission. It was expected that Admiral Acton would resign with the other pronounced Liberals; he was prevailed on, however, to retain his portfolio until he laid it down in November, and was succeeded on the 16th of that month by Vice-Admiral del Santo. The new Naval Minister is one of the most distinguished officers of the Italian navy, but has never occupied himself with political affairs. When the parliamentary struggle was over, the popular agitation suddenly ceased.

Before the Parliament assembled again, on

November 26th, the old Left united in sufficient numbers to form an efficient opposition. About eighty-six deputies met and discussed a programme of which compensation for deputies and revision of the Papal guarantees formed part, while the friendly alliance with Austria and Germany was cordially approved; numbered among them were the ex-ministers Cairoli, Zanardelli, Baccarini, Nicotera, Crispi, and Doda.

Reclamation of the Campagna.—For twelve years the Government has had under consideration the project of rendering fertile, habitable, and healthful the plain surrounding Rome on all sides for a distance of from 20 to 50 kilometres. Several laws were enacted for this object, the last in 1878. This act, which originated in the Senate and was approved by the Chamber, provided for the regulation of the water-courses, which is a necessary preliminary to any attempt at fertilization and colonization. A powerful ring of aristocrats and bankers, who own the lands, and the equally powerful combination of the *Mercanti di Campagna*, who lease them for grazing purposes and derive from them with little trouble a large profit, opposed the improvement. The owners were unwilling to risk the capital necessary for the redemption of these tracts, miscultivated for thousands of years, which contained no villages or communications, were uninhabitable on account of the deadly malaria, were entirely stripped of forest, were subject to overflow from the choked-up streams, and along the coast were covered with marsh. In the session of 1888 Signor Berti, Minister of Agriculture, introduced a bill which was designed to overcome the obstacles placed in the way of the improvement. The Government is warned to press this work forward by the fact that Rome ceased to grow after the first stimulus of the transfer of the Government to the ancient capital was spent, and is outstripped in commercial and industrial activity by other cities. It is believed that when the agricultural supplies can be drawn from the surrounding district, the rural environment made attractive, and the Roman fever extirpated, the capital will take the position which is desirable for the symmetrical development of the kingdom. The new law provides for the expropriation and reclamation by the state of the *latifundia* in which the owners are unwilling to carry out the works of amelioration prescribed by law.

Interpretation of the Guarantee Law.—A ruling of the Court of Appeals, made Nov. 9, 1882, greatly limits what were supposed to be the sovereign rights and immunities of the Pope, and extends the civil and criminal jurisdiction of the courts to the Vatican. An engineer, named Martinuoli, claimed payment from the

Papal Majordomo for managing the fire-extinguishing arrangements, and of Cardinal Jacobini, as administrator of the Papal estates, for other services in the Vatican. Pope Leo XIII constituted two commissions, composed of priests, as courts of first and second instance, to pass upon these and other such claims. The suitor did not wait for the adjudication of the Papal commission, but brought an action in the civil court. The question of jurisdiction was argued on behalf of the Pope, and both the lower and the appellate court affirmed their competency to entertain the suit, which was dismissed for lack of evidence. The law of Papal guarantees, of May 18, 1871, was defined as applying simply to the exercise of the spiritual authority of the Pontiff, and as guaranteeing only such personal immunities and sovereign rights as appertain to his dignity and as were designated by Mancini "purely rights of honor."

The Ischian Earthquake.—The calamity in the island of Ischia was the most severe that Italy has experienced in many years, and cast a gloom over the country during the summer months. About 3,000,000 francs was collected in aid of the sufferers, besides what was done by the Government. The total number of deaths was stated in the official report to be 1,990. The number injured was 874. At Casamicciola, 625 strangers were killed and 922 natives. At Forio, 805 were killed; at Lacco Ameno, 128. (See EARTHQUAKES AND VOLCANIC DISTURBANCES.)

Geodetic Conference.—The seventh International Geodetic Conference met in Rome, October 15th. Resolutions were adopted in favor of the unification of time by adopting a universal hour and the unification of longitude by adopting a common initial meridian. The prime meridian for reckoning longitude recommended by the conference is Greenwich. It is proposed to count longitude in a single direction, from east to west, both by the ordinary divisions of degrees and by hours and minutes. For railroads, steamships, posts, and telegraphs, it is recommended to adopt a universal hour side by side with local or national hours. For the point of departure for cosmopolitan time the instant of midnight at Greenwich is proposed. Resolutions in favor of the application of the decimal system in the divisions of time and of the quadrant, and of the speedy adoption by Great Britain and other countries of the decimal system of weights and measures, were adopted later. The proposal for the unification of longitudes and hours originated with the United States Government, which was represented at the conference by Messrs. Stillgard and Peirce, of the Coast and Geodetic Survey.

J

JAPAN. (For details relating to area, territorial divisions, the dynasty and members of the imperial family, see the preceding two volumes of the "Annual Cyclopædia.") The census finished Dec. 31, 1882, stated the population to be 36,700,110; 18,598,998 being males, and 18,101,112 females. The population inhabited 7,811,770 houses.

The city of Tokio had, in 1881, 828,557 inhabitants; Osaka, 298,686; Kioto, 289,425; Nagoya, 118,450; Kanagawa, 107,624; and 46 cities had between 20,579 and 78,104 souls.

The government is constituted in part on European models, the Mikado ruling in accordance with the counsels of his regularly appointed advisers. These are the ministry which was established in imitation of European cabinets—the Council of State, of an indefinite number of members; and the Senate, composed of thirty-two members, most of whom are persons who have filled high posts. The Secretary of Legation and *chargé d'affaires ad interim* at Washington is Takahira Kogoro, and the Consul at New York, Takahashi Shinkichi.

The United States Envoy Extraordinary and Minister Plenipotentiary to Japan is Hon. J. A. Bingham, and the American Consul-General at Yokohama, T. P. Van Buren.

Army.—The army comprised in 1883: The guard—two regiments of foot; one squadron of cavalry, and one artillery division of two batteries; the line—14 regiments of foot; two squadrons of horse, and nine artillery divisions, each of two batteries; nine companies of engineers and six platoons of attendants. The total strength of the army on Jan. 1, 1883, was 119,828 men, including 80 generals, 9,385 officers, 109,496 non-commissioned officers and soldiers, 258 officers of the administration of the army, 62 workmen, and 647 cadets.

Instruction is given by a military academy, a military school, a school for instruction in marksmanship and gymnastics, a veterinary school, and a practical engineers' school.

Navy.—The fleet is composed of 81 vessels, with a joint armament of 196 guns, consisting of five ironclads; one turret-ship and three corvettes; 21 steamers and five sailing-vessels. The fleet is manned by 5,551 men.

Finance.—The public indebtedness of Japan, on July 1, 1882, was as follows:

Internal debt bearing between 4 and 10 per cent. interest.....	\$396,048,801
Internal debt bearing no interest.....	8,774,560
Paper money.....	106,689,288
Total	\$511,512,649
Foreign debt, new 7 per cent. loan.....	2,309,088
Total debt	\$513,821,737
Less reserve fund.....	\$56,854,808
Other assets.....	14,652,918
	<hr/>
Net indebtedness	\$442,314,837

The revenue and expenditure during the fiscal year ending June 30, 1883, were as follow:

INCOME.	
Duties.....	\$2,600,880
Real-estate tax.....	42,945,658
Mining-tax.....	15,159
Tax on northern products.....	1,358,880
Liquor-tax.....	10,512,806
Tobacco-tax.....	848,674
Stamp-tax.....	3,907,355
State revenue from mines.....	548,468
State revenue from railroads.....	989,667
State revenue from telegraphs.....	28,624
State revenue from the Mint.....	480,500
From other sources.....	3,352,968
Total	\$66,814,139
OUTLAY.	
Interest on debt and sinking fund.....	\$23,298,204
Civil list and appanage.....	1,898,785
Pensions.....	449,379
State Council.....	682,232
Senate.....	178,500
Department of Foreign Affairs.....	195,210
" the Interior.....	459,225
" Finance.....	669,899
" War.....	8,605,872
" the Navy.....	2,161,699
Other departments.....	4,521,806
Other expenses.....	28,218,488
Total	\$66,814,139

The great difficulty the Government has to grapple with is the outstanding paper money. Since September, 1883, the Government has been selling \$600,000 of bonds a month at 75 per cent., and with the proceeds has withdrawn and canceled paper money; but the remedy is not adequate. On April 26, 1882, the paper money in circulation was worth \$81,000,000 in the open market; in January, 1883, \$109,000,000; and in April, 1883, \$96,000,000. In order to intimidate the usurers and speculators, some money-brokers speculating on the fluctuations in the gold premium were arrested in Osaka because they were trying to spread a panic, but such measures have for the time being only rendered matters worse.

In spite of the monetary and financial crisis, and the restricted dealings of the banks and many failures in business, banks on the whole paid good dividends in 1883; thus, the First National Bank declared a dividend of 9 per cent., the Second National Bank 10 per cent., and the Specie Bank 4 1/2 per cent.

Treaty with Corea.—The treaty of commerce between Japan and Corea was published in November, 1883. Corean trade has developed very considerably in Japan of late years. Contrasted with that between Japan and any Western nation, except perhaps England, the direct trade with Corea figures to great advantage, being larger than the combined trade of Japan with Germany, Russia, Italy, and Holland.

Postal Service.—There were in operation in Japan on July 1, 1882, altogether, 5,169 post-offices, and they had dispatched during the twelvemonth 44,729,699 letters, 29,588,986

postal-cards, 2,852,511 Government messages, 18,671,570 newspapers, 952,870 samples and books, 174,646 newspapers to go by the foreign mails, and 1,008 registered letters to go abroad; together, 96,916,235 items of mail matter, against 88,294,010 the previous year. Postal orders were paid out to the amount of \$3,521,459. The receipts were \$1,660,896, and the expenses \$1,470,918.

Telegraphs.—In January, 1882, there were in operation 112 offices, and they had forwarded during the year 1881, altogether, 1,272,756 messages. The length of line was 8,929 miles, and that of wire, 9,345.

Railroads.—On July 26, 1883, the first section of the Great Central railroad was opened to traffic between Tokio (Yeddo) and Koumagai, the distance between the two points being 38 miles. The Great Central is intended to traverse the island of Nippon throughout its entire length. Soon the locomotive will reach Tagasaki, one of the chief cities in the Japanese silk-region; thence the line will extend to Aomori, the northern extremity of the island. The country through which the first section, above alluded to, passes, is extremely fertile, and it abounds in resources of all kinds. The stations of wood have been cheaply constructed, and all the rolling-stock, with the sole exception of the locomotives, is of Japanese build.

The railroads in operation in Japan on Jan. 1, 1884, were the following: from Yokohama to Tokio, 18 miles; from Kobé to Otsu, 58 miles; from Trourouga to Sekigahara, 41 miles; from Tokio to Koumagai, 38 miles; together, 155 miles. There was then being built the line from Tokio to Mayebashi, 81 miles. The first three lines named are Government property; the remainder is owned by a company.

Good roads being few in Japan, traffic suffers from the high freight which the forwarding of goods on the backs of horses and mules involves. Japan declared in 1883, through its Minister of Foreign Affairs, that it was ready to throw open internal trade to foreigners, provided they submit to be held amenable to local legislation; but this would necessitate the revision of treaties, and can not be accomplished without considerable delay.

Prussian Administrators.—Following the example of the Sublime Porte, Japan has asked the Government of Prussia for three officers to be employed in the management of affairs in the interior. They are to bear the same rank and title as members of the Japanese Council of State, and receive a salary equal to that of a cabinet minister in a German kingdom.

Instruction.—The Minister of Public Instruction in Japan published in 1883 his sixth annual report, according to which there were then 26,594 schools, 25,395 of which were public and 1,190 private; increase in the year, 1,115 public and 112 private; together, 1,225 more than in 1882. There were 65,612 teachers, 63,305 of whom were in public and 1,807

in private schools. Increase in the former during the year, 5,702, and the latter, 85; together, 5,787. Number of pupils attending public schools, 2,208,633, and private, 64,541, being an increase of 112,505 in the former, and a decrease of 2,243 in the latter. Increase of pupils attending superior schools, 8,496, and of such institutes, 190; of professors, 861.

Several military men left France for Japan in 1883, to be attached as instructors to the superior military academy.

Merchant Marine.—Japan made great efforts in 1883 to establish a steam merchant navy. Five steamships, three wooden and two iron, were purchased in Japan in that year, at a cost equivalent to £82,000. They have a joint carrying capacity of 4,150 tons, and have since been engaged in the coasting trade for passengers and cargo. In addition to these, Admiral Ito, assisted by two English nautical men, made contracts with eminent ship-builders on the Clyde and Tyne for sixteen steel and iron steamships, having a joint dead-weight carrying capacity of 22,540 tons. They are to be constructed upon the most approved principle, being built under Lloyd's special survey, and classed 100 A 1. Their cost in Japan, with spare shaft and other gear, and very full and complete specifications, will be £450,000, or somewhat under £20 per ton. Two of them will have a speed of thirteen knots when laden, and will carry two large Krupp guns, magazines, etc. Two other vessels will have twelve-knot speed, laden; the remaining vessels being ten-knot steamers, guaranteed. There are to be three 700 and two 800-ton ships, the rest being from 1,150 tons up to 2,500 tons. Two of this new fleet were already in the Japanese coasting trade in November, 1883; another sailed from Glasgow on October 23d; and all will be at their destination by October, 1884. In addition to these twenty-one steamships belonging to it, the "Union Steam Navigation Company" chartered in November, 1883, three steamships from the Government, making a total of twenty-four steamers, of 28,065 tons burden, eleven of which were then running on the coast of Japan. The charter of this company prohibits the acquisition of any but new steamers; but it was permitted to purchase twenty-two sailing-vessels, of 7,000 tons aggregate, belonging to Japanese owners. The Government subscribed \$2,600,000 of the capital stock to the company, \$3,400,000 being subscribed by over 5,000 merchants.

Cabinet - Woods.—Seven magnificent sorts of cabinet-wood, growing abundantly in the forests of Japan, are expected to enter the world's markets as soon as the railways reach the districts where they are found, which will be at no distant day. They are the sugi (*Cryptomeria Japonica*), the ichii (*Tasus cupidata*), the hinoki (*Chamaecyparis obtusa*), the servara (*Chamaecyparis pisifera*), the tsudiakudan (*Thuya*), the benibiakutan (*Juniperus Japonica*), and the kiri (*Paullownia imperialis*).

Silk.—Yokohama silk-merchants resolved in 1883 to found in that port a silk-conditioning establishment, after the Lyons (France) pattern, at a cost of \$30,000, an experienced inspector to be engaged in France, and to receive \$1 per bale inspected. The Government

has been asked for aid to the extent of \$511,000, to be spent in premiums to be awarded to the producers of the best silk.

Commerce.—The ensuing tabular statement exhibits the foreign-trade movement in Japan during 1882:

	Yokohama.	Higo and Osaka.	Nagasaki.	Hakodadi and Niigata.	Total.
Imports.					
Cotton goods	\$8,618,000	\$2,371,000	\$52,000	\$10,941,000
Woolens	1,008,000	917,000	7,000	1,927,000
Cotton and wool mixed	858,000	161,000	1,114,000
Metals	1,049,000	717,000	80,000	1,846,000
Sundries	5,521,000	2,662,000	752,000	\$5,000	9,048,000
Asiatic products	3,106,000	1,156,000	266,000	4,522,000
Merchandise	\$20,852,000	\$7,886,000	\$1,187,000	\$8,000	\$29,408,000
Specie	6,060,000	5,987,000	100,000	10,147,000
Total	\$26,912,000	\$11,873,000	\$1,287,000	\$8,000	\$39,550,000
Exports.					
Raw silk	\$17,661,000	\$1,000	\$17,662,000
Silk-worm eggs	122,000	122,000
Tea	4,472,000	2,471,000	\$55,000	7,028,000
Copper	257,000	599,000	2,000	848,000
Tobacco	68,000	16,000	12,000	96,000
Vegetable wax	9,000	801,000	22,000	822,000
Campbor	1,000	612,000	254,000	867,000
Coal	26,000	1,150,000	1,176,000
Dried fish	264,000	828,000	573,000	\$126,000	1,908,000
Rice	20,000	858,000	772,000	1,650,000
Sundries	3,807,000	1,548,000	433,000	878,000	6,171,000
Total	\$26,676,000	\$6,750,000	\$3,208,000	\$504,000	\$17,288,000
Specie	4,701,000	2,119,000	77,000	6,897,000
Total	\$31,377,000	\$8,869,000	\$3,285,000	\$504,000	\$44,185,000

In 1882 Yokohama exported silk, 2,585,069 pounds, against 1,801,180 in 1881; tea, 14,215,768 pounds, against 14,980,894; and imported twist, 20,222,208 pounds, against 24,587,210 in 1881; and woolens, 5,221,402 yards, against 8,147,599 yards; cotton goods, 42,584,296 yards, against 29,775,592; petroleum, 9,007,925 gallons, against 4,616,855; and sugar, 48,140,026 pounds, against 41,062,918.

AMERICAN TRADE WITH JAPAN.

FISCAL YEAR.	Imports from Japan into the United States.	Domestic exports from the United States to Japan.
1880	\$14,510,884	\$2,525,758
1881	14,317,600	1,440,146
1882	14,489,495	2,584,265
1883	15,098,890	3,375,885

While the general import from Japan into the United States, and particularly of tea, has been on the whole steady, that of raw silk has doubled in a few years. The domestic export to Japan has fluctuated widely, because the Japanese market is easily overloaded with merchandise of all kinds from all quarters, causing at times a sudden check to importation, on account of heavy losses in Japan on imports. American goods have not been exempt from these influences. Instead of merchandise, the United States shipped, in 1881, \$2,468,535 specie, to pay for tea and silk; the next year only \$453,362 specie, because it was then more profitable to ship goods on a bare market.

JEWELL, Marshall, an American merchant and statesman, born in Winchester, N. H., Oct. 20, 1825; died in Hartford, Conn., Feb. 10, 1888. His father was a tanner and currier, and Marshall, after receiving a fair education, became an apprentice in his establishment. Thence he went to Boston, where he studied electricity, especially in its application to telegraphy. After leaving Boston, he became a telegraphic operator in Rochester, N. Y. Being of a somewhat roving disposition, he went next to Akron, O., thence to Columbia, Tenn., and thence to Jackson, Miss., when, at the age of twenty-three, he superintended the construction of telegraph lines between Louisville and New Orleans. The next year, 1849, he became general superintendent of the New York and Boston Telegraph lines, but gave it up in order to join his father in manufacturing leather belting at Hartford. The business prospered, and on the death of his father, not long after, he became head of the firm of Marshall Jewell & Co.

In 1859 Mr. Jewell visited Europe and made a careful inspection of the tanneries in England and France. He repeated his visit the following year, and with good results. Going abroad again, in 1865, he occupied a year in traveling, including a trip to parts of Asia and Africa.

Mr. Jewell's political career was begun in 1868, at which time he was a candidate for Governor of Connecticut, on the Republican ticket. He was elected, and served from May, 1869, to May, 1870. He was elected a

second time, and served from May, 1871, to May, 1872. Still a third canvass in his favor was successful, and he served another year. Immediately upon the close of his third term, in 1873, he was appointed by President Grant United States Minister to Russia, where he was of great service to American interests. Discovering that frauds were practiced, in imitations of American manufactures (as sewing-machines, scales, axes, etc.), he negotiated with the Russian Government a trade-mark treaty, and carried it through to completion. He also investigated the process by which "Russia leather" is produced, and ascertained that the peculiar scent which this leather has is obtained by the use of birch-bark tar in tanning. The result has been that this kind of leather is now manufactured in the United States as successfully as in Russia.

In July, 1874, he returned home and was appointed Postmaster-General. He began at once a policy of reform against notorious "straw bids" and other corrupt practices in Texas and Alabama, and succeeded in suppressing a number of these. He established fast mail trains, and avowed his determination to conduct the department on proper business principles, as he or any other upright merchant would do in his own affairs. The "ring" politicians were active against him, and finally succeeded in their efforts; so that, early in July, 1876, the President demanded his resignation.

He returned to Hartford, and devoted himself again to business. He was placed at the head of the Republican National Committee, was very earnest and efficient in discharging its duties, and spoke frequently to large meetings in the Garfield campaign. Besides the business of his own firm, he was interested in numerous other enterprises with his brothers, and held posts of trust in several banks, insurance companies, etc. He was a Congregationalist from early life and retained his communion with that denomination to the last. He entertained a deep and sincere hatred of slavery, and during the civil war he gave all his influence, and expended freely of his means, to support the Union.

In 1852 he married Esther, daughter of William Dickinson, of Newburg, N. Y., who, with two daughters, survives him. He was a man of fine personal appearance, an able speaker, and of genial spirit and manners. His health was always good, and he had hardly known by personal experience what sickness was. He died of acute pneumonia.

JORDAN CANAL. See **ENGINEERING.**

JUTE AND JUTE-BUTTS. The jute and jute-butts received in this country from India and China are the fibers of two Indian annuals of the order *Tiliaceae*, *Corchorus capsularis* and *C. olitorius*. What is imported here under the name of "Mexican jute" is not the fiber of any species of *Corchorus*, though it probably belongs to an allied family. The jutes differ from what is known commercially as "hemp"

in the soft and woolly character of the fiber, its ability to absorb moisture readily, its inferior strength, and the difficulty of bleaching it without destroying the tenacity and durability of the goods made from it. Still, for many purposes it is valuable. The Indian jute

JUTE (*Corchorus capsularis*).

is cultivated on the lower lands along the Ganges and elsewhere in India, flourishing best in a rich alluvial soil and in a hot, moist atmosphere, with a heavy rainfall. In 1872 there were 921,000 acres of it under cultivation in India. The acreage has since undoubtedly increased materially, as the export demand is constantly enlarging, that of Great Britain and the United States alone having nearly doubled in ten years, and the number of manufactories of gunny-bags and other jute goods in India having greatly multiplied. In India the jute grows to the height of from five to ten feet, and the stalks are of the thickness of a man's finger. The plant is utilized in many ways. The tops serve for pot-herbs, the leaves for manure, the stalks for fences, the seed for oil-cake, the butts and roots for cheap bagging and paper, and the inner bark for fiber. It has been long and successfully cultivated in China, and attempts have been made to acclimatize it in Algiers, in Mississippi and Louisiana, in Australia, and in England. In the last two countries the attempt has been unsuccessful; in the former, on account of the uncertainty of the rainfall, in the latter from the coolness of the climate. It may be safely said that no climate where the mean temperature of May, June, July, and August is lower than 68° Fahr., and the rainfall for the same months less than twenty inches, can be sure of a uniformly successful crop of jute.

Mississippi, Louisiana, and indeed the Gulf States generally, seem to fulfill these conditions, and may be considered suitable ground for the cultivation of this crop. Mississippi has made a successful beginning. It has been as-

certained, by repeated experiment, that on good lands at least one ton of fiber of the best quality, worth at the plantation not less than four cents a pound, can be produced from an acre at a cost of not more than \$18 for cultivation; while the cutting, hauling, decorticating, washing, and baling of the fiber, on an estimated yield of fifteen tons of green stalks to the acre, can be done in the best way at a cost of less than \$80 an acre, the net yield being a full ton of fiber prepared for use.

These processes are conducted by American machines recently invented, and tested in the field, by means of which three persons perform more labor in a day than 160 Hindoo laborers who strip and wash the fiber by hand. This estimate of a cost of \$43 to the acre, against a value of \$80 for a ton of the fiber, is claimed to be excessive, but it leaves a net profit of \$37 to the acre. To this are to be added the value of the leaves for manure, of the seed for planting and for oil-cake, and of the butts and roots for cheap bagging and paper. Our manufacturers are importing these jute-butts at not less than \$85 a ton, and the yield would be more than a ton to the acre. The manufacturers pay from \$95 to \$100 a ton for the best India jute, and the quality produced in Mississippi is acknowledged to be superior in every respect to the best imported.

For the total export from India and China we are obliged to go back about ten years, though we know that there has been a great increase both of production and export since that time. In 1872-'73 the amount exported was 354,046 tons, of which Great Britain took 197,773 tons, and exported 87,752 tons of this amount, reserving 160,000 tons for her own use. In 1880 the export to Great Britain had reached 295,329 tons, valued at \$21,850,160. In the same year there were imported into the United States—the greater part from India, but some also from China and Mexico—82,471 tons, valued at \$5,075,945. If the other countries which took jute direct from Calcutta in 1872 had increased in anything like the same proportion, the total export from India must have been at least 550,000 tons, and the value nearly \$50,000,000. The export from China, at one time very considerable, has within a few years nearly ceased. That from Mexico has increased, and in 1882 its export to the United States alone was 19,233 tons, worth, at the custom-house valuation, \$2,061,939. The entire import into the United States in that year was 84,186 tons, having a custom-house valuation of \$4,710,192; a large portion being butts, 58,198 tons, valued at \$1,965,644, against 80,988 tons of jute of a value of \$2,744,548.

The jute is used for burlaps, for the finer qualities of bagging, for twilled and other stair-carpeting, for what is known as "wool-twine," and as an adulterant of the lower-priced broad-cloths, the so-called "Japanese silks," for imitations of Irish linen and of low-priced French silks, and for admixtures in all the finer car-

pets—Axminster, Kidderminster, Brussels, and Venetian. It takes colors very readily, and exhibits the most brilliant dyes for a time, but they are not permanent. In Dundee, Scotland, there are about 100 jute-mills, employing 20,000 workmen and manufacturing 90,000 tons of jute annually.

But, large as is the consumption of jute both here and in Europe, that of jute-butts (the lower portion of the stalks and the roots of the jute-plant) is still greater. Our importation of jute-butts in 1882 was more than 53,000 tons. Twenty years ago these were not considered of any value. The manufacturers of jute in India, who received from the cultivators the whole plant (except perhaps the leaves and tops), found the butts so much of a nuisance that they compelled their hands to carry a quantity of them home every day and burn them. At last, about 1866, a captain of an East India ship, finding himself at Calcutta without a full return cargo, was induced to take on board eighty or ninety tons of this worthless stuff as ballast. On arriving at New York he told a friend, who was a rope-maker, of his ballast, and induced him to take it off his hands and experiment with it for a coarse paper-stock. The experiment was successful, and it was found that it could be spun also into a yarn, from which a coarse bagging could be made; and a demand was created for it. That rope-making firm, L. Waterbury & Co., of Brooklyn, N. Y., now use 9,000 tons annually, and with the other firms in the same line of business in that city consume 16,000 tons of jute-butts, almost a third of the whole importation, all of which is used either in the production of cotton-baling cloths or the so-called "Manila" paper. The same firms and some others in that city use nearly 10,000 tons of jute. Here may be mentioned a singular blunder of the census of 1880. The importation of raw jute and jute-butts in that year was 82,471 tons, and its value (custom-house valuation) \$5,075,945. To any one who has any idea of the relation of our importation of raw materials to our manufactures, it must be evident that this large importation was brought to our ports for the purpose of being manufactured; yet the census of 1880 reports that the entire manufacture of jute and jute goods in the United States was only \$696,982, and that the raw material used was but \$447,094, only about one twelfth of the amount imported. Of these amounts, \$415,788 of raw material, and \$650,560 of finished product, were said to be used and produced in the State of New York, and all of this in the city of Brooklyn. At that time a single firm in that city were producing from jute-butts \$1,044,000 worth of bagging and paper, and from jute about \$600,000 more, and the whole production of jute bagging and jute goods in that city alone was more than \$2,600,000, while the cost of the raw material was nearly \$2,000,000. There can be no doubt that the entire amount

imported was consumed; for in 1881, 1882, and 1883 the importation was still greater in quantity, though the proportion of the cheaper jute-butts was increased and there was a consequent falling off of values. Raw jute has always been subject to a considerable duty, usually about \$15 a ton (under the new tariff, 20 per cent. *ad valorem*, which is about \$18); but jute-butts were admitted free till 1876, when a duty of \$6 a ton was placed on them,

and this was reduced to \$5 by the new tariff. That both jute-butts and jute can and should be produced here seems evident, in view of the facts mentioned and the rapidly-growing demand for them for so many kinds of manufactures. At this time, the bagging for the entire cotton-crop of the United States is made from jute-butts; and all the so-called "Manila" wrapping-paper is made from the same material.

K

KANSAS. State Government.—The following were the State officers during the year: Governor, George W. Glick, Democrat; Lieutenant-Governor, D. W. Finney; Secretary of State, James Smith; Treasurer, Samuel T. Howe; Auditor, E. P. McCabe; Attorney-General, W. A. Johnston. Judiciary, Supreme Court: Chief-Justice, Albert H. Horton; Associate Justices, David J. Brewer and D. M. Valentine.

Legislative Session.—The Legislature convened on the 9th of January, and adjourned on the 8th of March. On the 23d of January, Preston B. Plumb, Republican, was re-elected United States Senator by a vote of 38 against one in the Senate, and 89 against 34 in the House. There were passed 167 bills, of which the Governor signed 162, vetoed four, and allowed one to die in his hands. One of the vetoed bills was passed over the veto. Among the acts passed were the following:

An act to provide for the health and safety of persons employed in and about coal-mines; an act declaring drunkenness a misdemeanor and prescribing punishment; an act relating to the issue of stock by corporations; an act forming new congressional districts; an act concerning railroads and other common carriers.

The railroad law provides for three railroad commissioners, who have power to examine the books and papers of the corporation and its officers under oath. Some of the more important provisions of this act follow:

No railroad company shall charge or receive a rate in excess of three cents per mile for the transportation of any passenger who is over twelve years of age, nor in excess of half that sum per mile for the transportation of any passenger of the age of twelve years or under.

The commissioners shall have the general supervision of all railroads in the State operated by steam, and all express companies, sleeping-car companies, and all other persons, companies, or corporations doing business as common carriers in this State, and shall inquire into any neglect or violation of the laws of this State by any person, company, or corporation engaged in the business of transportation of persons or property therein, or by the officers, agents, or employes thereof, and shall also, from time to time, carefully examine and inspect the condition of each railroad in the State, and of its equipment and the manner of its conduct and management, with reference to the public safety and convenience. Whenever in the judgment of the railroad commissioners it shall appear that any railroad corporation or other transportation company fails to comply with the terms of its charter or the

laws of the State, or whenever, in their judgment, any repairs are necessary upon its road, or any addition to its rolling-stock, or any addition to or change of its stations or station-houses, or any change in its rates, or any change in the mode of operating its road and conducting its business, is reasonable and expedient, said commissioners shall inform such corporation of the improvement and changes which they adjudge to be proper.

The commissioners shall, on or before the first Monday in December in each year, make a report to the Governor of their doings for the preceding year and of the condition of every railroad in the State, as to capital stock, value of property, indebtedness, condition of track and machinery, etc.

No railroad company shall charge, demand, or receive from any person, company, or corporation, for the transportation of any property or for any other service, a greater sum than it shall at the same time charge, demand, or receive from any other person, company, or corporation, for a like service from the same place, or upon like condition and under similar circumstances.

It shall be unlawful for any railroad company to make any contract or enter into any stipulation with any other railroad company running in the same general direction, by which either company shall directly or indirectly agree to divide, in any manner, the joint earnings upon freight transported.

Statistics.—The State had in 1872, 2,476,862 acres of land in cultivation; in 1882, 11,043,399 acres, an increase of 8,566,517 acres. The live-stock of the State in 1872 was valued at \$30,013,898; in 1882 it had increased to \$83,874,539, or a permanent increase of wealth of \$53,860,641. Four fifths of the area are still uncultivated.

In 1888 the product of winter wheat was 28,958,884 bushels, with an average yield of 19'56; spring wheat, 1,066,052 bushels, with an average yield of 18'47; total, 30,024,936 bushels, and an average yield of 19'25 bushels per acre. This is within 5,000,000 bushels of the great crop of 1882.

The average yield of rye per acre was 18'79 bushels, and the total product 5,084,891 bushels. The corn-crop amounted to 182,084,526 bushels, an average of 89'13 bushels an acre.

The State Board of Railroad Commissioners have obtained an official statement of the amount voted, in cash and bonds, by the several counties of the State, to aid in building railroads. The total is \$9,504,385.

The last report of the State Board of Railroad Assessors shows that there are 4,315 miles of railway in Kansas.

Farmers' Convention.—The Kansas State Farm-

ers' Alliance met in January, and put forth resolutions declaring that the farmers were oppressed by the railroads and other corporations; calling for the passage of a law fixing a schedule of freight and passenger rates; and denouncing the railroad-commissioner system.

Temperance.—The Kansas State Temperance Union met in January, and adopted resolutions declaring that the State had no moral or legal right to license any wrong, but should enact only such laws as will promote what is right and prohibit what is wrong; that the prohibition of the sale of intoxicating liquors as a beverage is a great moral question, and is right in principle and in practice; and that there should be no attempt by the Legislature to strike prohibition from the Constitution by re-submitting an amendment for that purpose, or the repeal or emasculation of the law already enacted for the enforcement of it.

KENTUCKY. State Government.—The following were the State officers during the year: Governor, Luke P. Blackburn, succeeded by J. Proctor Knott, Democrats; Lieutenant-Governor, James E. Cantrill, succeeded by J. R. Hindman; Secretary of State, James Blackburn, succeeded by James A. McKenzie; Treasurer, James W. Tate; Auditor, Fayette Hewitt; Superintendent of Public Instruction, J. D. Pickett; Attorney-General, P. W. Hardin; Register of Land-Office, Ralph Sheldon, succeeded by J. G. Cecil; Commissioner of Agriculture, Charles E. Bowman, succeeded by John Davis; Insurance Commissioner, L. C. Norman. Judiciary, Court of Appeals: Chief-Justice, T. F. Hargis; Associate Justices, Thomas H. Hines, William S. Pryor, and Joseph H. Lewis.

Party Conventions.—The Democratic State Convention met in Louisville on the 16th of May. The following ticket was nominated:

For Governor, J. Proctor Knott; for Lieutenant-Governor, J. R. Hindman; for Attorney-General, P. W. Hardin; for Auditor, Fayette Hewitt; for Treasurer, James W. Tate; for Superintendent of Public Instruction, Joseph Desha Pickett; for Register of the Land-Office, J. G. Cecil.

The platform declared for revenue reform, revision of the State Constitution, and encouragement of immigration.

The Republican State Convention met in Lexington on the 23d of May, and nominated the following ticket:

For Governor, Thomas Z. Morrow, of Pulaski county; Lieutenant-Governor, Speed S. Fry, of Boyle county; Attorney-General, Lewis C. Garrigus (who served in the Confederate army), of Logan county; Auditor, Leroy R. Hawthorne, of Campbell county; Superintendent of Public Instruction, J. P. Pinkerton, of Carter county; Register of the Land-Office, the Rev. J. W. Asbury (colored), of Cynthiana county; Treasurer, Edwin Farley.

The resolutions adopted declared for free schools for all the children in the State; adjustment of the tariff; amendment of the State Constitution; encouragement of immigration; and repeal of the tobacco-tax; arraigned the

Democratic State government for practically nullifying the criminal and penal laws, and for the bad condition of the prison and charitable institutions; and commended the administration of President Arthur.

Election Returns.—At the election in August, the Democratic ticket was successful, Knott receiving 133,615 votes, and Morrow 89,181. The following table gives the vote for the other officers:

	Democratic.	Republican.
Lieutenant-Governor	132,384	87,878
Attorney-General.....	132,369	86,028
Auditor.....	132,949	85,848
Treasurer.....	131,905	84,670
Superintendent of Public Instruction.....	130,798	85,776
Registrar of Land-Office.....	132,158	71,677

At this election, 169,173 persons were returned under the law as entitled to vote for a Constitutional Convention, but only 73,704 votes were cast in favor of calling one. The Legislature to meet in 1884 will consist of 38 Democrats and 5 Republicans in the Senate, and 89 Democrats and 11 Republicans in the House. On the 4th of September Gov. Knott took the oath of office.

General Condition.—In his message to the Legislature of 1884, Gov. Knott says:

During the two years which have elapsed since the last meeting of the General Assembly, our homes have been free from the horrors of pestilence, and our households gladdened by the blessings of plenty; our fields have been crowded with bountiful harvests, and our products have found ready and remunerative markets; capital has been profitably employed, and labor fairly rewarded; our resources have been greatly developed, and our commerce largely increased; money has been abundant, and private indebtedness among our people comparatively small; nearly 150 miles have been added to our railroads, and the products of our mines increased over 250 per cent.; while our official statistics for the last fiscal year show by far the largest production of our various agricultural staples since 1877, and in some of them an increase upon the yield of even that exceptionally prolific year.

Notwithstanding these gratifying evidences of an extraordinary popular prosperity, however, there has been but little change, and certainly no improvement, in the condition of our State finances during the period to which I have referred.

Finances.—At the close of the fiscal year ending Oct. 10, 1881, there was in the Treasury, to the credit of the revenue proper, and available for the ordinary expenditures of the State government, a balance of \$51,118.28; but, as the loan of \$300,000, which had been negotiated under the provisions of the act of 1880, in order to meet a previous deficiency, had not been paid, there was really a deficit at that time of \$248,881.72.

The fiscal year having been changed by law so as to begin on the first day of July, and the increased expenses unavoidably incident to a session of the Legislature having rendered it necessary to effect an additional loan of \$200,000, the condition of the fund available for general expenditures from Oct. 11, 1881, to

June 30, 1882, and from July 1, 1882, to June 30, 1883, was as follows:

Balance in the Treasury Oct. 10, 1881	\$51,118 28
Receipts, including bank loan of \$200,000	1,351,199 97
Total receipts and balance, as above	\$1,802,318 25
Disbursements deducted	1,354,358 28
Left a balance of	\$48,064 97
Borrowed from bank, as above	\$200,000 00
Balance in the Treasury deducted	48,064 97
Shows deficit for the year	\$151,985 08
Due banks prior to Oct. 10, 1881	800,000 00
Total deficit June 30, 1882	\$451,985 08
Balance in the Treasury June 30, 1883	\$48,064 97
Receipts	1,622,828 20
Total receipts and balance on hand	\$1,670,893 27
Disbursements deducted	1,661,768 94
Balance June 30, 1883	\$8,624 28
Due banks June 30, 1883	\$500,000 00
Less balance in Treasury	8,624 28
Actual deficit	\$491,375 67

There has been no change in the condition of the sinking fund since the last session of the General Assembly. The bonded debt of the State, as then, consists of 174 6-per-cent. military bonds, amounting to \$174,000, besides \$6,894 in old railroad scrip, and bonds of 1835 and 1841, which have been so long overdue, and unheard of for so many years, that they are supposed to have been long since lost or destroyed, and will probably never be presented for redemption. The resources of the sinking fund are also substantially as at that time. Cash in the Treasury, June 30, 1883, \$174,000.30; 406 shares of stock in the Bank of Louisville, quoted at the close of the fiscal year at \$31,262, and stock in turnpikes estimated at \$500,000, amounting in all to \$705,266.80. In regard to the financial situation the Governor says:

The difficulty has been, and is still to be found, to a great extent, in our grossly defective system of assessment, rendered still more inefficient by the negligent and unsatisfactory manner in which it is administered. The mere fact that the entire valuation of all descriptions of taxable property within the Commonwealth for the last fiscal year amounted to but little over \$374,500,000, is sufficient to satisfy any intelligent mind at all conversant with the subject that there must have been the grossest disparity between its market and the assessed value. Our real property alone is worth double that sum. Inequalities and undervaluation in assessment are, however, by no means the only evils in our revenue system. Much of our revenue is annually lost through exonerations, delinquent lists, and sales of land for taxes, though the latter evils have been lessening from year to year, and may possibly reach their minimum under a rigid enforcement of our present statutes. Besides this, large amounts of property have from time to time been exempted from taxation by private acts of the Legislature, which should be restored to the tax-list. There are also various lottery companies plying their business in our State, and claiming to exercise their privileges under the sanction of our laws, who yet pay not a dot into the Treasury. If they have a legal existence, they should be taxed; if they have not, they should be promptly suppressed.

The Penitentiary.—The condition of the convicts within the prison-walls has been greatly improved within the past three years. Those in the hands of contractors are not so well off. The total number is over 1,000, while there are cell accommodations for only 744. The Governor recommends the erection of a branch penitentiary in the western part of the State, with a capacity of 700 or 750 cells.

State Charities.—The State charitable institutions are the Eastern, Central, and Western Lunatic Asylums, the Institution for the Education and Training of Feeble-Minded Children, the Institution for the Education of the Blind, and the Institution for the Education of Deaf-Mutes.

The whole number of insane patients treated during the year was 2,143. The percentage of cures upon the admissions during the year was as follows: in the Eastern Asylum, 34.09; in the Central, 60.08; in the Western, 46.61.

The number of blind pupils during the year was 78. The average attendance of deaf-mute pupils was 140.

It appears that of the 1,049 idiots maintained last year by the Commonwealth, at a cost of \$65,471, over 54 per cent. were in four judicial circuits. "While the cause," says the Governor, "of this singular and startling difference in the development of idiocy in different localities in the same Commonwealth may be a matter of curious speculation, it may be well for practical legislators to inquire whether it has resulted, to any extent, from the importation of such unfortunate beings with the view of having them pensioned upon the bounty of the State."

Education.—The school census, white and colored, and the corresponding apportionments out of the school fund for the payment of teachers and commissioners, for the year ending June 30, 1884, were as follow:

Whole number of white-pupil children	500,694
Whole number of colored-pupil children	92,470
Total	593,294
Apportioned to white children, \$1.40 per capita	\$701,156 00
Apportioned to colored children, \$1.40 per capita	129,458 00
Total	\$830,611 00
Amount apportioned to commissioners	42,089 11
Grand total	\$872,059 71

During the session of 1881-'82 the number of matriculates in the State College was 320, and in that of 1882-'83, 316. Instruction is given under twelve professors and two assistant professors.

In March a call was issued for a conference or convention of the friends of popular education in Kentucky, to be held in Frankfort on the 5th of April, "for the purpose of considering the situation and organizing a quicker movement against illiteracy. With a quarter of a million of people in the Commonwealth who can not even read, with the average pay of teachers only \$22 per month, with the aver-

age value of 60 per cent. of our school-houses \$78, and with not less than 180,000 children who do not attend any school, it is time for us to awaken to the magnitude of the question and to make an effort for a change. Let all whose hearts are warmed with a love of the little ones come to the conference and assist in creating a public sentiment that will secure what we want."

The convention met at the appointed time and remained in session two days. It was numerously attended by representative men, irrespective of race, of party, and of vocation, from many parts of the State. Resolutions were adopted and an address to the people of the State was issued. Federal aid was approved of, and it was recommended that State taxation be supplemented by local taxation.

A twofold obstacle was recognized. "That difficulty appears first in the lack of adequate means to maintain or to employ competent

Railroads.—The Railroad*Commissioners report that on the first day of December, 1888, there were in operation in the State 1,936.99 miles of railway, which, however, do not penetrate one third of the counties in the Commonwealth. Several roads are in process of construction, while others have been projected for the near future. The Henderson bridge is in course of construction, but will not be completed before the spring of 1885. It appears

SOUTHERN EXPOSITION BUILDING, LOUISVILLE, KY.

teachers, and to construct suitable houses in which to gather and teach the children; and second, though not least, the lethargy of the people, as evinced by the fact that in 1881 there were 265,891 white children of pupil age in the State whose parents and guardians would not, or did not, send them to the common schools; and, furthermore, that 84 counties of the State reported, through their commissioners, as being stubbornly opposed to local taxation for educational purposes."

A committee was appointed to report needed amendments to the common-school law to an adjourned meeting to be held in Louisville. The report was made on the 20th of September. It recommended amendments designed to reduce the school age from six to twenty years to six to sixteen years, to lengthen the school term, increase the wages of teachers, and raise the per capita by local taxation and other means from \$1.40 to \$3. The following figures from the United States census of 1880, widely published in the State, have been a potent element in arousing public attention to the necessity of improving the educational facilities of the Commonwealth:

from the report that the business of the various railroads in the State is increasing, and their general condition improving. Steel rails are being substituted for iron, and many facilities for travel and traffic furnished which have not existed heretofore. The Chesapeake and Ohio and Southwestern has reduced its local passenger fares to three cents a mile, making that the uniform rate with all the principal lines throughout the State. The commissioners assessed the railroad property at \$35,000,000.

Geological Survey.—On this subject the Governor says:

No expenditure of money has ever been made by our State government which has been more prolific of good results than that which has been devoted to our Geological Survey. Previous to its inauguration comparatively little was known of our varied and almost illimitable resources, and consequently the vast tide of capital as well as intelligent labor, seeking new fields of employment, had drifted past us, and thousands of the most enterprising of our own people had been lured to other States supposed to have been more liberally endowed by nature with the various elements of material prosperity. But, although prosecuted under great disadvantages, it has demonstrated that our resources of every description are enormous; that our soils are adapted to the profitable growth of the widest

range of agricultural products known to the temperate zone; that one half of our primitive forests abounding in the greatest variety of valuable timbers is still untouched; that our State abounds in the richest iron-ores to be found in the world; and that our coal area is more extensive than that of the great State of Pennsylvania, or of Great Britain and Ireland combined, underlying nearly 13,000 square miles.

The Southern Exposition.—The Southern Exposition opened at Louisville, Aug. 1st, and continued one hundred days. The subscribers to the capital stock numbered 1,722, and the total amount of subscriptions was \$258,122. A building covering thirteen acres and costing \$300,000 was erected. The number of exhibits was 1,500, classified in groups and departments, arranged with reference to similarity of character. Premiums in money to the amount of \$6,750 were distributed for displays of cotton. In the general awards, 109 diplomas, 221 certificates, and 478 medals were adjudged to successful exhibitors. The total number of admissions was 770,048. The best attendance was from Sept. 10th to Oct. 20th, at which time several other expositions in different parts of the country were in operation. Although the Southern Exposition was not wholly satisfactory in a financial way, the stockholders felt warranted in increasing their capital to \$500,000, with the intention of holding another exhibition in 1884.

Miscellaneous.—A National Convention of Colored Men met in Louisville Sept. 24th, and discussed and acted upon civil and political rights, education, and labor.

KEROSENE, IMPROVED TEST FOR DANGEROUS.

The dangerous properties of kerosene are derived from the presence in the oil of the extremely volatile constituents, benzine and naphtha. These substances are easily ignited, and alone, or mixed in small proportion with kerosene, readily emit vapors which are highly inflammable, and which form with air an explosive mixture. Kerosene is safe only when it will not yield these dangerous vapors at any temperature which it is liable to assume. This temperature depends partly upon the warmth of the place where the oil is kept or used, and partly upon the heat of the burning wick warming the oil in the reservoir of the lamp. It has been found by experiment that the maximum increase of temperature of the oil in a burning lamp is about 16° Fahr. It is possible for oil to have in summer a temperature of from 90° to 100° in the unlighted lamp, and in winter a still higher temperature, if the lamp is near a stove or an open fire. Hence the lowest temperature at which an oil may evolve inflammable vapors and be considered safe must

be put at 116°, or, better still, at 120° Fahr. In testing oils a distinction is made between the *flashing-point* and the *burning-point*. The *flashing-point* is the temperature at which, when the oil is slowly heated, the vapors escaping from it will first take fire with a slight explosion when a lighted match is passed just over the surface of the liquid. It marks the temperature at which the oil becomes dangerous. The heating may be continued till a point is reached at which the oil will take fire and continue burning by itself. This is known as the *burning-point*. The *flashing-point* is easily altered by trifling variations in the conditions, as in the quantity of oil used, the rate of heating, the range of temperature through which the oil is heated, and the distance above the surface at which the match passes. The *burning-point*, upon which the ordinary fire-test is based, is of little value; for not only does it always lie above the *flashing-point*, but it bears no simple relation to the latter, and the determination of it gives really no clew to the temperature at which the oil becomes unsafe. Some twenty-five different instruments have been proposed for ascertaining the lowest *flashing-point* of a sample of oil, all of which are based upon the principle of slowly heating the oil till its vapor will take fire on passing a match or other igniting agent over it. Engler and Haas have laid down seven principles to which all such testing apparatus and experiments with them, to be of any value, must conform, viz. : 1. The quantity of oil must be the same in all experiments. In the Saybolt tester, which has been adopted by the New York Produce Ex-

FIG. 1.—SAYBOLT TESTER.

change (Fig. 1), variations of one twenty-fifth of one inch cause differences of some degrees in the *flashing-point*; 2, the oil must be heated

slowly and uniformly; 8, the temperature of the oil at the beginning of the test must be at least 18° Fahr. below its flashing-point as approximately determined; 4, the size and intensity of the flame or spark used to produce the flash must be the same in all tests; 5, the distance of the flash-flame or spark from the surface of the oil must be the same; 6, the time during which the flame or spark acts must be reduced to a minimum; 7, on account of the practical purpose for which the tests are made, the conditions under which the vapor is formed in the tester should correspond as closely as possible to those which determine its formation and explosion in lamps, etc. It can not be affirmed that all the conditions under which explosions in lamps are liable to occur are provided for in any single testing instrument of this class. The oil-reservoirs in our lamps differ much in size and shape, and hence have different capacities. The quantity of oil, its surface, and the amount of air in the reservoir with which the vapor mingles, are constantly changing while the lamp is in use and the danger is greatest. Moreover, it is not only in quietly-burning lamps that accidents occur. Probably half the accidents are due to upsetting or breaking, and the oil, which would have been safe otherwise, gives rise to explosion or flames under these more dangerous circumstances. It is important to employ, if possible, a test which shall indicate the lowest temperature at which, under any conditions, inflammable vapors can be evolved, rather than be satisfied with trusting to a method which merely proves an oil safe under certain arbitrary conditions. Certain testers have been proposed, based upon the principle of ascertaining the elastic force or tension of the vapor of the oil at a given temperature: they are deceptive and worthless, for it has been conclusively shown that no definite relation exists between the vapor-tension and the flashing-point of a kerosene. Another method of testing, by distillation, is exact, and has the additional advantage of defining the quality of the oil as an illuminating material. The oil is separated by the distillation into three fractions: a light oil distilling below 150° C.; illuminating oil, coming over between 150° and 270° C.; and a heavy oil which boils above 270° C. The first fractional distillate represents the dangerous constituents, and should not exceed 5 per cent. of the whole. The heavy oil affects the freedom with which kerosene burns, and should not form more than 15 per cent. of the whole.

Victor Meyer has introduced an exact method of determining the minimum flashing-point of kerosene by saturating the air with oil-vapor at the test-temperature. His apparatus consists of a glass cylinder which is partly filled with oil, is stoppered with a cork through which a thermometer passes, and is heated by plunging into warm water. When the temperature is reached at which the test is to be made the cylinder is briskly shaken, the stop-

per is removed, and a small flame is introduced. Flashing-points obtained by this plan are considerably lower than those given by the former methods, and are largely independent of the conditions that are considered essential to the accuracy of the determinations by them. Haas's method is the same in principle as Meyer's, but employs an electric spark instead of a flame, and the apparatus is difficult of construction and costly. Both methods require repeated shaking of the oil as the heat rises from degree to degree, which is very inconvenient. Liebermann has made a simple, successful, and practical application of the same principle in his tester, in which, Fig. 2, the

FIG. 2.—LIEBERMANN'S TESTER.

saturation of air is accomplished by forcing an air-current through the oil as it is warmed from degree to degree; and the test is made by bringing a small flame to the mouth of the oil-holder at the same instant. A tester of still more simple construction than this has been proposed. It consists, as shown in Fig. 3, of a glass cylinder closed at one end by a

FIG. 3.—IMPROVED TESTER.

cork, through which a small, bent tube, *dcb*, passes. Just within the cork the end of this tube contracts to a small orifice. The other end of the tube connects with a small bellows, or other source of slightly compressed air, the flow of which can be regulated by the pinch-

cock *a*. The best results by this method are obtained when the diameter of the cylinder is between $2\frac{1}{2}$ and 4 centimetres. The length is of no consequence, provided the cylinder is always filled with oil to within the same distance of the top; but different results are given when the distance of the oil, or rather of the foam into which its surface is broken by the air-current, is allowed to vary. Prof. John T. Stoddard, of Smith College, makes in "The Popular Science Monthly" the following statements and directions concerning the use of this method: 1. The oil-cylinder should have a diameter of from $2\frac{1}{2}$ to 4 centimetres. It may be of any convenient length, provided it holds, when filled for the tests, not less than 60 c. c. of oil. With a diameter of $2\frac{1}{2}$ centimetres, the length should be at least 16 centimetres; with a diameter of 3 centimetres, the least length should be 13 centimetres. A good tester may be made from the chimney of a student-lamp by cutting off the lower part a little above the contraction; or the whole chimney may be made to serve as an oil-cylinder by corking the large end. 2. The cylinder is filled with oil to a point where, when the air-current is running, the top of the foam is 4 or 6 centimetres below the mouth. 3. The oil is heated by means of a water-bath, into which the cylinder is plunged to the end of the oil. The temperature of the oil should not rise faster than two degrees a minute. 4. Air is forced through the oil with such velocity that about (and not less than) one centimetre of foam is maintained on the surface, and a flash-jet is brought to the mouth of the cylinder at every half degree, or oftener, in the vicinity of the flashing-point. The approach of the flashing-point is announced by the appearance of a faint blue halo of burning vapor around the flash-jet; this finally detaches itself and runs down to the surface of the oil. The reading of the temperature at this instant gives a trial flashing-point, which may be a little too high if the current of air has been running too long, or not long enough. The test should now be repeated with a fresh sample of oil, the air-current being started in full strength, not less

than one nor more than three or four minutes before the flash occurs. It is well, however, to let a very slow current of air bubble through the oil from the time that the tester is put in the water-bath, so as to secure regularity in the heating of the oil. This method has the advantages of simplicity in apparatus and manipulation, and of securing a trustworthy determination of the *lowest* flashing-point, independently of arbitrary conditions. We have seen that 116° Fahr. is the very lowest flashing-point consistent with safety. The statements so often put forth, that our best kerosenes are " 150° or 160° test" oils, are misleading; for it has reference, not to the flashing-point, but to the fire-test, or burning-point, which, as has been shown, gives little indication of the character of the oil. The best oils sold flash at about 109° Fahr., while the cheaper grades have much lower flashing-points—at least as low as 85° Fahr.

KNIT CLOTHS. The idea of knitting other fabrics than hosiery is not new, but the application of the process to the production of certain kinds of cloth has been, by improved machinery, brought apparently to perfection very recently.

Fig. 1 (see page 467) gives a good idea of a machine imported from England in 1883, and set up in Philadelphia by John E. Hanifen & Co. Portions of it were patented in England by Joseph Belshaw, as long ago as 1857; and virtually the same thing was produced by two other English inventors, and by them assigned

FIG. 2.

to John Kent, who patented it in the United States in 1872, but his patent has been contested.

Fig. 2 shows (enlarged) a section of the

FIG. 3.

FIG. 1.

needles, which are really hooks with a spring barb. These, about 1,000 in number, are fastened around the edge of the circular horizontal bed, and revolve with it.

At two, three, or four points, just outside of the circumference of the horizontal bed, are fixed groups of wheels, like those shown (enlarged) in Fig. 8 (see page 466). The various threads used pass from the bobbins upward over hooks and then downward to and under these knitting-wheels. When the bed revolves, the needles act as cogs, and turn the knitting-wheels. These wheels consist of wings or flanges, so shaped as alternately to lift and depress the threads on and between the needles, thus forming the stitches. The fabric is knit

in the form of a large tube, and is constantly drawn up and wound upon the reel overhead, which also revolves horizontally with the bed. In the engraving a portion of the fabric is represented as cut away, to show the stretcher inside. The fabric is knit with a seam running its entire length, and with a knife the operator cuts it open along this seam, thus reducing it to a flat piece of cloth, of "double width."

The most obvious advantage in the use of this machine, over a loom, is in the matter of speed. It has a smooth, continuous, rotary motion, instead of the constantly interrupted alternating motion of a shuttle, and will produce about double the amount of cloth in a

given time. It is claimed also that the fabric is superior in smoothness of face and evenness of texture. Almost any kind of "backing" can be put on (all in one motion of the ma-

chine), from a smooth, hard one, to that of the heaviest, shaggy overcoating. Its productions include stockinet, ladies' cloakings, overcoatings, cheviots, astrakhans, and suitings.

L

LANSDOWNE, Henry Charles Keith Petty Fitzmaurice, Marquis of, Governor-General of Canada, born in England, Jan. 14, 1845. He received his education at Eton, and at Balliol College, Oxford, and became a captain in the Yeoman cavalry of Wiltshire. His father, the fourth marquis, died July 5, 1866, and he succeeded to the titles and estates. His minor titles are: in the peerage of Great Britain—Earl of Wycombe, of Chipping Wycombe, county Bucks; Viscount Caln and Calnstone, county Wilts; and Lord Wycombe, Baron of Chipping Wycombe, county Bucks; in the peerage of Ireland—Earl of Kerry and Earl of Shelburne; Viscount Clanmaurice and Fitz-

General of Canada. He married, in November, 1869, the youngest daughter of the Duke of Abercorn, and has two sons and two daughters.

LASKER, Eduard, a German statesman, born in Jaroczin, Posen, Oct. 14, 1829; died in New York, Jan. 5, 1884. He was the son of a Jewish merchant, was admitted to the bar in Berlin, and passed three years in travel. On returning, he took a place in the Berlin City Court in 1856, and in 1858 became associate justice. He resigned this post in 1870, to practice as an attorney. Later he accepted the post of syndic in the mortgage registry office of Berlin. He was elected deputy in the Prussian Chamber in March, 1865, and re-elected in July, 1866. In 1866 he left the Progressive party and became, in association with Karl Twesten, the founder of the National-Liberal party. From 1868 to 1878 he represented Magdeburg in the House of Deputies. From 1875 to 1879 he was member for Frankfurt-on-the-Main. From 1866 till his death he was a member of the Reichstag.

During the nineteen years of Lasker's parliamentary activity there was no important legislative work in which he did not take part, and which does not bear the impress of his knowledge and acumen. His activity centered in the Reichstag. The unification of the German Empire on a representative basis was the aim of his life. In the civil consolidation of the empire he bore as conspicuous a part as Count Bismarck in the sphere of dynastic and international politics. The great National-Liberal party, of which he was the chief founder and parliamentary leader, united the liberal thought and hopes of the country in favor of the policy of Bismarck, until the time when by its support the latter had overcome the particularist elements and was able after the French war to repudiate the constitutional doctrines which he had temporarily professed. A great part of Lasker's work was inconspicuous. He was regularly placed on the committees, in the Reichstag and the Prussian Landtag, which were appointed for the elaboration of legislative projects, and was almost invariably intrusted with the preparation of the report. In taking so prominent a part in the practical work of legislation, however, he became the most frequent speaker and proponent of motions in the legislative halls, and thus was a familiar figure before the public. Next to the ideal of German unity, the cause of legality and the abolition of arbitrary police powers was nearest to his heart. In this sense the Prussian local administrative regulations

MARQUIS OF LANSDOWNE.

maurice; Baron of Kerry, Lixnaw, and Dunkerron. His mother is Baroness Nairne in her own right; holding the title once held by the Scottish poetess who wrote "The Land o' the Leal," though she is not her descendant.

The Marquis was one of the Lords of the Treasury from 1868 to 1872, and then became Under-Secretary for War, which office he held two years. He was appointed Under-Secretary for India when Mr. Gladstone became Premier in 1880, but retired at the end of two months, because he disagreed with the Government's Irish policy. In October, 1883, he succeeded the Marquis of Lorne as Governor-

were amended through his efforts. The same idea underlay the German industrial laws of 1869, one of the greatest works of his life. In 1870 he introduced in the Reichstag the proposition to incorporate Baden in the North German League. In 1871 and the following years he advocated the proposition to extend clause 18 of the fourth article of the German Constitution to the civil law, i. e., to unify the laws of the German states into a single imperial system. In this most important part of the process of transforming the league into a nation, the chief share of the labor fell to him, and it remains a monument of his historical services and juristic genius. The imperial judiciary, which was introduced in October, 1879, the common code of procedure, and the codification of the civil laws, were the laborious fruits of this period of his life.

Lasker's greatest popular success was his speech in the Prussian Diet on Feb. 7, 1873, in which he laid bare the jobbery of promoters and the corruption of officials in connection with railroad concessions and the establishment of fraudulent joint-stock companies. His proposal of an investigating commission was approved; and, although the results of the investigation were not equal to the expectations, the law officers of the Government kept a closer watch, the commercial schemers and their aristocratic accomplices took alarm, and no such scandals have occurred again.

Lasker's literary labors were confined to contributions in Oppenheim's "German Year-Book" on Prussian constitutional history (1875). He wrote the report of the National-Liberal party for the legislative period of the Reichstag, Customs Union, and Prussian Diet ending in 1870, which was printed in Hirth's "Annals" (1870). His most noted oratorical efforts outside the legislature were a commemoration address on Karl Twisten.

In support of Prince Bismarck's policy, Lasker advocated fixing the military budget for seven years in advance. He also co-operated in bringing about the Prussian administrative law. Yet as soon as the aims of the Chancellor ran counter to his political principles, he opposed the Government with such energy that it often came to parliamentary duels between the two. Their differences were repeatedly composed, until Bismarck's economical and tax-reform projects separated them completely. Lasker upheld the free-trade principle, and withdrew from the National-Liberal party. In the sitting of May 2, 1879, he declared that by the economical policy of the Government he was driven into the opposition. He was followed in August, 1879, by Forkenbeck, Staufenberg, and Bamberger, and the Secessionist fraction became the most vigorous antagonists of the Chancellor.

Dr. Lasker's health was broken for two or three years before his death, and he visited Switzerland several times, with the object of recuperating his strength. From the same

motive he came to America late in the summer of 1883, and made a tour of the United States. After visiting his brother in Texas, he returned to New York. On the evening of his death he dined with Mr. Seligman, the banker, and was taken with heart-disease while walking back to his boarding-place, dying in a stable, into which he was taken, directly after the arrival of a physician.

LAW, CONSTITUTIONAL. International Arbitration.—An important opinion on this subject was rendered by the United States Supreme Court on Jan. 7, 1884, in the noted Weil and La Abra cases. In 1868 a convention between the United States and Mexico was concluded for the arbitration and payment of claims of citizens of either country against the Government of the other. These claims were to be submitted to a mixed commission, which was to take testimony and hear counsel. The treaty stipulated that "the President of the United States and the President of the Mexican Republic hereby solemnly and sincerely engage to consider the decision of the commissioners conjointly, or of the umpire, as the case may be, as absolutely final and conclusive upon each claim decided upon by them or him respectively, and to give full effect to such decision without any objection, evasion, or delay whatever." It was then provided that the aggregate of all the amounts awarded to citizens of one country should be deducted from the aggregate awarded to citizens of the other, and that \$300,000 of the balance should be paid by the debtor to the creditor Government within twelve months from the close of the commission, and that the rest should be paid in yearly installments, not exceeding \$300,000 each. It was further stipulated:

The high contracting parties agree to consider the result of the proceedings of this commission as a full, perfect, and final settlement of every claim upon either Government arising out of any transaction of a date prior to the exchange of the ratifications of the present convention; and further engage that every such claim, whether or not the same may have been presented to the notice of, made, preferred, or laid before the said commission, shall, from and after the conclusion of the proceedings of the said commission, be considered and treated as finally settled, barred, and thenceforth inadmissible.

When the work of the commission ended, it was found that the balance against Mexico was about \$1,200,000, and annual payments were duly made by that Government in accordance with the terms of the convention. Among the claims presented to the commission by citizens of the United States was one of Benjamin Weil for cotton alleged to have been seized in Mexico and confiscated by the Mexican authorities in 1864, and one by the La Abra Silver Mining Company for the loss of a mine in the State of Durango, which the owners alleged they were forced to abandon in consequence of illegal acts on the part of Mexican officers. On Oct. 1, 1875, an award of \$469,610 was made in favor of Weil against Mexico, and on December

27th following one of \$688,041 was made in favor of the La Abra Company.

In June, 1878, Congress passed an act providing that as often as installments should be received from Mexico, the amount should be distributed pro rata among the claimants to whom awards had been made. Meanwhile Mexico had made representations to the Government at Washington that the Weil and La Abra claims were fraudulent, and that the awards had been obtained through perjured testimony, and asked that a rehearing be had in these cases. In view of this representation, Congress, in the act of June, 1878, requested the President to investigate these charges of fraud, and provided that if he should find "the honor of the United States, the principles of public law, or considerations of justice and equity" required that the awards should be opened, and the cases re-tried, it should be lawful for him to withhold payment until the cases should be re-tried in such manner as the United States and Mexico might agree.

During the year 1879 President Hayes caused an investigation to be made, and the conclusions reached were thus given in the report of Mr. Evarts, then Secretary of State:

1. I conclude, therefore, that neither the principles of public law nor considerations of justice or equity require or permit, as between the United States and Mexico, that the awards in these cases should be opened and the cases retried before a new international tribunal or under any new convention or negotiation respecting the same between the United States and Mexico.

2. I am, however, of opinion that the matters brought to the attention of this Government on the part of Mexico do bring into grave doubt the substantial integrity of the claim of Benjamin Weil and the sincerity of the evidence as to the measure of damages insisted upon and accorded in the case of the La Abra Silver Mining Company, and that the honor of the United States does require that these two cases should be further investigated by the United States to ascertain whether this Government has been made the means of enforcing against a friendly power claims of our citizens based upon or exaggerated by fraud. If such investigation should remove the doubts which have been fairly raised upon the representations of Mexico, the honor of the United States will have been completely maintained. If, on the other hand, the claimants shall fail in removing these doubts, or they should be replaced by certain condemnation, the honor of the United States will be vindicated by such measures as may then be dictated.

3. The executive government is not furnished with the means of instituting and pursuing methods of investigation which can coerce the production of evidence or compel the examination of parties and witnesses. The authority for such an investigation must proceed from Congress. I would advise, therefore, that the proofs and the conclusions you shall come to thereon, if adverse to the immediate payment on these awards of the installments received from Mexico, be laid before Congress for the exercise of their plenary authority in the matter.

A copy of this report was sent to Congress by the President April 15, 1880. It concluded as follows: "Unless Congress should now make this disposition of the matter, and furnish thereby definite instructions to the department to reserve further payments upon these

awards till the conclusion of such investigation, and to take such further order with the same thereafter as Congress might direct, it would appear to be the duty of the Executive to accept these awards as no longer open to reconsideration, and proceed in the payment of the same, pro rata with all other awards under the convention." No decisive action was then taken by Congress, and, after the close of the session, payments were made on these awards, by direction of President Hayes, the same as on the others. When President Garfield came into office, four installments had been paid to the Weil and La Abra claimants, and a fifth was ordered by him to be paid. After Mr. Arthur became President, he ordered the matter to be again investigated, and "believing that said award was obtained by fraud and perjury," he directed further payments to be withheld, and negotiated a treaty with Mexico for a re-trial of the cases. This treaty is still (March 15, 1884) pending in the Senate. Suits were thereupon brought by the claimants to compel Secretary Frelinghuysen to pay to them their share of the sixth installment paid to the United States by Mexico on Jan. 31, 1882. They contended:

1. That the awards under the convention vested in the several claimants an absolute right to the amounts awarded them respectively, and that this right was property which neither the United States alone, nor the United States and Mexico together, could take away; and,

2. That, if this were not so, the action of President Hayes, under the fifth section of the act of 1878, was conclusive on President Arthur, and deprived him of any right he might otherwise have had to investigate the charges of fraud presented by the Mexican Government, or to withhold from the relators their distributive shares of any moneys thereafter paid to the Secretary of State under the authority of the first section.

The issue thus raised was, first, as to the power of two governments to reopen an arbitration of claims of citizens under a compact providing that the decision of the commission should be "absolutely final and conclusive," and "without appeal"; that the Presidents of the two republics should "give full effect to such decisions without any objection, evasion, or delay whatsoever," and that the final action of the commission should be considered "a full, perfect, and final settlement of every claim" passed upon; and, second, as to the power of the President under such compact to withhold payment of awards pending the negotiations for a treaty providing for a re-trial of the claims. The contention relates to unpaid installments. The Supreme Court held that the two governments were free to make a new agreement, and that the President of the United States had the right to withhold payment of awards alleged to have been fraudulently obtained.

Referring to the strong language of the convention, that the decision of the commission should be "absolutely final and conclusive," etc., the Court said that this is to be construed

as language used in a compact of two nations "for the adjustment of the claims of the citizens of either against the other," and entered into to "increase the friendly feeling existing between the republics."

No nation treats with a citizen of another nation except through his government. The treaty, when made, represents a compact between the governments, and each government holds the other responsible for everything done by their respective citizens under it. The citizens of the United States having claims against Mexico were not parties to this convention. They induced the United States to assume the responsibility of seeking redress for injuries they claimed to have sustained by the conduct of Mexico, and as a means of obtaining such redress the convention was entered into, by which not only claims of citizens of the United States against Mexico were to be adjusted and paid, but those of citizens of Mexico against the United States as well. By the terms of the compact the individual claimants could not themselves submit their claims and proofs to the commission to be passed upon. Only such claims as were presented to the Governments respectively could be "referred" to the commission, and the commissioners were not allowed to investigate or decide on any evidence or information except such as was furnished by or on behalf of the Governments. While the claims of the individual citizens were to be considered by the commission in determining amounts, the whole purpose of the convention was to ascertain how much was due from one Government to the other on account of the demands of their respective citizens. As between the United States and Mexico the awards are final and conclusive until set aside by agreement between the two Governments or otherwise. Mexico can not, under the terms of the treaty, refuse to make the payments at the times agreed on if required by the United States. This she does not now seek to do. Her payments have all been made promptly as they fall due, as far as these records show. What she asks is the consent of the United States to her release from liability under the convention on account of the particular awards now in dispute, because of the alleged fraudulent character of the proof in support of the claims which the United States were induced by the claimants to furnish for the consideration of the commission.

Chief-Justice Waite, who wrote the opinion, proceeded as follows:

As to the right of the United States to treat with Mexico for a retrial, we entertain no doubt. Each Government, when it entered into the compact under which the awards were made, relied on the honor and good faith of the other for protection as far as possible against frauds and impositions by the individual claimants. It was for this reason that all claims were excluded from the consideration of the commission except such as should be referred by the several governments, and no evidence in support of or against a claim was to be submitted except through or by the Governments. The presentation by a citizen of a fraudulent claim or false testimony for reference to the commission was an imposition on his own Government, and if that Government afterward discovered that it had in this way been made an instrument of wrong toward a friendly power, it would be not only its right, but its duty, to repudiate the act and make reparation as far as possible for the consequences of its neglect if any there had been. International arbitration must always proceed on the highest principles of national honor and integrity. No technical rules of pleading as applied in municipal courts ought ever to be allowed to stand in the way of the national power to do what is right under all the circumstances. The cases cited by counsel all relate to the disposition to be made of the proceeds of international awards after they have passed beyond the reach of the Govern-

ments and into the hands of private parties. The language of the opinions must be construed in connection with this fact.

The first section of the act of 1873, said the Chief-Justice, authorizes and requires the Secretary of State to receive the moneys paid by Mexico under the convention, and to distribute them among the several claimants, but it manifests no disposition on the part of Congress to encroach on the power of the President and Senate to conclude another treaty with Mexico, with respect to any or even all the claims allowed by the commission, if in their opinion the honor of the United States demand it. At most, it only provides for receiving and distributing the sums paid without a protest or reservation, such as, in the opinion of the President, is entitled to further consideration. It does not undertake to set any new limits on the powers of the Executive. By the fifth section of that act the President is expressly authorized to refuse payment, and to negotiate a new treaty if he deemed it expedient. It is clearly within his discretion to withhold all further payments until the diplomatic negotiations between the two governments are concluded. "The United States, when they assumed the responsibility of presenting the claims of their citizens to Mexico for payment, entered into no contract obligations with the claimants to assume their frauds and to collect on their account all that, by their imposition of false testimony, might be given in the awards of the commission. As between the United States and the claimants, the honesty of the claims is always open to inquiry for the purposes of fair dealing with the government against which, through the United States, a claim has been made."

Legal-Tender Acts.—On March 3, 1884, the United States Supreme Court rendered an opinion sustaining the validity of the legal-tender acts passed by Congress both during and since the war. It holds that Congress has the constitutional power to make United States notes a legal tender in payment of private debts, either in time of war or in time of peace.

This is the third time that the court has decided this question within fourteen years. It was first called upon to consider the constitutionality of the legal-tender legislation of Congress in the case of Hepburn against Griswold, decided during the session of 1869-'70, and reported in vol. viii of Wallace's Reports. The court then decided that the acts of 1862 and 1863, making United States notes a legal tender in payment of all debts public and private, were unconstitutional so far as they applied to debts contracted before the passage of those acts. The question as to pre-existing debts was the only one raised by the case, and the only one expressly decided. The reasoning of the court, however, went to the extent that Congress had no constitutional power to make United States notes a legal tender, either for

past or future debts. The court affirmed the following principles:

There is in the Constitution no express grant of legislative power to make any description of credit currency a legal tender in payment of debts.

The words "all laws necessary and proper for carrying into execution" powers expressly granted or vested have, in the Constitution, a sense equivalent to that of the word laws, not absolutely necessary, indeed, but appropriate, plainly adapted to constitutional and legitimate ends, which are not prohibited, but consistent with the letter and spirit of the Constitution; laws really calculated to effect objects intrusted to the Government.

Among means appropriate, plainly adapted, not inconsistent with the spirit of the Constitution, nor prohibited by its terms, the Legislature has unrestricted choice; but no power can be derived by implication from any express power to enact laws as means for carrying it into execution, unless such laws come into this description.

The making of notes or bills of credit a legal tender in payment of pre-existing debts is not a means appropriate, plainly adapted, or really calculated to carry into effect any express power vested in Congress, is inconsistent with the spirit of the Constitution, and is prohibited by the Constitution.

This case was decided in conference, Nov. 27, 1869. The court then consisted of eight justices. The decision was concurred in by five justices—Chase, Nelson, Grier, Clifford, and Field. Three dissented—Swayne, Miller, and Davis. The opinion, which was written by Chief-Justice Chase, was announced from the bench, Feb. 8, 1870. Justice Grier resigned his seat Feb. 1, 1870, and on the 18th of that month Justice Strong was appointed his successor. On April 10, 1869, Congress had passed an act, to take effect in December following, increasing the number of justices from eight to nine. Justice Bradley was appointed as the additional member on March 21, 1870.

Before the court as thus constituted the question of the power of Congress to issue legal-tender notes was again brought in the suits of Knox against Lee, and Parker against Davis, reported in vol. xii of Wallace's Reports, under the title of "Legal-Tender Cases." The cases were decided May 1, 1871, and the opinion delivered Jan. 15, 1872. The court reversed its decision in Hepburn against Griswold, and held that Congress had constitutional power to make United States notes a legal tender for debts contracted both before and after the passing of the acts.

The opinion of the court was written by Justice Strong, and concurred in by Justices Swayne, Miller, Davis, and Bradley. The minority in Hepburn against Griswold, re-enforced by the two new justices, Strong and Bradley, became the majority in the second case. Chief-Justice Chase and Justices Nelson, Clifford, and Field, who with Justice Grier had formed the majority in the first case, became the minority in the second.

The acts whose constitutionality the court was then called upon to consider were passed during the war. The opinion of the majority laid great stress upon this fact, and the fact that there was then a public exigency that

does not exist in time of peace. It pointed out that the legal-tender legislation was, in the opinion of Congress and the executive department of the Government, a necessary war measure and essential to the preservation of the nation. Under these circumstances the majority had no doubt that Congress had under the Constitution an implied war power to issue the legal-tender notes. But the Court seemed to imply that in other times and other circumstances a different principle might govern. It said: "This brings us to the inquiry whether they [these acts] were, when enacted, appropriate instrumentalities for carrying into effect or executing any of the known powers of Congress, or of any department of the Government. Plainly, to this inquiry, a consideration of the time when they were enacted, and of the circumstances in which the Government stood, is important. It is not to be denied that acts may be adapted to the exercise of lawful power, and appropriate to it, in seasons of exigency, which would be inappropriate at other times."

This decision did not have the usual effect of a judgment of a court of last resort—that is, of putting at rest the legal question involved. By many public men it was regarded as recognizing in Congress a vast power for mischief, and by not a few constitutional lawyers it was looked upon as an unsound interpretation of the Constitution. The fact that the Court had within a little more than a year reversed its own decision in so important a matter, that the reversal had been brought about by the concurrence of the two new members, that the judgment rested on a bare majority of one, and was vigorously opposed by four of the nine justices—these and other considerations it was asserted naturally had the effect of causing no little popular dissatisfaction with the judgment, and lessening its weight as an authority. Moreover, it was argued that what the Court had decided in the second case, was the question as to the power of Congress to issue legal-tender notes in time of war, and as a war necessity. But as the war began to recede into the past, the question loomed up whether Congress had the same power in time of peace, and this question assumed practical importance when Congress exercised the power by passing the act of 1878 providing for a re-issue of legal-tender notes.

These considerations led to a movement to bring the issue before the Supreme Court for a third time, in the hope of securing a reversal of the principle affirmed in the legal-tender cases in 1871, and with the view of at least finally settling the law one way or the other. A proposition to prepare a test case was made to Gen. Benjamin F. Butler, early in 1879, by Hon. S. B. Chittenden, a Republican member of Congress from the State of New York. The proposition was accepted, and a suit was accordingly brought in the United States Circuit Court for the Southern District of New York in the name of Augustus D. Juilliard, a citizen of

New York, against Thomas S. Greenman, a citizen of Connecticut. The complaint alleged that the plaintiff had sold the defendant 100 bales of cotton for the agreed price of \$5,122.90; that the defendant had offered in payment \$22.90 in gold and silver coin, and \$5,100 in United States legal-tender notes which had been issued during the war and re-issued under an act of Congress of May 31, 1878; and that the plaintiff had refused to accept these notes as valid legal tender. The case was carried to the United States Supreme Court, which gave its decision March 3, 1884, sustaining the constitutionality of the act of 1878, as well as of the legal-tender acts previously passed, and holding that Congress has the constitutional power to make the treasury notes of the United States a legal tender in payment of private debts in time of peace as well as in time of war. The opinion was prepared by Justice Gray, and concurred in by seven of his associates. Justice Field alone dissented, and gave an elaborate opinion in support of his views.

The opinion of the Court is substantially given in what follows: A constitution, establishing a frame of government, declaring fundamental principles, and creating a national sovereignty, and intended to endure for ages and to be adapted to the various crises of human affairs, is not to be interpreted with the strictness of a private contract. The Constitution of the United States, by apt words of designation or general description, marks the outlines of the powers granted to the national legislature, but it does not undertake, with the precision and detail of a code of laws, to enumerate the subdivisions of those powers, or to specify all the means by which they may be carried into execution. The breadth and comprehensiveness of the words of the Constitution are nowhere more strikingly exhibited than with regard to the powers over revenue, finance, and currency. That instrument declares that Congress shall have power—

To lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States; but all duties, imposts, and excises shall be uniform throughout the United States;

To borrow money on the credit of the United States;

To regulate commerce with foreign nations and among the several States and with Indian tribes;

To coin money, regulate the value thereof and of foreign coin, and fix the standard of weights and measures.

The section which contains the grant of these and other principal legislative powers concludes by declaring that Congress shall have power "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof."

By the settled construction and the only reasonable interpretation of this clause the words "necessary and proper" are not limited to such

measures as are absolutely and indispensably necessary, without which the powers granted must fail of execution; but they include all appropriate means which are conducive or adapted to the end to be accomplished, and which in the judgment of Congress will most advantageously effect it. In the case of *McCulloch vs. Maryland* (vol. iv, Wheaton's Reports), in which the power of Congress to incorporate a bank was affirmed by the Supreme Court, notwithstanding the Constitution does not enumerate, among the powers granted, that of establishing a bank, or creating a corporation, Chief-Justice Marshall said: "We admit, as all must admit, that the powers of the Government are limited, and that its limits are not to be transcended. But we think the sound construction of the Constitution must allow to the national legislature that discretion, with respect to the means by which the powers it confers are to be carried into execution, which will enable that body to perform the high duties assigned to it, in the manner most beneficial to the people. Let the end be legitimate, let it be within the scope of the Constitution, and all means which are appropriate, which are plainly adapted to that end, which are not prohibited, but consist with the letter and spirit of the Constitution, are constitutional." The rule of interpretation, says Justice Gray, thus laid down, has been constantly adhered to and acted on by this court.

The power of Congress to emit bills of credit, to incorporate national banks, to provide a currency for the whole country, is firmly established by decisions of the court. The court has also decided that the power "to borrow money on the credit of the United States" is the power to raise money for the public use on a pledge of the public credit, and may be exercised to meet either present or anticipated expenses and liabilities of the Government. It includes the power to issue, in return for the money borrowed, the obligations of the United States in any appropriate form of stocks, bonds, bills, or notes. Congress has authority to issue these obligations in a form adapted to circulation, from hand to hand, in the ordinary transactions of commerce and business. It may provide for their redemption in coin or bonds, and may make them receivable in payment of debts to the Government. The several States are prohibited from coining money, emitting bills of credit, or making anything but gold and silver coin a tender in payment of debts. But no intention can be inferred from this to deny to Congress either of these powers. Congress is neither expressly authorized nor expressly forbidden to emit bills of credit, but the Supreme Court has conceded to it the power to emit bills of credit, and of making every provision for their circulation as currency, short of giving them the quality of legal tender for private debts.

It appears to us to follow, as a logical and necessary consequence, that Congress has the power to issue the

obligations of the United States in such form, and to impress upon them such qualities as currency for the purchase of merchandise and the payment of debts, as accord with the usage of sovereign governments. The power, as incident to the power of borrowing money and issuing bills or notes of the Government for money borrowed, of impressing upon those bills or notes the quality of being a legal tender for the payment of private debts, was a power universally understood to belong to sovereignty, in Europe and America, at the time of the framing and adoption of the Constitution of the United States. The governments of Europe, acting through the monarch or the legislature, according to the distribution of powers under their respective constitutions, had and have as sovereign a power of issuing paper money as of stamping coin.

The power of issuing bills of credit, and making them, at the discretion of the legislature, a tender in payment of private debts, had long been exercised in this country by the several colonies and States; and during the Revolutionary War the States, upon the recommendation of the Congress of the Confederation, had made the bills issued by Congress a legal tender. The exercise of this power not being prohibited to Congress by the Constitution, it is included in the power expressly granted to borrow money on the credit of the United States.

This position is fortified by the fact that Congress is vested with the exclusive exercise of the analogous power of coining money and regulating the value of domestic and foreign coin, and also with the paramount power of regulating foreign and interstate commerce. Under the power to borrow money on the credit of the United States, and to issue circulating notes for the money borrowed, its power to define the quality and force of these notes as currency is as broad as the like power over a metallic currency under the power to coin money and to regulate the value thereof. Under the two powers, taken together, Congress is authorized to establish a national currency, either in coin or in paper, and to make that currency lawful money for all purposes, as regards the national Government or private individuals.

The power of making the notes of the United States a legal tender in payment of private debts, being included in the power to borrow money and to provide a national currency, is not defeated or restricted by the fact that its exercise may affect the value of private contracts. If, upon a just and fair interpretation of the whole Constitution, a particular power or authority appears to be vested in Congress, it is no constitutional objection to its existence or to its exercise that the property or the contracts of individuals may be incidentally affected. The decisions of this Court already cited afford several examples of this.

Congress, as the legislature of a sovereign nation, being expressly empowered by the Constitution "to lay and collect taxes, to pay the debts and provide for the common defense and general welfare of the United States," and "to borrow money on the credit of the United States," and "to coin money and regulate the value thereof and of foreign coin"; and being clearly authorized, as incidental to the exercise of those great powers, to emit bills of credit, to charter national banks, and to provide a national currency for the whole people, in the form of coin, treasury notes, and national-bank bills; and the power to make the notes of the Government a legal tender in payment of private debts being one of the powers belonging to sovereignty in other civilized nations, and not expressly withheld from Congress by the Constitution—we are irresistibly impelled to the conclusion that the impressing upon the treasury notes of the United States the quality of being a legal tender in payment of private debts is an appropriate means, conducive and plainly adapted to the execution of the undoubted powers of Congress, consistent with the letter and spirit of the Constitution, and, therefore, within the meaning of that instrument, "necessary and proper for carrying into execution the powers vested by

this Constitution in the Government of the United States."

Such being our conclusion in matter of law, the question whether at any particular time, in war or in peace, the exigency is such, by reason of unusual and pressing demands on the resources of the Government, or of the inadequacy of the supply of gold and silver coin to furnish the currency needed for the uses of the Government and of the people, that it is, as a matter of fact, wise and expedient to resort to this means, is a political question to be determined by Congress when the question of exigency arises, and not a judicial question to be afterward passed upon by the courts. To quote once more from the judgment in *McCulloch vs. Maryland*: "Where the law is not prohibited, and is really calculated to effect any of the objects intrusted to the Government, to undertake here to inquire into the degree of its necessity would be to pass the line which circumscribes the judicial department and to tread on legislative ground." (Vol. iv, *Wheaton's Reports*, p. 423.)

Of the eight justices who concurred in the judgment of the Court, Justice Miller took part in the two former decisions of this question, dissenting from the opinion of the majority in *Hepburn against Griswold*, which denied to Congress the power to issue legal-tender notes, and agreeing with the majority in *Legal-Tender Cases* that Congress has such power. Justice Bradley was not a member of the court when *Hepburn against Griswold* was decided; he was one of the majority in *Legal-Tender Cases*. The other six justices—Waite, Harlan, Woods, Matthews, Gray, and Blatchford—who concur in the opinion of the Court in *Juilliard against Greenman*, have come upon the bench since the second of the two former cases was decided. Justice Field has taken part in the decision of all three cases, and in the latest one delivered an elaborate dissenting opinion, adhering to the same principles maintained by him in the other two, namely, that Congress has no constitutional power to make United States notes a legal tender.

On March 10, 1884, propositions to amend the Constitution were brought forward as follows: by Senator Bayard, of Delaware, and by Representatives Hewitt and Potter, of New York, that Congress shall not have power to make anything but gold and silver coin a legal tender for the payment of debts—Mr. Potter's containing the proviso, "except after a declaration of war, when the public safety may require it"; by Senator Garland, of Arkansas, that the legal-tender notes issued by Congress shall never exceed \$350,000,000, except by a two-third vote of each branch.

Power of Congress touching Elections.—An important opinion on this subject was rendered by the United States Supreme Court on March 8, 1884. The question was raised in what are known as the "Georgia Ku-klux cases," on petitions for writs of *habeas corpus* to release a number of persons convicted in the Federal Circuit Court for the Northern District of Georgia on the charge of threatening, beating, and otherwise intimidating colored voters at an election in that State for a member of Congress. The offense set forth in the indict-

ment was created by acts of Congress passed in 1870 and 1871, and is now covered by sections 5508 and 5520 of the Revised Statutes of the United States, which are as follow :

Section 5508. If two or more persons conspire to injure, oppress, threaten, or intimidate any citizen in the free exercise or enjoyment of any right or privilege secured to him by the Constitution or laws of the United States, or because of his having so exercised the same ; or if two or more persons go in disguise on the highway, or on the premises of another, with intent to prevent or hinder his free exercise or enjoyment of any right or privilege so secured, they shall be fined not more than five thousand dollars and imprisoned not more than ten years ; and shall, moreover, be thereafter ineligible to any office, or place of honor, profit, or trust created by the Constitution or laws of the United States.

Sec. 5520. If two or more persons in any State or Territory conspire to prevent by force, intimidation, or threat, any citizen who is lawfully entitled to vote, from giving his support or advocacy, in a legal manner, toward or in favor of the election of any lawfully qualified person as an elector for President or Vice-President, or as a member of the Congress of the United States ; or to injure any citizen in person or property on account of such support or advocacy ; each of such persons shall be punished by a fine of not less than five hundred nor more than five thousand dollars, or by imprisonment, with or without hard labor, not less than six months nor more than six years, or by both such fine and imprisonment.

The question was, whether these sections are constitutional, whether Congress has the power to prescribe crimes against the elective franchise at an election in a State at which Federal officers are voted for, and to impose punishment for such crimes. The Court decides this question in the affirmative. In the opinion, Justice Miller says: "That a government whose essential character is republican, whose Executive head and legislative body are both elective, whose most numerous and powerful branch of the legislature is elected by the people directly, has no power, by appropriate laws, to secure this election from the influence of violence, of corruption, and of fraud, is a proposition so startling as to arrest attention and demand the gravest consideration. If this Government is anything more than a mere aggregation of delegated agents of other States and governments, each of which is superior to the General Government, it must have the power to protect the elections on which its existence depends from violence and corruption. If it has not this power, it is left helpless before the two great natural and historical enemies of all republics, open violence and insidious corruption."

To the argument that, because no express power is delegated to Congress to provide for preventing violence exercised on the voter as a means of controlling his vote, no such law may be enacted by Congress, he replies: "It destroys at one blow, in construing the Constitution of the United States, the doctrine, universally applied to all instruments of writing, that what is implied is as much a part of the instrument as what is expressed. This principle, in its application to the Constitution

of the United States, more than to almost any other writing, is a necessity, by reason of the inherent ability to put into words all derivative powers—a difficulty which the instrument itself recognizes by conferring on Congress the authority to pass all laws necessary and proper to carry into execution the powers especially granted, and all other powers vested in the Government, or any branch of it, by the Constitution."

The opinion cites the power of Congress to pass laws to punish theft or robbery of the treasury of the United States, and depredations on the mails, although Congress is not expressly authorized to enact such laws. The contention that the States can pass the necessary laws to preserve the purity of elections and protect voters, is met by pointing out the fact that the existence of State laws against counterfeiting coin of the United States has never been held to supersede the acts of Congress passed for that purpose, or to justify the United States in failing to enforce its own laws to protect the circulation of the coin which it issues. The Court refers also to the attempts of Congress to protect officers of the Government in the exercise of their duties in hostile communities, in the nullification difficulties in South Carolina, and in the late war during the troubles growing out of the enforcement of the draft. Justice Miller asks, if it be not doubted that Congress has the power to provide laws for the proper conduct of elections for Representatives in Congress, is such power annulled because an election for State officers is held at the same time and place? and says: "This question answers itself, and it is only because Congress, through long habit and long years of forbearance, has, in deference and respect to the States, refrained from the exercise of these powers, that they are now doubted."

The Court holds that the fifteenth amendment of the Constitution, by its limitation on the power of the States in the exercise of their right to prescribe the qualifications of voters in their election, and by its limitation of the power of the United States over that subject, clearly shows that the right of suffrage was considered to be of supreme importance to the national Government, and was not intended to be left within the exclusive control of the States. The opinion closes as follows:

In a republican government like ours, where political power is reposed exclusively in representatives of the entire body of the people chosen at short intervals by popular elections, the temptations to control these elections by violence and by corruption is a constant source of danger. Such has been the history of all republics, and though ours has been comparatively free from both these evils in the past, no lover of his country can shut his eyes to the fear of future danger from both sources. If the recurrence of such acts as these prisoners stand convicted of, are too common in one quarter of the country, and give omen of danger from lawless violence, the free use of money in elections, arising from the vast growth of recent wealth in other quarters, presents

equal cause for anxiety. The rule to show cause in this case is discharged, and the writ of *habeas corpus* denied.

(For the opinion of the Supreme Court declaring unconstitutional that part of the "Klux act" passed by Congress in 1871, and now embodied in section 5519 of the Revised Statutes, see the "Annual Cyclopædia" for 1882, page 457.)

LITERATURE, AMERICAN, IN 1883. The total number of books published in the United States for the year 1883 did not much exceed the aggregate of 1882. The work done by American publishers has been, as usual, largely reprints from English plates, or importations of sheets bound and published under an American imprint. Of what may be called distinctively American literature, that is, the products of American authors, there has not been any notable increase in number of books, though the average quality distinctly indicates a higher intellectual standard. It must be said, however, that in the severer lines of thought and study, theology and religion excepted, there has not been shown the same relative activity as in the more popular forms of literature. This is specially the case in science, metaphysics, sociology, economics, and kindred subjects. On the other hand, the showing in fiction, biography, history, travel, poetry, and general literature has been signally brilliant and satisfactory. In theology the contributions have been a distinctive feature of the publications of the year, including books which deal with theology from the agnostic stand-point.

The total number of books published during the year in the United States, classified and compared with those of 1882, will be found in the following summary taken from the "Publishers' Weekly," which is probably as approximately close as is possible to be obtained. This list includes reprints of foreign books as well as books by American authors:

	1882.	1883.
Fiction	767	670
Law	261	397
Theology and religion	826	875
Juvenile books	273	331
Medical science, hygiene, etc.	189	211
Education, language, etc.	221	197
Poetry and drama, etc.	159	184
Biography, memoirs, etc.	184	161
Literary history and miscellany	165	159
Descriptive travel, etc.	138	153
Useful arts	67	146
History	118	119
Social and political science	112	106
Physical and mathematical science	106	90
Fine arts and illustrated books	91	75
Humor and satire	85	47
Sports and amusements	23	23
Domestic and rural	27	22
Mental and moral philosophy	21	15
Total	3,365	3,481

It need not be said that the bulk of the above quantity of books is of ephemeral value, or else of a professional and technical sort. In our rapid sketch of the publications of 1883 only the notable ones will be mentioned, and a dis-

inction made between the books written by American authors and those emanating from a foreign source.

Fiction.—Fiction is the most important class, both as regards the number of books and the high degree of literary excellence attained by many of them. F. Marion Crawford continued the notable success made in "Mr. Isaacs" by "Dr. Claudius" (Macmillan & Co.), and "To Leeward" (Houghton, Mifflin, & Co.). One of the most powerful novels of the year was "But yet a Woman" (Houghton, Mifflin, & Co.), by Prof. A. S. Hardy, which made a distinct mark on the literature of the year. Other memorable works of fiction which created considerable discussion both at home and abroad were Mrs. Burnett's "Through One Administration" (James R. Osgood & Co.); Bret Harte's "In the Carquinez Woods" (Houghton, Mifflin, & Co.); Howells's "A Woman's Reason" (James R. Osgood & Co.); Tourgee's "Hot Ploughshares" (Fords, Howard, & Hulbert); Constance Woolson's "For the Major" (Harper & Brothers); "Arius the Libyan" (D. Appleton & Co.); and "The Bread-Winners" (Harper & Brothers). The latter two novels were anonymous, and notable examples of imaginative work. The first-named novel gave a vivid picture of the conflicts and discussions of early Christianity and of the imperial court of Constantine. "The Bread-Winners" is noticeable as a study of some of the most interesting phases of contemporary life, equally marked by vigorous realism and delicacy of touch. Other novels by American authors worthy of mention were "Guenn, a Wave on the Breton Coast" (James R. Osgood & Co.), by Blanche Willis Howard; "Dust" (Fords, Howard, & Hulbert), and "Fortune's Fool" (James R. Osgood & Co.), both by Julian Hawthorne, and equally marked by great power and great defects; Miss Tinker's "Jewel in the Lotos" (J. B. Lippincott & Co.); Edgar Fawcett's "An Ambitious Woman," a well-written story of New York society (Houghton, Mifflin, & Co.); Frank Lee Benedict's "The Price She Paid" (J. B. Lippincott & Co.); "His Sombre Rivals," by E. P. Roe (Dodd, Mead, & Co.); "The Led Horse Claim," by Mary Hallock Foote (James R. Osgood & Co.); "The Priest and the Man, or Abélard and Héloïse," by William Wilberforce Newton (Cupples, Upham, & Co.); "Hand and Ring" (G. P. Putnam's Sons), by Anna Katharine Green; "A Castle in Spain," a posthumous novel by James De Mille (Harper & Brothers); "Stephen M. D.," by the author of "The Wide Wide World" (Robert Carter & Brothers); "Judith, a Chronicle of Old Virginia," by Marion Harland (Fords, Howard, & Hulbert); "A Washington Winter," by Mrs. Madeleine Dahlgren (James R. Osgood & Co.); "An Honorable Surrender," by Mary Adams (Charles Scribner's Sons); "A Newport Aquarelle," by Miss Maud Howe (Roberts Brothers); Miss Olney's "Fairy Gold" (J. B. Lippincott & Co.);

"A Fashionable Sufferer" (Houghton, Mifflin, & Co.) by Augustus Hoppin; "Mr. and Mrs. Morton," by a Bostonian (Cupples, Upham & Co.); "A Righteous Apostate," by Marchioness Lanza (G. P. Putnam's Sons); "A Woman of Honor," by H. C. Bunner (James R. Osgood & Co.); Edward King's "The Gentle Savage" (James R. Osgood & Co.); "Beyond the Gates," by Elizabeth Stuart Phelps (Houghton, Mifflin & Co.); and "The Diothas," anonymous (G. P. Putnam's Sons). Other anonymous novels worth mention are "His Second Campaign" and "Fanchette," added to the "Round Robin Series" (James R. Osgood & Co.); and "A Daughter of the Philistines" and "Princess Amélie," added to the "No Name Series" (Roberts Brothers). To American fiction for 1888 must also be added several collections of short tales of unusual excellence. These are "Dialect Tales," by Sherwood Bonner (Harper & Brothers); Henry James's "Siege of London and other Stories" (Houghton, Mifflin, & Co.); and "Nights with Uncle Remus," a continuation of Joel Chandler Harris's striking studies of Southern negro folk-lore (James R. Osgood & Co.). Among more prominent novels by English authors, reprinted by American publishers, were Rhoda Broughton's "Belinda" (D. Appleton & Co.); "Frescoes" and "Wanda," by Ouida (J. B. Lippincott & Co.); "Rossmoyne," by "The Duchess" (J. B. Lippincott & Co.); "Yolande" and "Shandon Bells," by William Black (Harper & Brothers); "King Capital," by William Sime (G. P. Putnam's Sons); Lucas Malet's "Mrs. Lorimer" (D. Appleton & Co.); "Donal Grant," by George MacDonald (D. Lothrop & Co.). To the "Leisure-Hour Series" (Henry Holt & Co.) have been added "A Great Treason" and "A Story of Carnival," by Mary A. M. Hoppus; "Gideon Fleyce," by H. W. Lucy; "Geraldine Hawthorne," by Beatrice M. Butt; "The Admiral's Ward" and "The Executor," by Mrs. Alexander; "No New Thing," by W. E. Norris; "In the Olden Time," by Miss Roberts; "Beyond Recall," by Adeline Sargent; and an anonymous novel, "A Chelsea Householder." "Homespun Stories," by Ascot R. Hope (D. Appleton & Co.), was a volume of striking short tales. Other noticeable English novels, which have been reprinted in the cheap libraries, such as the "Franklin Square," "Seaside," "Lovell's," etc., are Mrs. Forrester's "Jane," Mrs. Oliphant's "Sir Tom," "The Ladies Lindores," and "It was a Lover and his Lass," Hardy's "Romantic Adventures of a Milkmaid," Robert Buchanan's "Annan Water" and "Love Me Forever," Anthony Trollope's "Mr. Scarborough's Family" and "The Land-Leaguers," Frances E. Trollope's "Like Ships upon the Sea," Payn's "Thicker than Water," Mrs. Lynn Linton's "Ione Stewart," Besant's "All in a Garden Fair," Saunders's "A Noble Wife," Wilkie Collins's "Heart and Science," Shorthouse's "The Little Schoolmaster Mark,"

McCarthy's "The Maid of Athens," "My Trivial Life and Misfortunes" (anonymous), Mrs. Riddle's "A Struggle for Fame," Annie Thomas's (Mrs. Cudlip) "Jenifer," William Clark Russell's "A Sea Queen," Miss Macquoid's "Her Sailor Love," Miss Yonge's "Stray Pearls," Countess von Bothmer's "Aut Cæsar aut Nihil," Miss Taylor's "Senior Songman," Miss Betham Edwards's "Disarmed," and "Pearla," Laurence Oliphant's "Altiora Peto," Mary Cecil Hay's "Bid Me Discourse," and Miss Braddon's "Golden Calf" and "Phantom Fortune." To the above record may be added several translations from Continental authors, such as Daudet's "L'Évangéliste" (T. B. Peterson & Brothers); Mrs. Werner's "Banned and Blessed" (J. B. Lippincott & Co.); Mrs. Greville's "Guy's Marriage," and Zola's "In the Whirlpool" and the "Bonheur des Dames" (T. B. Peterson & Co.); Enault's "Christine," Richter's "Invisible Lodge," and Auerbach's "Master Bieland" (Henry Holt & Co.); Galdo's "Marienella," Dahn's "Felicitas," and Ebers's "A Word, only a Word" (W. S. Gottsberger); and a striking series, entitled "The Surgeon's Stories," from the Swedish of Topelius, including "Times of Gustaf Adolf," "Times of Battle and Rest," and "Times of Charles XII" (Jansen, McClurg, & Co.).

Biography.—The work of American writers in Biography was striking in extent and quality. "The Biography of William Oullen Bryant," by Parke Godwin (D. Appleton & Co.), was a judicious and elaborate study of a poet who made a foremost mark on American letters, and who was also one of the prominent journalists of the country. "The Autobiography of Thurlow Weed," edited by his grandson, Thurlow Weed Barnes (Houghton, Mifflin, & Co.), was an interesting revelation of a remarkable man; and Dr. Morgan Dix's "Memoirs of John Adams Dix" (Harper & Brothers) attracted deserved notice. Several valuable additions were made to the "American Statesman Series" (Houghton, Mifflin, & Co.). These were "Thomas Jefferson," by John T. Morse, Jr., "James Monroe," by D. C. Gilman, "Albert Gallatin," by John Austin Stevens, and "Daniel Webster," by Henry Cabot Lodge. "The Life of James Buchanan," by George Ticknor Curtis (Harper & Brothers), was an able if a somewhat one-sided study. Lyman Abbott's "Henry Ward Beecher" (Funk & Wagnalls) aimed to depict the aspect of the age which produced him as well as the man himself, a feature also noticeable in the "Autobiography of Charles Biddle" (E. Claxton & Co.), which was a vivid account of an interesting period of history. To the same period as the latter belongs Muzzey's "Reminiscences and Memorials of the Men of the Revolution." "Political Recollections," by Hon. George W. Julian (Jansen, McClurg, & Co.), gave an interesting sketch of public affairs and men from 1840 to 1872; and "Reminiscences of Public Men," by W. W. Perry, was a work of similar

field and value. Carroll's "Twelve Americans" (Harper & Brothers) attempted a sketch of representative men in different walks of life. Other works of considerable interest were "Recollections of a Drummer Boy," by Rev. Harry Keifer (James R. Osgood & Co.), a reminiscence of experiences during the late war; "Recollections of a Naval Officer," by W. H. Parker (Charles Scribner's Sons); "Memoir of John Keese, Wit and Littérateur," by William L. Keese (D. Appleton & Co.); "Abélard and Héloïse," by Mrs. Abby Sage Richardson (James R. Osgood & Co.), a new study of the two celebrated lovers; and Miss Titcomb's "Early New England People"; "Quincey's "Figures of the Past," and Lanman's "Leading Men of Japan." The latter-named book gave an entertaining account of people, institutions, and prominent personages in the most progressive empire of the East. Among religious biographies may be mentioned "Life of Adoniram Judson," by Edward Judson (Anson D. F. Randolph & Co.); "Autobiography and Letters of Orville Dewey, D. D.," by his daughter, Elizabeth Dewey (George H. Ellis), a study of an eminent orator and scholar; "Life and Mission of Emanuel Swedenborg," by Benjamin Worcester (Roberts Brothers); "Life of Bishop William Rollinson Whittingham," by William Francis Brand (E. & J. B. Young & Co.); and "Autobiography of Bishop Erastus O. Haven" (Phillips & Hunt), edited by Rev. Dr. C. C. Stratton. The year was rich in literary biography. F. H. Underwood's "Life of John Greenleaf Whittier" (James R. Osgood & Co.) was rivaled by a biography of the same poet by W. Sloane Kennedy (D. Lothrop & Co.). The latter-named biographer also wrote a "Life of Oliver Wendell Holmes" (S. E. Cassino & Co.). B. G. Lovejoy's "Life of Bacon" (Estes & Lauriat), George W. Cooke's "George Eliot" (James R. Osgood & Co.), Mrs. Julia Ward Howe's "Life of Margaret Fuller" (Roberts Brothers), Austin's "Life of Longfellow" (Houghton, Mifflin, & Co.), and Francis E. Cooke's "Theodore Parker" (Cupples, Upham, & Co.), were all books of more than ordinary value and literary charm. Other biographical studies to which attention may be called as possessing much political and historical interest are the "Life of Alexander H. Stephens," by Richard Malcom Johnson and William Hande Browne, and "The Life and Times of S. S. Prentiss," by Hon. Joseph D. Shields (J. B. Lippincott & Co.). Some other biographies worthy of mention are "Life of Adelaide Phillips," by Mrs. R. C. Waterson (A. Williams & Co.); Bucke's "Walt Whitman"; Waters's "Life of William Cobbett"; Grace Greenwood's "Queen Victoria" (Anderson & Allen); "Life of Gen. Ambrose E. Burnside," by Ben Perley Poore (J. A. & R. A. Reid); "The Washington Irving Correspondence," and Stone's "Our French Allies." The reprints by American publishers of biographical works written by English or other foreign authors

include many of signal value and interest. Among these, special attention may be called to "The Correspondence of Thomas Carlyle and Ralph Waldo Emerson" (Houghton, Mifflin, & Co.); "Letters and Memorials of Jane Welsh Carlyle," edited by J. A. Froude (Charles Scribner's Sons); Bosworth Smith's "Life of Lord Lawrence" (Charles Scribner's Sons); "Life, Letters, and Literary Remains of Edward Bulwer, Lord Lytton," by his son the Earl of Lytton (Harper & Brothers); "Anthony Trollope's Autobiography" (Harper & Brothers); Köstlin's "Life of Luther" (Charles Scribner's Sons); "Life and Achievements of Edward Henry Palmer," by Walter Besant (E. P. Dutton & Co.); Hall's "Retrospect of a Long Life" (D. Appleton & Co.); and Madame Gautier's "Richard Wagner" (A. Williams & Co.). To these should be added the new volumes in the "English Men of Letters Series" (Harper & Brothers), Morison's "Macaulay," Mrs. Oliphant's "Sheridan," and Dobson's "Fielding"; in the "Famous Women Series" (Roberts Brothers), Miss Thomas's "George Sand," Miss Mathilde Blind's "George Eliot," Mrs. Gilchrist's "Mary Lamb," Miss Robinson's "Emily Brontë," and Miss Helen Zimmern's "Maria Edgeworth"; in "English Classics," Fowler's "Shaftesbury and Hutchinson" (G. P. Putnam's Sons); in "Foreign Classics," Graham's "Rousseau" (J. B. Lippincott & Co.); and the "Life of Sir William Rowan Hamilton," by Robert Perceval Graves (J. B. Lippincott & Co.).

History.—In History, American literature in 1888 was noticeably rich. Among the earliest in publication, and certainly foremost in interest, was the "History of the People of the United States" (Vol. I), by John Bach McMaster (D. Appleton & Co.). In this work the author has followed the method of Macaulay and Green, and presented a vivid picture of American life in its customs, manners, social characteristics, etc. Probably no book of the year made a greater sensation. Another notable issue by the same house was a new and revised edition, thoroughly rewritten, of Bancroft's "History of the United States" (Vols. I, II, III). This contains the final touches of the author. Another work, similar in scope to that of McMaster's, is entitled "A History of the American People," by Arthur Gilman (D. Lothrop & Co.), and is marked by ability and research. "Mexico," by Hubert Howe Bancroft (Bancroft & Co.), was the first volume of the Spanish-American section of a gigantic undertaking, covering the ethnology and history of the whole region of the Pacific coast from British Columbia to the Isthmus of Panama. Noticeable among the histories was the literature of the late civil war. Foremost among these were volumes in the "Campaigns of the Civil War" series, and the "Navy in the Civil War" series, both published by Charles Scribner's Sons. "The Shenandoah Valley in 1864," by George E. Pond, was a judicious and vividly written work.

The "Virginia Campaign of 1864-'65," by Gen. A. A. Humphreys, was by an accomplished soldier, whose position as chief of staff and military attainments gave him a peculiarly favorable opportunity of judgment. The same author had also previously contributed "From Gettysburg to the Rapidan." The series was concluded by a "Statistical Record of the Armies of the United States," by Frederick Phistener, which gave all the figures, both in money and men, involved in the war. The naval series, supplementing the foregoing, consisted of three volumes, all published during the year. "The Blockade and the Cruisers," by J. Russell Soley, contributed an account of sea-coast operations, which is both trustworthy and well written. Admiral Daniel Ammen covered another section of the same field in "The Atlantic Coast," and "The Gulf and Inland Waters," by Commander Mahan, finished the series. The two series constitute a consecutive and, on the whole, very ably written history of the military and naval operations of the late war. There were other interesting contributions to war-literature in this department. Col. T. A. Dodge wrote "A Bird's-Eye View of our Civil War" (James R. Osgood & Co.), and from the same firm we had "Brook Farm to Cedar Mountain," by Gen. George D. Gordon. "Bullet and Shell," by George F. Williams, treated the war from the stand-point of the private soldier in a picturesque fashion (Fords, Howard, & Hulbert). Under the title of "The Secret Service of the Confederate States; or, How the Confederate Cruisers were equipped," by James D. Bulloch (G. P. Putnam's Sons), there was an interesting monograph, giving a great mass of hitherto unknown facts. Properly belonging to war-literature, too, was the "Diplomatic History of the Civil War," being the fifth volume of the "Works of William H. Seward," edited by George E. Baker (Houghton, Mifflin, & Co.), a book which will probably remain a permanent and standard authority. "Anecdotes of the Civil War," by Gen. E. D. Townsend, late adjutant-general, also possessed considerable historical value (D. Appleton & Co.). The "American Commonwealth" series (Houghton, Mifflin, & Co.) aims to cover a unique and important field, State histories in their relation to national history. Three volumes were issued in 1888: "Virginia, a History of the People," by John Esten Cooke; "History of Georgia," by Charles C. Jones, LL. D.; and "Oregon, the Struggle for Possession," by William Barrows. The latter work gives a succinct account of the narrow miss by which the United States escaped losing the enormous territory contained in Oregon and Washington Territory. A work of interest to statesmen, merchants, and political economists is found in the "Financial History of the United States," by Albert S. Bolles (D. Appleton & Co.). Not to be overlooked in the year's record of historical research is the series written and published under the auspices of the Johns

Hopkins University. These works touch the legal and institutional aspects of American history. Among them may be mentioned "Local Government in Illinois," by Albert Shaw; "Local Government in Pennsylvania," by E. R. L. Gould; "Local Government and Free Schools in South Carolina," by B. J. Ramage; "Local Government in Michigan and the Northwest," by E. W. Bemis; "Introduction to American Institutional History," by Edward A. Freeman; "Genesis of a New England State (Connecticut)," by Alexander Johnson; "Germanic Origin of New England Towns," by H. B. Adams; "Normal Constables in America," by H. B. Adams; "Parish Institutions of Maryland," by Edward Ingle; "Saxon Tithingmen in America," by H. B. Adams; and "Village Communities of Cape Ann and Salem," by H. B. Adams. These works will prove themselves exceptionally valuable to the philosophical student of history. Other works of local and antiquarian interest are, "A History of the Schenectady Patent in the Dutch and English Times," edited by Maj. McMurray, U. S. A.; "History of Bristol, R. I.," by Wilfrid B. Munro (J. A. & R. A. Reid); "History of Hardwicke, Mass.," by Lucius R. Paige (Houghton, Mifflin, & Co.); "History of the Union League of Philadelphia," by George Parsons Lathrop (J. B. Lippincott & Co.); and "Orderly Book of Sir John Johnson in 1777, during the Revolution," by W. L. Stone (Joel Munson's Sons). On the side of religious history several important contributions have been made by American historians. The first volume of Dr. Philip Schaff's "History of the Christian Church, Ante-Nicene Christianity, A. D. 100-325" (Charles Scribner's Sons), was issued. This is to be completed in four volumes. The "History of the Reformation," by Prof. G. P. Fisher, D. D., of Yale College (Charles Scribner's Sons), was the work of one of the most accomplished ecclesiastical scholars of the country. Rev. George A. Jackson's "Post-Nicene Greek Fathers" (Appletons' "Christian Literature Primers") was a concise sketch of more than ordinary interest. Other works in religious history were "History of Indian Missions on the Pacific Coast" (Am. S. S. Union); the "History of the Methodist Episcopal Church in the United States" by Rev. P. Douglass Garrie (John E. Potter & Co.); and the "History of the Episcopal Church in Connecticut," by Rev. Edward Beardsley, D. D. (Houghton, Mifflin, & Co.). A book which must not be overlooked, as bearing an important relation to the history of the country, is the Hon. G. P. Williams's "History of the Negro Race in the United States" (G. P. Putnam's Sons), notable as being the work of a negro scholar, marked by literary skill and research. Other histories of the year worthy of mention were, Prof. Herbert Tuttle's "History of Prussia" (Houghton, Mifflin, & Co.); "Mediæval Civilization," by G. B. Adams (Appletons' "History Primers");

"Mosaics of Bible History," and "Mosaics of Grecian History," by Marcous and Robert P. Willson (Harper & Brothers); "Pioneers of the Western Reserve," by Harvey Rice (Lee & Shepard); "Quaker Invasion of Massachusetts," by R. P. Hallowell (Houghton, Mifflin, & Co.); "Short History of Rhode Island," by George Washington Greene, LL.D. (J. A. & R. A. Reid); "Stories of American History," by C. M. Yonge and H. H. Weld (D. Appleton & Co.); and Stephens's "History of the United States," revised to 1883 (E. J. Hale & Son). An important series was begun under the general name of "Minor Wars of the United States" (Dodd, Mead, & Co.), and thus far includes Richard Markham's "King Philip's War," Rossiter Johnson's "War of 1812" and "Old French War," and Horatio O. Ladd's "War with Mexico."

Among the notable historical works by foreign authors published under an American imprint were Count de Paris's "History of the American Civil War," 3d volume (Porter & Coates); Sir Gavan Duffy's "Four Years of Irish History" (Cassell & Co.); "The Expansion of England," by J. R. Seeley (Roberts Brothers); Froude's "Short Studies on Great Subjects," 4th series (Charles Scribner's Sons); Freeman's "Impressions of the United States" (Henry Holt & Co.); Lacombe's "Growth of a People" (Henry Holt & Co.); "Frederick II and Maria Theresa," by Duc de Broglie (Harper & Brothers); "A History of Latin Literature," by George Augustus Simcox (Harper & Brothers); "Literary History of England" by Mrs. Oliphant (Macmillan & Co.); and "Huguenots of France," by H. M. Baird, and "Underground Russia," by Stepniak (Charles Scribner's Sons). The latter work gave a revelation of the interior character and workings of Nihilism from the stand-point of one of its most noted chiefs, Pierre Lavroff.

Travel.—In travel and description American authorship was quite fruitful. "Old Mexico and the Lost Provinces," by W. H. Bishop (Harper & Brothers), appears to have been careful in its facts as well as picturesque in its treatment. A similar volume devoted to old Spain, "Spanish Vistas," by G. P. Lathrop, was issued by the same house, and was notable both in its literary matter and illustrations. The popularity of the Spanish Peninsula as a field for the literary traveler is also shown in several other books by well-known authors. "A Family Flight through Spain," by Edward Everett Hale and Miss Susan Hale (D. Lothrop & Co.), professed to give the adventures of a traveling party consisting of father, mother, children, and one or two friends. Mr. Hale was also the author of "Seven Spanish Cities" (Roberts Brothers), which gave a graphic account of the principal centers of Spanish civilization. Henry Day's "From the Pyrenees to the Pillars of Hercules" (G. P. Putnam's Sons) was a cursory but readable sketch; and "In the Shadow of the Pyrenees,"

by Henry Vincent, conveyed much curious information concerning the hardy and half-savage race known as the Basques, who differ so widely from all the peoples of Western Europe. "Spanish Ways and By-Ways," by William Howe Downes (Cupples, Upham, & Co.), was attractive alike in its descriptions and illustrations; and "Through Spain on Donkey-Back," by Robert Louis Stevenson (D. Lothrop & Co.), recommended itself by freshness of observation. Howard Conkling's "Mexico and the Mexicans" (Taintor Brothers, Morrill, & Co.) was a work full of facts concerning the people, their institutions and resources, by an old resident. Among works of literary and philosophical travel, "A Walk in Hellas," by Denton J. Snider (James R. Osgood & Co.), possessed unquestionable merit. It treated Greece of to-day in the light of Greece of the past, and all those classic memories which make Hellenic soil memorable. Rev. H. M. Field, who has repute as an extensive traveler and a spirited writer, was represented in two new works, "Among the Holy Hills," and "On the Desert" (Charles Scribner's Sons). The latter-named work also contained a judicious study of the recent imbroglio in Egypt, which led to its possession by England. Mrs. A. K. Dunning's "Through the Desert" (Presbyterian Board of Publication) deserves passing mention; and "Among the Mongols," by Rev. J. Gilmour (American Tract Society), was a readable record of missionary experiences amid barbarian races. "From the Hudson to the Neva," by David Ker (D. Lothrop & Co.), embodied the experiences of a traveler in a romantic guise. "An American Four-in-Hand in Great Britain," by Andrew Carnegie (Charles Scribner's Sons), was a graphic and breezy record of a drive through Great Britain, from Windsor Castle to Inverness, Scotland, by a party of ladies and gentlemen. Adventures of a different sort, but hardly less interesting, were described in "Across the Continent with the Fifth U. S. Cavalry," by Captain George F. Price, U. S. A. (D. Van Nostrand & Co.). William Winter's "English Rambles" (James R. Osgood & Co.) recalled interesting literary and historic memories gracefully. One of the best books of the year was "Germany seen without Spectacles," by Harry Ruggles (Lee & Shepard), which was caustic and incisive, but apparently judicial. T. B. Aldrich, the poet, embodied his experiences during a vacation in "Ponkapog to Pesh" (Houghton, Mifflin, & Co.), the first name in the title being the location of the author's American country home, the latter the goal of his journey. "Round about Rio: A Picture of Life and Scenes in and about the Great Metropolis of the Southern Hemisphere, Rio Janeiro," by Frank D. Y. Carpenter (Jansen, McLurg, & Co.), indicated lively descriptive talent on the part of the young traveling naturalist. A book by Charles Dudley Warner, entitled "A Round-about Journey" (Houghton, Mifflin, & Co.), gath-

ered together the reminiscences of a protracted and leisurely journey through Europe and the East. A well-written account of Oriental travel was contributed by William W. Warren, under the title of "Life on the Nile in a Dahabieh" (Lee & Shepard). This work also included shore-excursions between Cairo and Assouan, and a tour in Egypt and Palestine in 1866-'67. "The Middle Kingdom," by Prof. Wells Williams (Charles Scribner's Sons), thoroughly revised and rewritten, was among the most important publications of the year, as it is, perhaps, the most exhaustive and thorough study of China, its history, institutions, and customs, easily available for the general reader. The painful interest which was kept at tension for many months in the case of the Arctic explorer De Long, turned deserved attention to the work edited by Mrs. Emma De Long, called "The Voyage of the Jeannette: The Ship- and Ice-Journals of George W. De Long, Lieutenant-Commander U. S. N., and Commander of the Polar Expedition, 1879-'81" (Houghton, Mifflin, & Co.). This pathetic record is the lost man's own story, and is one of the most interesting narratives of Arctic adventure and suffering written for many years. In connection with the above may be mentioned "Ice-Pack and Tundra," by W. H. Gilder (Charles Scribner's Sons), which described the experiences of the expedition sent out by the United States Government in search of Commander De Long's party. Among works of travel may be classed several noticeable books, which embodied reminiscences either of the author or of other travelers in a fictitious form, such as "Our Boys in China," by Harry W. French (Lee & Shepard); "The Bear-Worshippers of Yezo and the Island of Karafuto," by Edward Grey (Lee & Shepard); and "The Boy Travelers in Africa," by Col. T. W. Knox (Harper & Brothers). It need hardly be said that the latter three works were designed specially for the amusement and instruction of the young. Other books of travel and description were "On the Wing: Rambling Notes of a Trip to the Pacific," by Mary E. Blake (Lee & Shepard); "The Storied Sea," by Susan E. Wallace (James R. Osgood & Co.); "Travels and Observations in the Orient," by Hon. Walter Harriman (Lee & Shepard); and "Guide to Mexico," by Alfred R. Conkling (D. Appleton & Co.); Mark Twain's "Life on the Mississippi," and Stoddard's "Red-Letter Days Abroad" (James R. Osgood & Co.). The latter-named two books were among the literary successes of the year in their class.

The most noteworthy American reprints of foreign authors were Willis's "In the Land of the Lion and the Sun," James's "Wild Tribes of the Soudan" (Dodd, Mead, & Co.), Robinson's "Sinners and Saints" (Roberts Brothers), "A Visit to Ceylon and India," by Ernst Haeckel (S. E. Cassino & Co.), Miss Bird's "Golden Chersonese" (G. P. Putnam's Sons),

Symonde's "Italian By-Ways" (Henry Holt & Co.), "Egypt, Palestine, and Phœnicia," by Felix Bovet (E. P. Dutton & Co.), "John Bull and his Island," by Max O'Rell (Charles Scribner's Sons), and J. J. Rein's "Japan" (A. C. Armstrong & Son).

Poetry.—The additions to American poetry do not show marked development of poetic genius, or promise of forthcoming poets to take the place of those who long since won their spurs, and are one by one taking their leave of us. A few of the poetical ventures, however, show vigorous and genuine poetic quality. "Poems," by Jones Very (Houghton, Mifflin, & Co.), were marked by a subtle beauty and an insight into the analogies of physical and emotional life which attracted wide attention. "Songs of an Idle Hour," by William J. Coughlin (A. Williams & Co.), and "Songs of Toil and Triumph," by J. L. McCreary (G. P. Putnam's Sons), contained much verse marked by genuine feeling and some technical skill. A similar recognition may be extended to "Stray Chords," by Julia R. Anagnos (Cupples, Upham, & Co.), and "Verses," by Kate Vannah (J. B. Lippincott & Co.). "Lyrical Recreations," by Samuel Ward (Macmillan & Co.), may be fairly called American, though issued by an English publisher, and the verses were bright and agreeable, if in no sense great. Longfellow's "Michael Angelo" (Houghton, Mifflin, & Co.), if in no essential sense a dramatic poem, as apparently designed, displayed the finest qualities of the lamented poet's genius, with an even riper breadth of treatment. "Mercedes and other Lyrics," by Thomas Bailey Aldrich (Houghton, Mifflin, & Co.), had the delicate qualities of this author's verse, and Whittier's "Bay of Seven Islands, and other Poems" (Houghton, Mifflin, & Co.), showed no decadence in the aged Quaker poet's lyrical fire and tenderness. "Love Poems of Louis Barnaval," edited by Charles De Kay (D. Appleton & Co.), was noticeable for a somewhat tropical exuberance. W. W. Story's "He and She, or A Poet's Portfolio" (Houghton, Mifflin, & Co.), was a collection of poems marked by grace and strength. Taylor's "Dulce Domum" (S. C. Griggs & Co.) was a good piece of work by a well-known Western poet. "Love Poems and Sonnets," by Owen Innsly (Cupples, Upham, & Co.), and "Poems of Passion," by Ella Wheeler (Belford, Clarke, & Co.), possessed the merits of feeling and good treatment. Other poetic works, to which we can only give passing mention, were "Angeline," "Brangonar, a Tragedy," "Joan of Arc," "Mirabeau, a Historical Drama," "Sibyl," and "The Nazarene," all by George H. Calvert (Lee & Shepard); "Olaribel and other Poems," by Walter Malone (John P. Morton & Co.); "Destiny and other Poems," by M. J. Serrano (G. P. Putnam's Sons); "Elfrida, a Drama," by Dishon Rishell (J. B. Lippincott & Co.); "Legends, Lyrics, and Sonnets," by Frances L. Mace (Cupples, Upham,

& Co.); "Poems for Children," by Celia Thaxter (Houghton, Mifflin, & Co.); "Calumet of the Coteau," by P. W. Norris (J. B. Lippincott & Co.); and the Memorial edition of Bryant's poems, edited by Parke Godwin (D. Appleton & Co.). Among the numerous anthologies published may be specially mentioned "English Verse," edited by Linton and Stoddard, in five volumes (Charles Scribner's Sons), with a prefatory essay by Stoddard; "Fair Words about Fair Woman," edited by O. B. Bunce (D. Appleton & Co.); "Palgrave's Golden Treasury," revised and brought down to date by John Foster Kirk; and "Surf and Wave," by Anna L. Ward (T. Y. Crowell & Co.).

Productions of English poets reprinted by American publishers included several works of superior worth and beauty. Robert Browning's "Jocoseria" (Houghton, Mifflin, & Co.) was an excellent sample of his strong dramatic genius. Owen Meredith's "Poems and Lyrics of the Joy of the Earth" (by the Earl of Lytton) ranks well with his best work, and Edwin Arnold's "Indian Idyls" (Roberts Brothers) was one of the leading poetical productions of the year. In these idyls the author gave a noble English setting to many of the tales and legends given in the "Mahâbhârata," the well-known cycle of Sanskrit poems. Edmund Gosse's "On Viol and Flute" (Henry Holt & Co.), and Austin Dobson's "Old World Idyls and other Verses" (Scribner & Welford) were marked by the delicate and dainty touch characteristic of these poets. "Mano," by Rev. Richard Watson Dixon (George Routledge & Sons), was a poetical history of the time of the close of the tenth century, relating the adventures of a Norman knight, and possessed a quaint interest. Algernon Charles Swinburne's "A Century of Roundels" (R. Worthington) displayed all of this well-known poet's characteristic melody of form.

General Literature.—In general literature, including literary history, critical essays, and literary miscellany, were several notable publications. Sidney Lanier's "English Novel" (Charles Scribner's Sons) sketched the evolution of modern fiction from early literary forms. "Development of English Literature and Language," by Prof. A. H. Welsh (S. O. Griggs & Co.), was a contribution to literary history showing painstaking industry. M. W. Hazeltine's "Chats about Books," essays reprinted from the New York "Sun" (Charles Scribner's Sons), was a volume of noteworthy criticism. In "The Reading of Books," by Prof. Charles F. Thwing (Lee & Shepard), much valuable suggestion was given. John F. Genung made a contribution to critical literature in Tennyson's "In Memoriam, its Purpose and its Structure" (Houghton, Mifflin, & Co.). Oliver Wendell Holmes appeared in a fresh volume (Houghton, Mifflin, & Co.), "Pages from an Odd Volume of Life, a Collection of Essays, 1857-1881." "Books and how to use them," by J. C. Van Dyke (Fords, Howard, & Hulbert),

was a valuable manual of advice to readers and students. Joel Benton's "Emerson as a Poet" (M. L. Holbrook & Co.) was a study of the poetry of the "great transcendentalist" by an enthusiastic admirer. In "Pen-Pictures of Modern Authors" and "Pen-Pictures of Victorian Authors" (G. P. Putnam's Sons), W. Shepard sketched the lights of modern English literature. Prof. C. E. Norton edited the "Carlyle-Emerson Correspondence" (James R. Osgood & Co.), a book fascinating to all those interested in literature. James E. Freeman's "Gatherings from an Artist's Portfolio in Rome" (Roberts Brothers) embodied the more notable experiences of many years of foreign life. Brinton's "American Hero-Myths" was a contribution of value to the ethnology and history of North America prior to the coming of the white man. "Games and Songs of American Children," by W. W. Newell (Harper & Brothers), is worthy of attention for its interesting treatment of a novel subject. The second volume of Baldwin's "An Introduction to English Literature" effectually carries out the plan of the first. James Jackson Jarves's "Italian Rambles" (G. P. Putnam's Sons) was an attractive study of Italian art, life, and literature. One of the interesting books of the year was Josiah Quincy's "Figures of the Past, from the Leaves of Old Journals" (Roberts Brothers). Other books of interest were Arthur Penn's "Home Library" (D. Appleton & Co.), Wheeler's "By-Ways of Literature," "The Modern Sphinx," by M. J. Savage (George H. Ellis), "The Battle of the Moy, or How Ireland regained her Independence" (Lee & Shepard), "Short Studies in Literature," by A. P. Southwick, A. M. (Eldredge & Son), and "A Lost Function in Romance," by Carroll Bryce (G. P. Putnam's Sons).

The list of reprints of important English books is quite rich in noteworthy titles. Among these may be specially noted Ashton's "Humor, Wit, and Satire of the Eighteenth Century," "Early English Literature," by Bernhard Ten Broek (Henry Holt & Co.); "Characteristics," by A. P. Russell (Houghton, Mifflin, & Co.); "Classical and Modern Essays," by F. W. H. Myers (Macmillan & Co.); "Colin Clout's Calendar," by Grant Allen (Funk & Wagnalls); "English Literature in the Eighteenth Century," by Thomas Sargent Parry (Harper & Brothers); "Asbjornsen's Folk and Fairy Tales," translated by H. L. Brockstad (A. C. Armstrong & Son); Prof. Thistleton Dyer's "Folk Lore of Shakespeare" (Harper & Brothers); "Heroes and Kings, Stories from the Greek," by Rev. Alfred J. Church (Scribner & Welford); "In Strange Company," by James Greenwood (Scribner & Welford); "Landmarks of English Literature," by Henry J. Nicholl (D. Appleton & Co.); Lord Bacon's "Promus of Formularies," edited by Mrs. Henry Pott (Houghton, Mifflin, & Co.); Buckland's "Story of English Literature," Wagner's "Epics and Romances of the

Middle Ages," Simcox's "History of Latin Literature" (Harper & Brothers); Firdusi's "Epic of Kings," translated from the Persian by Mrs. Helen Zimmern (Henry Holt & Co.); Dr. David Pryde's "Highways of Literature" (Funk & Wagnalls); Ireland's "Book-Lover's Enchiridion" (Houghton, Mifflin, & Co.); Tourgueneff's "Poems in Prose" (Cupples, Upham, & Co.); Horne's "History of the Literature of the Scandinavian North," translated by Prof. Rasmus Andersen (S. C. Griggs & Co.); Blackie's "Wisdom of Goethe" (Charles Scribner's Sons); Macdonald's "Imagination and other Essays" (D. Lothrop & Co.); "Recollections of my Childhood and Youth," by Ernest Renan (G. P. Putnam's Sons); "Letters and Memorials of Jane Welsh Carlyle," edited by James Anthony Froude (Harper & Brothers); "Select Letters of Percy B. Shelley," edited by Richard Garnett (D. Appleton & Co.); Gosse's "Seventeenth Century Studies" (Scribner & Welford); "The Story of Ida," by Francesca, edited by John Ruskin (John Wiley & Sons); "The Story of My Heart," by Richard Jefferies (Roberts Brothers), and Bishop Thirlwall's "Letters to a Friend," edited by Dean Stanley (Roberts Brothers).

Science.—While the literary contributions to American science were not many, there were several of importance. "The Law of Heredity," by W. K. Brooks (John Murphy & Co.), was an acute and careful application of the Darwinian hypothesis to the facts involved in heredity, with much that indicated original research. It was one of the notable scientific books of the year. Prof. Alexander Winchell's "World Life, or Comparative Geology" (S. C. Griggs & Co.), made a valuable contribution to popular science, presenting leading geological facts in a fascinating manner. The same gift of popular exposition was characteristic of "Excursions of an Evolutionist," by John Fiske (Houghton, Mifflin, & Co.), a book likely to attract even non-scientific people by its charm of treatment. "Natural Instincts in Men and Animals," by P. A. Chadbourne, was a readable presentation of interesting facts. In "Our Northern and Eastern Birds" (R. Worthington), Edward A. Samuels offered a contribution to science, which will be prized by naturalists. The same field was largely covered by Stearn's "New England Bird-Life" (Lee & Shepard). Rev. J. H. Wythe, M. D., was the author of an interesting elementary treatise on "Easy Sermons in Vegetable Biology; or, Outlines of Plant-Life" (Phillips & Hunt). Another work on the same subject was "Wonders of Plant-Life," by Sophie B. Herrick (G. P. Putnam's Sons). Students of comparative anatomy and physiology will find a use for the "Hand-Book of Vertebrate Dissection," in three parts, elaborately illustrated, by Prof. H. Newell Martin, M. D., and Dr. W. A. Moale (Macmillan & Co.). "North America," by Prof. Hayden, U. S. Geological Survey, and Prof. Selwyn, F. R. S., of Canada

Geological Survey (Scribner & Welford), was a compendium of geography and travel. The more important scientific publications of the United States Government were "Cruise of the U. S. Steamship Corwin in Alaska and the Northwest Arctic Ocean, in 1881, with Notes on Glaciation, Natural History, and Anthropology," by John Muir, E. Nelson, and Dr. Irving Rosse"; "A History of the Inter-oceanic Canal Problem," by Lieut. J. S. Sullivan, U. S. Navy; "Twelfth Annual Report of the U. S. Geological and Geographical Survey of the Territories," by Capt. F. V. Hayden, U. S. Engineers, embracing Wyoming and Idaho, one volume being entirely devoted to the Yellowstone Park; "Report of the Fish Commission for 1880-'81-'82"; "Astronomical and Meteorological Observations made during 1879 at the U. S. Naval Observatory"; "An Account of the Progress of Astronomy in 1882," by Prof. E. G. Holden, of the Smithsonian Institution; and "Geology of the Comstock Lode and Washoe District," by George F. Becker.

The American issues of English scientific books, and of translations from Continental authors, were numerous and valuable. To the "International Scientific Series" (D. Appleton & Co.) were added "Animal Intelligence," by George J. Romanes, an excursion into the domain of what might be called the psychology of the lower orders of life; Joly's "Man before Metals," an investigation of the pre-historic human race; Hospitalier's "Modern Applications of Electricity," and "The Organs of Speech," by George Hermann von Meyer, a study of articulate sound. Frank Buckland's "Log-Book of a Fisherman and Zoologist" (Scribner & Welford) was a vivacious narrative; and Prof. Ray Lankester's "Degeneration, a Chapter in Darwinism," an able work, worthy of attention. R. A. Proctor, distinguished as a popular expositor, has added two books to his many, "Nature Studies" (Funk & Wagnalls) and "Mysteries of Time and Space." Vol. III of "Mathematical and Physical Papers," by George Gabriel Stokes M. A., D. C. L. (Macmillan & Co.), reprinted from the original papers and journals, was a valuable contribution to scientific literature. Among the important reprints special attention may be called to the "Northwest Coast of America" (Dodd, Mead, & Co.). This embodies the results of recent ethnological researches from the collections of the Royal Museum of Berlin, published by the directors of the ethnological department.

Politics, Economics, and Social Science.—In this domain there were a considerable number of noteworthy books from American authors. One of the ablest was by Lester F. Ward, entitled "Dynamic Sociology, or Applied Social Science" (D. Appleton & Co.). The book was a masterly argument in favor of greater centralization, or what is known as paternalism in government, and an attack on the *laissez*

faire theory of government and society. "French and German Socialism," by Richard S. Ely (Harper & Brothers), gave a comprehensive and well-studied sketch of the political and social theories which are now agitating the public mind, and of the men who have represented them prominently. The theory of "Land and Labor in the United States," by W. G. Moody (Charles Scribner's Sons), was based on opposition to monopoly, pursuing in some degree the plan proposed by Mr. George. The great interest felt in the study of economics was shown in the number of works published on political economy during the year. Though some of these seem to have been primarily designed for collegiate instruction, they were so written as to appeal to the interests of the general reader. Principal among these may be designated "Political Economy," by A. L. Perry (Charles Scribner's Sons), "Political Economy," by Dr. John M. Gregory (Van Antwerp, Bragg, & Co.), and "Political Economy," by Francis A. Walker (Henry Holt & Co.). The latter of these works, by one of the most accomplished statisticians in the country (late chief of the United States Census Bureau), attracted marked attention by its searching and vigorous treatment of economical questions. A book worthy of note, by its simple and lucid discussion of complex questions, was "What Social Classes owe to Each Other," by Prof. W. G. Sumner, of Yale College. As a brief statement of fundamental principles it could not easily be surpassed. Henry George, the well-known author of "Progress and Poverty," appeared in another work further amplifying the theory associated with his name, entitled "Social Problems" (Belford, Clarke, & Co.). Luther Henry Porter's "Outlines of the Constitutional History of the United States" (Henry Holt & Co.) was a noticeable review of the period antedating the adoption of our Constitution, the debates contingent on its discussion and adoption, and the changes which have since been made in it. "People and Politics," by E. W. Hosmer, M. D. (James R. Osgood & Co.), discussed the relations of people to government in an attractive way. In "Political Facts, a Text-Book of History," by George Fitch (John B. Piet & Co.), the author gave a history of parties and their conflicts in the United States. Other works relating to economics were "The Silver Dollar," by Henry Carey Baird (Henry Carey Baird & Co.), discussing the true standard of payment in the United States; "Taxation," by Prof. J. H. Canfield (G. P. Putnam's Sons), and "Labor and Capital," by Edward Kellogg (John W. Lovell & Co.). Part II of the "American Citizen's Manual," by W. C. Ford (G. P. Putnam's Sons), was a useful hand-book of information. Among publications of a general political character, attention may be properly called to "Works of James Abram Garfield," edited by Burke A. Hinsdale (James R. Osgood & Co.), and "Works of William H. Seward,"

edited by George H. Baker, a revised edition (Houghton, Mifflin, & Co.).

First among the works of foreign authors, reissued in the United States, must be placed Part VIII of Herbert Spencer's "Descriptive Sociology" (D. Appleton & Co.), published under the title of "The Social History of France." In this large folio are given the elements of French social development for the past two thousand years, classified and tabulated for the use of the general student. Sir Henry Maine's "Early Law and Custom" (Henry Holt & Co.) was an able dissertation on the evolution of law. Other publications which the student of public interests will find it worth while to investigate are "False Hopes," by Goldwin Smith (John W. Lovell & Co.); "Investigations in Currency and Finance," by W. Stanley Jevons (Macmillan & Co.); "New Golden Age and Influence of the Precious Metals upon the World," by R. Hogarth Paterson (Scribner & Welford); "Principles of Political Economy," by Henry Sidgwick, M. A. (Macmillan & Co.); "The Science of Politics," by Sheldon Amos, M. A. (D. Appleton & Co.'s "International Scientific Series"); T. M. Farrer's "State in its Relation to Trade" (Macmillan & Co.); "The English Village Community," by F. Seebohn (Scribner & Welford); and "Wealth Creation," by Augustus Mongredien, with an introduction by Simon Sterne (Cassell & Co.).

Philosophy and Metaphysics.—In this direction American thought was in some respects noticeable. "The Conflict in Nature and Life" (D. Appleton & Co.) was a strong work by an anonymous author, a study of the antagonism in the constitution of things, and an attempt to elucidate the problem of good and evil. In it the conclusion was reached that in neither optimism nor pessimism could the true philosophy of life be found, but rather in meliorism, or contentment with the best that might be practicable. Dr. Asa Mahan's "Critical History of Philosophy" (Philips & Hunt) gave a history of the development of metaphysical thought and theory, viewed from the Christian standpoint. S. Harris's "Philosophical Basis of Theism" (Charles Scribner's Sons) is a work which attracted even more attention in England than it did in the United States. "Energy, Efficient and Final Cause" (Scribner's "Philosophic Series," No. 2), by Rev. Dr. James McCosh, of Princeton College, is by one of the leading metaphysicians of the English-speaking world. "Kant's Critique of Pure Reason—a Critical Exposition," by Prof. George H. Morris, Ph. D. (S. O. Griggs & Co.), was Vol. I of "German Philosophical Classics." It attempts to elucidate the most abstruse and obscure of metaphysical systems. Vol. II in the same series is a critical exposition of "Schelling's Transcendental Idealism," by Prof. John Watson, LL. D. "Man a Creative First Cause," by Rowland G. Hazard (Houghton, Mifflin, & Co.), embodies two lectures de-

livered before the Concord School of Philosophy in July, 1882. Other works of some interest were "Evolution," by R. C. Adams (G. P. Putnam's Sons); "Evolution and Christianity," by J. F. Yorke (Henry Holt & Co.); "Philosophy and Christianity," by G. S. Morris (Carter & Brothers); and "Dynamic Sociology," by L. F. Ward (D. Appleton & Co.).

The most notable of foreign works in this department of thought reissued in the United States was Dr. Henry Maudsley's "Body and Will" (D. Appleton & Co.). As an exposition of scientific materialism it must take a high rank, though the logic of the author leads to a dreary pessimism. Two works by the well-known French metaphysician, Paul Janet, entitled "Final Causes" and "Theory of Morals" (Charles Scribner's Sons), were also among the important contributions of the year to philosophy. The author finds the *rationale* for the notion of final cause in the contemplation of the moral order of the human mind. In his theory of ethics M. Janet agrees with Bentham and Herbert Spencer, in assuming that the moral sense presupposes an experience of pleasure or advantage to be derived from virtuous action, but goes further, and asserts with Kant that the autonomy of the will must finally legislate over the moral world. The seventh volume of "Philosophic Classics for English Readers" introduces us to a study of "Hegel" by Prof. Edward Caird (J. B. Lippincott & Co.). It was edited for American publication by William Knight, LL. D. "Spinoza's Ethics," translated from the Latin by William Hale White (Scribner & Welford), is accompanied by a critical dissertation and brings a little-known but great thinker within the reach of American readers.

Religion.—The works issued in the department of theology and religion included many volumes of sermons and biblical commentaries. Only a few of the latter, such as can be regarded as important contributions to religious study, will be mentioned. Dr. G. T. Ladd's "Doctrine of Sacred Scriptures" (Charles Scribner's Sons) was a scholarly and able statement of the orthodox deductions; "Grounds of Theistic and Christian Belief," by Dr. G. P. Fisher (Charles Scribner's Sons), presented the logic of religion as against agnosticism; "Critique of Design-Arguments," by Dr. L. E. Hicks (Charles Scribner's Sons), covered the ground of natural theology very fully; Baker's "Ten Theophaues" (Houghton, Mifflin, & Co.) gave an historical study of the appearances of divinity to man as revealed in the religions of the world; Vol. II of Dr. Philip Schaff's "History of the Christian Church" (Charles Scribner's Sons) was devoted to the ante-Nicene period of Christianity, A. D. 100-325. From the same publishers, and under the editorial supervision of the same author, came Vols. IV and V of the "International Revision Commentary on the New Testament." Dr. Schaff, in connection with Rev. Dr. J. Fulton,

also edited the "Index Canonum" (E. & J. B. Young & Co.), being the Greek text, with a translation and a complete digest of the code of canon law of the early Christian Church before it was divided. The editorial labor of Dr. Schaff also appeared in the "Companion to the Greek Testament and the English Version" (Harper & Brothers); Schermerhorn's "Sacred Scriptures of the World" (G. P. Putnam's Sons) is a study of the sacred books of the great religions. Religious histories of considerable interest were issued in Allen's "Christian History in the Three Great Periods," and Part II of Rev. James Freeman Clarke's "Ten Great Religions," devoted to a comparison of all religions (Houghton, Mifflin, & Co.). Charles Nordhoff's "God and the Future Life" (Harper & Brothers) discussed the theory of Christian immortality. The "Scriptural Idea of Man," by Dr. Mark Hopkins (Charles Scribner's Sons), describes its contents accurately in the title. "Jesus, the World's Saviour," by Dr. Lorimer (S. C. Griggs & Co.), was a popular exposition of the theology of the Atonement. "Molinos, the Quietist," by John Bigelow (Charles Scribner's Sons), sketched the career of a remarkable figure in the mediæval Church; and "Golden Thoughts, by Miguel Molinos," was the title of a collection from the teachings of the same religious enthusiast, published by the same firm. P. C. Mozoomdar's "Oriental Christ" (George H. Ellis) presented the views of a Hindoo thinker on Christology in a singularly suggestive manner. "The Philosophical Basis of Theism," by Dr. Samuel Harris (Charles Scribner's Sons), was an examination of the personality of man with reference to his capacity to know and serve God. Bishop Samuel Harris's "Relation of Christianity to Civil Society" (Bohnen Lectures for 1888) was a valuable contribution to current religious discussion (T. Whittaker). The works of the Rev. Orville Dewey, the celebrated Unitarian preacher, including a new life, were issued by the American Unitarian Association. Rabbi J. M. Wise was the author of "Judaism and Christianity," and of "Moses, the Man and Statesman" (Bloch & Co.). From Dr. J. H. Green came a study of Old Testament history, also under the title of "Moses and the Prophets" (Robert Carter & Brothers). The last volume of "Yale Lectures on Preaching," delivered annually in the Divinity Course at Yale College, was by President E. G. Robinson (Henry Holt & Co.).

In Dr. James Strong's "Irenics" (Phillips & Hunt), a series of six volumes, the theologian attempted to show the virtual agreement between science and the Bible, Nature and the supernatural, the divine and the human in Scripture, the Old and New Testament, Calvinism and Arminianism, and divine benevolence and future punishment. "Bible Theology and Modern Thought" is the title of a work by T. L. Townsend (Lee & Shepard), setting forth the relative position of these two great forces in the conflict of modern opinion.

Rev. George A. Jackson's "Post-Nicene Greek Fathers" (D. Appleton & Co.) sketched the patristic literature and its authors, A. D. 325-370. "Gates into the Psalm Country," by Dr. M. R. Vincent (Charles Scribner's Sons), was an interesting study of the Davidic literature of the Old Testament. "Foundations of Religious Belief" (Bishop Paddock Lectures, 1883), by Dr. W. D. Wilson (D. Appleton & Co.), was the title of a collection of theological addresses to seminary students. Books which attracted more than ordinary attention were "Right and Wrong Uses of the Bible," by Rev. Heber C. Newton (John W. Lovell Co.), and Dr. Morgan Dix's "Lectures on the Calling of a Christian Woman" (D. Appleton & Co.). "Epochs of Church History," by Dr. E. A. Washburne (E. P. Dutton & Co.), treated of the great periods of ecclesiastical growth. Rev. W. C. Gladden's "Christian League of Connecticut" (Charles Scribner's Sons) discussed the possibilities of a union of sects in religious work. "English Style in Public Discourse," by Prof. Austin Phelps (Charles Scribner's Sons), was a capable manual of pulpit rhetoric. Other works dealing with the philosophical and didactic sides of theology and religion, worthy of mention, were "Atheism and Theism," by Rev. John Wilson (J. B. Lippincott & Co.); "Beliefs about the Bible," by Rev. M. J. Savage (George H. Ellis); Little's "Biblical Lights and Sidelights"; Briggs's "Biblical Study"; "Certitude, Providence, and Prayer," by Dr. James McCosh (Charles Scribner's Sons), a metaphysical study of the reasons for faith and devotion; "The Church Idea," by Dr. W. R. Huntington (E. P. Dutton & Co.), an essay on Christian unity; Sherwood's "History of the Cross" (Funk & Wagnalls); "The Doctrine of Probation, examined with Reference to Current Discussion," by Dr. G. H. Emerson (Universalist Publishing Co.); "Mystery of Creation and Man," by Dr. L. C. Baker (J. B. Lippincott & Co.); "The Outermost Rim and Beyond," by Charles Van Norden (A. D. F. Randolph & Co.); and Dr. J. G. Adams's "Inner Life" (Universalist Publishing Co.). The following were the principal collections of sermons and lectures published during 1888: Dr. Taylor's "Contrary Winds, and other Sermons" (A. O. Armstrong & Co.); "Lectures and Addresses," by Dr. Thomas Guard (Phillips & Hunt); "Principles of Agnosticism applied to Evidences of Christianity," by Dr. J. A. Harris (Thomas Whittaker); "The Radical Pulpit: Discourses in Advanced Thought," by Dr. O. B. Frothingham and Felix Adler (Truth-Seeker Co.); "Sermons," by Rev. William Cooper Mead (Dodd, Mead, & Co.); "Sermons on Future Punishment," by Dr. Randolph McKim (Thomas Whittaker); "Sermons from Plymouth Pulpit," by Henry Ward Beecher (Fords, Howard, & Hulbert); "Sermons on the Higher Life," by Dr. L. E. Dunn (Walden & Stowe); "Sermons preached in English Churches," by Rev. Phillips Brooks (E. P. Dut-

ton & Co.); and "Sermons," by Rev. David Swing (Jansen, McClurg, & Co.).

The more important works by British and foreign authors issued under American imprint were: "An Analysis of Religious Belief," by Viscount Amberley (Truth-Seeker Co.); Dr. Robson's "Bible: Its Revelation, Inspiration, and Evidences" (Thomas Nelson & Sons); Dr. Oldenberg's "Buddha," translated by William Hoey; "Boy Life: Its Trial, Strength, and Fullness—Sundays in Wellington College, 1859-'73," by his Grace the Archbishop of Canterbury (Macmillan & Co.); Dr. Gebhard Ullhorn's "Christian Charity in the Ancient Church" (Charles Scribner's Sons); Crass's "Coals from the Altar" (Thomas Whittaker); Bithell's "Creed of a Modern Agnostic" (George Routledge & Sons); "Dorner on the Future State," edited by Dr. Newman Smyth (Charles Scribner's Sons)—an admirable statement of the orthodox views on eschatology; Canon Farrar's "Early Days of Christianity" (Cassell & Co.); Cardinal Manning's "Eternal Priesthood" (John Murphy & Co.); Dr. McLearn's "Evidential Value of the Holy Eucharist: Boyle Lectures, 1870-'80" (Macmillan & Co.); Dr. Hefele's "History of the Councils of the Church," Vol. III, A. D. 431-455 (Scribner & Welford); Matthew Arnold's "Isaiah of Jerusalem" (Macmillan & Co.); "Luther and other Leaders of the Reformation," by Principal Tullock (Scribner & Welford); Zschokke's "Meditations on Life, Death, and Eternity," translated by Frederica Rowen (Houghton, Mifflin, & Co.); Beard's "Reformation of the Sixteenth Century," and Monier Williams's "Religious Thought and Life in India" (Scribner & Welford); "Rivers of Life; or, Sources of the Faiths of Man in All Lands," by Gen. J. G. R. Furlong (J. W. Bouton); "Sermons and Discourses," by the late Dr. McHale, Archbishop of Tuam (Catholic Publication Society); Dean Stanley's "Sinai and Palestine" (A. O. Armstrong & Co.); "Sacred Books of the East," Vols. XVIII, XIX (Macmillan & Co.); Dr. Bernhard Weiss's "Life of Christ" (Scribner & Welford); "The New Testament Scriptures: Their Claim, History, and Authority—Croall Lectures for 1882," by Dr. A. H. Charteris (Robert Carter & Brothers); and "Sermons," by Rev. C. H. Spurgeon, consisting of "Saint and Saviour," "The Present Truth," "Types and Emblems," "John Ploughman's Talks," "John Ploughman's Pictures," "The Treasury of David," and "Gleanings among Sheaves" (Robert Carter & Brothers); Herzog-Schaff's "Religious Cyclopædia," Vol. II (Funk & Wagnalls); and Mollvaine's "Wisdom of Holy Scriptures" (Charles Scribner's Sons).

Law.—The principal American law books were "Abbott's Supplementary Digest to the New Edition Digest" (Baker, Voorhis, & Co.); Phillips's "Treatise on the Law of Mechanics' Lien" (John D. Parsons, Jr.); Vol. II of "American Probate Reports" (Baker, Voorhis, & Co.); Vols. XIV and XV of "Blatch-

ford's U. S. Circuit Court Reports" (Baker, Voorhees, & Co.); "Great Opinions by Great Judges," by William L. Snyder, and "Law of the Federal Judiciary" (Baker, Voorhis, & Co.); Hein's "New York Supreme Court Reports," Vols. XXVIII and XXIX (W. C. Little); "Laws of Marriage," by Dr. John Fulton (E. & J. B. Young & Co.); Martin's "History of the Bench and Bar of Philadelphia" (Rees, Welsh, & Co.); Bliss's "New York Code of Civil Procedure" (Baker, Voorhis, & Co.); "The Law of Descent," by Anson Bingham (John D. Parsons, Jr.); and "The Law of Divorce," by H. Hargreaves (Bradstreet & Co.); and the following works issued by the United States Government: "Decisions of the Department of the Interior, July 1, 1881, to June 30, 1883"; "Proceedings of the Second Trial of the Star Route Cases," published in four volumes; "Statutes at Large of the United States, from December, 1881, to March, 1888. Together with "Recent Treaties"; and "Richardson's Reports of Decisions U. S. Court of Claims, December Term, 1882."

Medical.—The American medical works of most importance published in 1888 were Merrill's "Digest of Materia Medica and Pharmacy," and Mann's "Manual of Psychological Medicine and Allied Nervous Diseases" (P. Blakiston, Son, & Co.); "A Treatise on Insanity in its Medical Relations," by Dr. W. A. Hammond; Bartholow's "Therapeutics," a new edition (D. Appleton & Co.); and Sayre's "Lectures on Orthopedic Surgery and Diseases of the Joints" (D. Appleton & Co.); Vol. III of "The Principles and Practice of Surgery," by Dr. D. Hayes Agnew (J. B. Lippincott & Co.); Stearns's "Insanity—Its Causes and Prevention" (G. P. Putnam's Sons); "Physical Exploration of the Lungs," by Dr. Austin Flint (Henry C. Lea's Sons & Co.); and Part III of the surgical volume of the "Medical and Surgical History of the War of the Rebellion" (United States Government).

Miscellaneous.—Among books of interest, not classified above, the following may be noted: "Music in America," by F. L. Ritter, and "Music in England," by the same author (Charles Scribner's Sons), both comprehensive studies by a competent critic and historian; "Troja: Results of the Latest Research and Discoveries on the Site of Homer's Troy," by Dr. Henry Schliemann (Harper & Brothers); "A Little Girl among the Old Masters," a bright book on art for young people, by W. D. Howells (James R. Osgood & Co.); "History of Ancient Sculpture," by Mrs. Lucy M. Mitchell (Dodd, Mead, & Co.); "Historical Handbook of Italian Sculpture," by C. O. Perkins, a compact sketch of the rise and decadence of the plastic arts in Southern Europe (Charles Scribner's Sons); "Talks on Art," by W. G. Hunt (second series), the opinions of one of the most intellectual and suggestive of American artists (James R. Osgood & Co.); Clara Erskine Clement's "Outline History of Painting" (James R. Osgood & Co.); "A Fashion-

able Sufferer, or Chapters from Life-Comedy," a satire by Augustus Hoppin (Houghton, Mifflin, & Co.); "A Midsummer Lark," by W. H. Croffut, a humorous book of travel (Henry Holt & Co.); "The Battle of Coney Island, or Free Trade overthrown," by an Eye-Witness (J. A. Wagenseller); and "Why We Laugh," by Hon. S. S. Cox (Harper & Brothers). Among valuable Government publications may be mentioned various volumes connected with the Tenth Census Report, "Statistics of the Population of the United States," "Compendium of the Tenth Census," in two volumes; "Manufactures of the United States, Tenth Census, 1880," and "Productions of Agriculture, Tenth Census, 1880"; "Report of the Director of the Mint on Precious Metals"; and Vols. VIII and IX of "The War of the Rebellion," a compilation of the official record of the Union and Confederate armies.

LITERATURE, BRITISH, IN 1888. An examination of the list of books published in Great Britain brings to light no work of startling merit and novelty, though many have appeared which are important, and which aid in giving the year a favorable standing in the history of literature. Following will be found those more significant works in the different classes, original and translations, which have specially attracted attention:

Theology and Religious Literature.—The Gospels and Epistles have been published, with annotations, in Dr. Plummer's "St. John," Dr. Westcott's "Epistles," Canon Farrar's "Epistle to the Hebrews," in which he claims the authorship for Apollos, differing, therefore, with many of the leading modern as well as ancient scholars. Dr. Maclear has annotated the "Gospel of St. Mark," and Dr. Godet the "Epistle to the Romans." Dr. Joseph Parker has written a study of the "Inner Life of Christ," Dr. Charteris has published six lectures in defense of "The New Testament Scriptures," and Dean Stanley has published his "Addresses and Sermons" delivered in America. Canon Freemantle's work on "The Gospel of the Secular Life" is notable; Rawlinson's "Religions of the Ancient World" is a valuable contribution to the history of theology; as is also Dr. Moffat's "Church in Scotland." An important addition to extant histories of the Order of Jesus is "The Records of the English Province" of the order by Mr. Foley, the English Jesuit; while Dr. Griesinger has issued a complete history of the Jesuits from an adverse stand-point. Dr. McHale has issued his work on "The Roman Catholic Archbishops of Tuam"; the collection of English diocesan histories has been extended; and Mr. Stanley Lane-Poole has written on Mohammedanism, in eight papers collected under the title of "Studies in a Mosque."

Biography and History.—These subjects, as usual, have been largely treated. The "English Men of Letters" series includes the names, for the year, of Macaulay, Sheridan, Fielding, and

Addison. The third volume of the "Life of Bishop Wilberforce" completes the work; Dean Swift's Life has been written by Mr. Henry Craik; and an edition of the "Letters of Shelley" is edited by Mr. Richard Garnett. Of course the publication of Mr. Froude's "Letters and Memorials of Mrs. Carlyle," and of the Carlyle-Emerson correspondence, attracted general attention and discussion. Dean Bradley's "Recollections" of Dean Stanley, and Bishop Thirlwall's "Letters," have also awakened much public interest. The occurrence of the fourth centenary of Luther drew from Mr. Froude a short sketch of the great reformer; and the "Life of Luther," by Köstlin, has appeared in several editions. Among works of special interest are the sketches of Arthur Hugh Clough, by Waddington; Augustus De Morgan, the renowned mathematician, by his wife; Prof. Clerk Maxwell, by Oliver Madox Brown; and Dante Gabriel Rossetti, by Sharp. There have appeared also lives of Hegel, Shaftesbury, Hutcheson, Hamilton, and of the Greek Philosophers, as the year's contribution to philosophical biography. In science, besides the collection of "Heroes of Science," there have been published Dr. Smiles's "Life of Nasmyth," the "Life of Sir William Logan," geologist, and the "Memoir of John Duncan," who was a Scotch botanist. The field of historical biography was largely covered in 1888: The "Life of Don John of Austria," by Sir William Sterling Maxwell; "Life of Sir Henry Durand"; the "Lords Advocates of Scotland from the Close of the Fifteenth Century"; the "History of Marie Stewart," by her secretary, Claude Nau, now first printed from the original manuscript; Madame Junot's "Memoirs"; the "Life of Lord Hawke," admiral of the fleet under George II; the "Diaries and Letters of Philip Henry," and the "Diary of Richard Coeka," who was a merchant in Japan in the seventeenth century. The autobiographies of Anthony Trollope and Sir Archibald Alison are the most important of the literary biographies; while the "Retrospect of a Long Life," by S. O. Hall, has hardly attracted less attention than these. Mr. Percy Fitzgerald's "Royal Dukes and Princesses of the Family of George III," and his sketches of "Kings and Queens of an Hour"; Grace Greenwood's "Life of Queen Victoria"; Mr. Gladstone's life, with contemporaneous biography of eminent men, by Thomas Archer; and C. R. Low's "Life of General Wolsley," are to be enumerated; and Thomson's "Life of Bewick," the engraver, and Archer's "English Dramatists of To-Day," conclude our selections from among the biographical works.

In history, specifically, the leading publication is the continuation of the voluminous series of "Historical Papers," which does not lessen either in interest or importance. The "History of London," by Loftie, bears evidence of industry and painstaking. Mr. J. R. Seeley has written "The Expansion of England"; English county history has received accessions

in Mr. Mason's "Norfolk," Watson's "Roman Lancashire," and Fleet's "Glimpses of our Ancestors in Sussex." Irish history is recounted by Rev. Dennis Murphy, in "The History of Cromwell's Irish Campaign," and Sir Gavan Duffy's "Four Years of Irish History"; "London under the Four Georges" is written about by Mr. Fitzgerald Molloy. Lord Stratford's "Campaign in the Crimean War" has been described by Skene, Sir William Muir's account of "The Early Caliphate" should be noted, and the list closes with Brassey's "History of the British Navy."

Travel and Adventure.—America, during 1888, was specially favored by English tourists, and we have three works giving the account of their journeyings. Mr. Edward A. Freeman's "Impressions," perhaps, attracted the most attention of the three; Mr. Phil Robinson's "Saints and Sinners" gives a rather favorable view of Mormon life; and Mr. T. S. Hudson describes lightly the country he traversed in his "Scamper through America." Mr. Freeman's "English Towns and Districts," Mr. George Augustus Sala's "Living London," and Richard Jefferies in his "Nature near London," perform the same task for England. Spain has been discussed by Gallenga in "Iberian Reminiscences," and in Mrs. Middlemore's "Stories round a Posada Fire." Mr. R. L. Stevenson has given an account of canoe-travel on the rivers of France, in "An Inland Voyage." Mrs. Burnaby has written "The High Alps in Winter." "In the Alsatian Mountains," by Katharine Lee, "On Summer Seas," by Mrs. Scott Stevenson, and Mr. A. J. O. Hare's "Cities of Southern Italy and Sicily," with the "Walk in Hellas," of Mr. Snyder, are specimen books of Continental travel. Mr. John Geddie's "Historical and Descriptive Account of Russia," and a translation from the Polish, entitled "Siberian Pictures," conclude the volumes of European travel. The East has been liberally described in a number of interesting works: "Moorish Lotus-Leaves" is the rather fanciful title of a book by Messrs. Cowan and Johnson. Cairo is considered in "Five Months at Cairo and in Lower Egypt," by Gabriel Charnes, and Miss Whateley's "Scenes from Life in Cairo." The subject of pyramid study is advanced in Mr. O. Staniland Wake's "The Origin and Significance of the Great Pyramid," and Mr. Petrie's "The Pyramids and Temples of Gizeh." "Egypt and the Egyptian Question," by Mr. Mackenzie Wallace, created a sensation in England by its plain treatment of the subject. Capt. Burton and Commander Cameron's "To the Gold Coast for Gold," Col. Durnford's "A Soldier's Life in South Africa," Mr. Mitford's "Through the Zulu Country," Mr. Ellis's "Land of Fetish," and Rev. Mr. MacDonald's "Africana," are the principal works in African travel. Two books which have been generally praised are Miss Bird's "Golden Chersonese," and Prof. Haack-

el's "Visit to Ceylon." Mrs. Murray-Aynsley has described "Our Tour in Southern India," and Mr. Tolmer has issued his very entertaining volume of "Reminiscences." "The Land of the Lion and the Sun," by Dr. Wills, and "Across Chrysé," by Mr. Colquhoun, are also volumes of Asiatic travel. General voyaging has been described in a number of pleasing works, including "The Voyage of the Wanderer," Mrs. Bridge's "A Lady's Travels round the World," Dr. Coppinger's Pacific "Cruise of the Alert," Miss Gordon Cumming's "Fire Fountains," being her account of a visit to the Sandwich islands, Mr. Bradshaw's "New Zealand as it is," and Powell's "Among the Cannibals of New Britain."

Science.—Philosophy and social science have been treated by some of the leading thinkers of the day: Mr. Herbert Spencer has published the fifth part of his "Political Institutions," Mr. Sidgwick has issued his "Principles of Political Economy," and other works in these directions are Mongredien's "Wealth Creation," Farrer's "The State in its Relation to Trade," and the "Free-Trade Speeches" of the Rt. Hon. C. P. Villiers. More strictly philosophical are "The Ultimatum of Pessimism," by James William Barlow; "Prolegomena to Ethics," by the late T. H. Green; Dr. Pressensé's "Study of Origins," Spinoza's "Ethics," translated by W. H. White, Mr. W. D. Ground's examination of Herbert Spencer's "Structural Principles," Mr. Courtney's "Studies in Philosophy," Mr. Gostwick's "German Culture and Christianity," and Mr. Stackenburgh's "Life of Kant." In the literature of evolution we have Hick's "Critique of Design Arguments," Cobbe's "Darwinism in Morals," Wilson's "Chapters on Evolution," and Zimmerman's "Theories of Darwin." Socialism is reviewed in Kaufman's "Socialism and Communism in their Practical Application," "French and German Socialism in Modern Times," by Ely; and Jevons's "Methods of Social Reform." An important work on international law is "The Rise and Growth of the Law of Nations," by Mr. John Hosack. The subjects in natural science have been considered in a number of prominent works: first among these are the two volumes continuing the series of official reports of the "Voyage of the Challenger"; Martin Duncan has published a popular "Natural History" in six volumes. The prolific Mr. Proctor has published a volume which he calls "Nature Studies," and an essay on "The Great Pyramid," in which he combats the theories of its occult intent. Mr. Francis Galton has continued his peculiar line of investigation in "Human Faculty," a collection of essays. Miscellaneous works in various departments of science are Marshall's work on "The Frog," Hopley on "Snakes," Wall's "Indian Snake-Poisons," "Gold, its Occurrence and Extraction," by Lock; "Glass in the Old World," by Wallace-Dunlop; and "Man before Metals," by Joly.

In language and literature we have had a large number of notable works, general and special. Of the first of these should be mentioned Anna Buckland's "Story of English Literature," and Mr. T. S. Perry's "Essays on English Literature," Mr. Saintsbury's "Short History of French Literature," Horn and Anderson's "Scandinavian Literature," and Mr. Gosse's "Seventeenth Century Studies" in English poetry. An addition to the Bacon controversy has been made in the publication of Mrs. Pott's edition of Bacon's "Promus of Formularies and Elegancies," designed to display the frequent appearance in Shakespeare's writings of mannerisms peculiar to Bacon. Dr. Ingleby has written "Shakespeare's Bones," with a view to encourage the examination of the great dramatist's grave. "Shakespeare as an Angler," and "Shakespeare as a Lawyer," have been studied by Rev. H. N. Ellacombe and Mr. Heard, respectively. "Notes on Shakespeare's Plays," by Mrs. Kemble, "Animal Lore of Shakespeare's Time," by Emma Phipson, and "Shakespeare's Flora," by L. H. Grindon, are further efforts toward the elucidation of these subjects. "Gay's Fables," with a memoir, have been edited by Mr. Dobson, and "Milton's Sonnets" by Mr. Pattison. A "Sketch of French Literature" has been published by Mr. Saintsbury, who has also edited a collection of "French Lyrics" for the Parchment Library. G. Vigfusson and F. York Powell have issued a volume of "Old Northern Poetry," reaching to the thirteenth century. Mr. M. T. Tatham has made a prose translation of the "Philoctetes" of Sophocles, and Mr. Morshead has translated into English verse "The Suppliant Maiden" of Æschylus. Mr. C. A. M. Fennell has edited Pindar's "Nemean and Isthmian Odes," and a prose translation of Dante's "Purgatorio," by the late W. S. Dugdale, has been published with the original text. Mr. Sellar's "Roman Poets of the Augustan Age," and Mr. Simcox's "History of Latin Literature," complete our citations of the classical work of the year. The "Encyclopædia Britannica," revised edition, has reached its sixteenth volume (M), and Dr. Ogilvie's "Imperial Dictionary" has appeared in a new edition. The second volume has appeared of "The Halkett and Laing Dictionary of Anonymous and Pseudonymous Literature." Mr. W. J. Van Eys has issued the first grammar ever published in English of the Basque language.

Works on Art.—Perrot and Chipiez's works on "Art in Ancient Egypt," and "Art in Chaldæa and Assyria," deserve the first notice in this department. Other works of interest are Scott's "Renaissance of Art in Italy," Mrs. Clement's "Outline History of Painting," Mr. Wilmot Buxton's "English Painters," Lucy Crane on "Art and the Formation of Taste," Mr. Ruskin's four Oxford lectures on the "Art of England," and Tristram Ellis's "Sketching from Nature." Somewhat more practical in

character is Wheatley and Delamotte's "Art-Work in Porcelain, Gold, and Silver."

Poetry and Essays.—The year has not been remarkable for its poetic contributions to literature. Mr. Browning has published "Jocoseria," and Mr. Swinburne "A Century of Roundels." Edwin Arnold has given forth his "Pearls of the Faith" and "Indian Idyls." Mr. J. O. Wright has made a collection of the poems of John Ruskin, Mr. Gosse's work is entitled "On Viol and Flute," Mr. F. W. Myers appeared in "A Renewal of Youth," Mr. George Meredith has published "Poems and Lyrics of the Joy of Earth." Other works deserving of mention are a new collection of Austin Dobson's selected poems, called "Old World Idyls," Mr. Lewis Morris's "Songs Unsung," Justin McCarthy's "Serapion," Mr. Charles Merivale's "The White Pilgrim," and Canon Dixon's "Mano." In Essays and Sketches we have Mr. Froude's "Short Studies on Great Subjects," 4th series, Myers's "Essays," divided into "Classical" and "Modern," in the two volumes issued; Rev. Paxton Hood's "Scottish Characteristics," and Mr. Phil Robinson's pleasant contribution to literary ornithology, "Poets' Birds." Of a more specifically historic character are Mr. Ashton's "Humor, Wit, and Satire of the Seventeenth Century," Mr. Jones's "History of Crowns and Coronations," and Mr. A. G. Hill's "Organs and Organ-Cases of the Middle Ages and the Renaissance."

Fiction.—From the late Anthony Trollope's works left in manuscript there were published last year three: "Land-Leaguers," "Kept in the Dark," and "Mr. Scarborough's Family." Wilkie Collins was heard from in "Heart and Science," Mr. Black published "Yolande" and "Shandon Bells." Mr. Thomas Hardy also produced two new works, viz., "The Strange Adventures of a Milkmaid" and "Two on a Tower." Mr. James Payn published "Kit" and "Thicker than Water"; Mrs. Oliphant, "The Ladies Lindores," "It was a Lover and his Lass," and others; the author of "Molly Bawn" gave us "Rossmoyne" and "Portia"; Mrs. Forrester "June," and Miss Rhoda Broughton "Belinda." Clark Russell published "A Sea Queen," Miss Yonge "Stray Pearls," Miss Macquoid "Her Sailor Love," Walter Besant "All in a Garden Fair," and Robert Buchanan "Love me Forever." From Manville Fenn we had "Eli's Children," from Mrs. Leith Adams "Geoffrey Sterling," from Joseph Hatton "A Modern Ulysses," and from F. W. Robinson "Women are Strange." Mary Cecil Hay has produced "Bid me Discourse," Hawley Smart "At Fault," and Laurence Oliphant "Altiara Peto." Frances Eleanor Trollope has written "Like Ships upon the Sea," and Miss Betham Edwards "Pearla." From Miss Braddon we have had "The Golden Calf" and "Phantom Fortune," from Annie Thomas "Friends and Lovers" and "The Colthorpe Cousins," and from Florence Marryat "Facing the Footlights" and "Peeress and Player." D. Christie Mur-

ray has published "By the Gates of the Sea" and "Hearta."

LITERATURE, CONTINENTAL, IN 1882. The record for the present year is more than usually full and interesting. In some respects activity in literature has been greater than in 1882, although there are no very startling facts to lay before the reader. As heretofore, we give our *résumé* in the alphabetical order of countries.

Belgium.—In religion and morals the most important publication of the year is M. G. d'Alviella's "Contemporary Evolution in Religion among the English, the Americans, and the Hindoos." It has attracted considerable attention, as being no less liberal than learned and exact. Laveye has brought out a new edition of his "Contemporary Socialism," and various other writers have contributed works of value in this department. The study of history continues to be a favorite with the Belgians. Vanderhaegen's "Bibliotheca Belgica" has been completed; and M. Namèche has brought his "Cours d'Histoire Nationale" down to the period of Charles V's reign in the Netherlands. Numerous monographs on local history have also appeared. Since the appointment of a Minister of Public Instruction in Belgium much attention has been given to educational questions, and several volumes have been published this year on the subject. Other subjects have received their fair share of notice—such as political economy, philology, the fine arts, etc. In the domain of the history of letters is M. F. Nève's "Literary Epochs of India," which is regarded as important and valuable. Besides the numerous publications in French, it deserves to be noted that Flemish literature is displaying more power and wider range than usual. Several volumes of poetry also have appeared, and dramatic literature has been very productive. In the death of Hendrik Conscience, Flanders has lost its greatest writer in his special line, and the demonstrations in his honor, at the time of his funeral in Brussels, are said to have been more imposing than any which have yet taken place, even at the burial of kings.

Denmark.—The number of books published in Denmark this year is about the same as in 1882; but there are few works which have appeared that can be regarded as of much importance. Romances and novels are more numerous than lyric poetry and dramas. H. Goldschmidt has produced "Tales and Pictures of Real Life," which are quite equal to his previous contributions. Schandorph, Gjellerup, Elmgaard, Nielsen, and others, have done their share in this kind of literature, though the critics are not enthusiastic over any of their publications. Poetry and the drama offer nothing special for notice. General and political history has been but slightly cultivated, while on the history of literature and art and of allied topics the publications have been numerous. G. Brandy has brought out a capital vol-

ume of criticism entitled "The Romantic School in France," and in his "Men and Works" he has collected a number of valuable essays about modern authors. A new history of Danish literature has been begun by P. Hansen; and several works on the fine arts have appeared. The centenary celebration of the distinguished theologian and writer, Grundtvig, gave rise to a number of publications; as did also the commemorative festival in honor of the fourth centenary of the birthday of Martin Luther. The autobiography of the Danish primate, Martensen, has aroused not only interest but more or less of sharp contradiction and comment. In addition may be named here several good books of travel, a volume or two on philosophy, and a few contributions to popular questions of the day, such as "Liberty," "Education," etc.

France.—Literary activity in the republic has flowed in about the usual channels in 1888. Poetry is of small account this year. Victor Hugo has furnished nothing new, but has given his energies to rendering exact a complete edition of his works. Other writers of verse in France at present hardly deserve special mention. The novel seems to be assuming the normal form of the literature of to-day. Zola and his so-called "naturalistic" school have not produced much this year; but Halévy, Theuriet, Ch. Edmond, F. du Boisgobey (called "the French Wilkie Collins"), and a number of others, have been as active and successful as ever. Literary and philosophical criticism has been almost at a stand-still; but, on the other hand, the publication of documents and hitherto unpublished papers is furnishing large material for work in this department at no distant day. These documents and papers refer to Madame d'Épinay, Madame de Chateaubriand, M. de Rémusat, the "Diplomates of the Revolution," the "Captivity and Death of Louis XVII in the Temple," "Les Rois Frères de Napoléon I," etc. Religious history supplies several publications of merit. Kühn's "Life of Luther" is excellently done; Bersière's "Coligny" deserves much praise, as does also Lagrange's "Life of Mgr. Dupanloup." One of the most curious and peculiarly French publications, more or less of a religious character, are the brilliant skeptic and critic Renan's "Souvenirs of his Childhood and Youth." They are pronounced to be of much value (like the "Confessions" of Rousseau), though marked by a good deal of pretension, egotism, and *naïveté*, and they may be termed a remarkable psychological document. The Roman history of M. V. Druy has reached its sixth volume, and is a work of superior merit in a well-trodden field. Mention also should here be made of MM. Perot and Chipier's "History of Ancient Art"; De Vaux's "Palestine"; the Count de Paris's volumes V and VI of his "History of the American Civil War"; the documents relating to the Spanish Succession, Louis XIV, and William III., etc.

During 1888 great gaps have been made in the ranks of French authors. Jules Sandeau, La-prade, H. Martin (the national historian), François Lenormant, and others of less note, have gone the way of all the earth. Their loss is very great to France, and in measure to all civilized nations.

Germany.—If one may trust statistics, literary activity in Germany during 1888 has been fifteen times as great as in the British Empire. This is probably so, but it can hardly be asserted of the highest and most enduring form of literature. In history we have the venerable Leopold von Ranke's "Weltgeschichte," which gives, in clear impressive outline, the history of the Roman Empire, and depicts, in a manner worthy of its importance, the gradual rise of Christianity and its final fusion with the Roman Empire, from a purely historical point of view. Able critics pronounce this to be far superior to any contemporaneous historical production in Germany or elsewhere. Also, O. H. am Rhyn's great work on the "History of Civilization" has reached its conclusion in a sixth volume; and Hans Prutz, likewise, has dealt freely and with tolerable fullness on the history of the Crusades, and their relationship to art and civilization. Biographical literature has been more than usually rich this year. O. Baisch's life of the German landscape-painter, J. C. Reinhart (1847), is full of interesting matter. Another volume of correspondence between W. von Humboldt's secretary and a lady friend has been issued; Schopenhauer's personal recollections and a portion of his letters have been published; and a life and critical estimate of R. Wagner have made their appearance. Philosophy has little or nothing of moment to show this year. A few volumes on Oriental systems, Hartmann's Pessimism reviewed and examined, Inductive Logic, etc., are all that can be named in this connection. Lyric poetry has been largely and successfully cultivated by numerous writers; and the drama, considerably influenced by Schopenhauer's philosophy, has been enriched by the pessimistic tragedies of Richard Vosz. Most of the dramatists are also writers of novelettes, and they deal with all sorts of subjects and in all sorts of ways. The writers of novels and romances are very numerous, and the country has been flooded with their productions. Paul Heyse stands at the head in his special line. Georg Ebers, Felix Dahn, Alfred Meissner, to say nothing of inferior names, have contributed abundantly to the romance literature of the year. F. Spielhagen, who is ranked as the most eminent novelist of the day, has published his criticisms on works of fiction, and gives it as his opinion that the novel is "the only admissible epic of the present." W. Scherer's "History of German Literature" has reached its conclusion, and is highly praised by the critics on account of its style and fullness of thought. O. Wedingen's work on the same subject is regarded as of inferior merit.

The literature relating to Goethe and Schiller still receives a large share of attention, and it is presumable that Germany will never hear too much about those mighty men of genius.

Holland.—The record of 1883 as to Holland is necessarily brief and not very important. There has been manifested a strong disposition to make large and frequent use of the dialects of the different provinces, in works of travel and narrative, so that every province is said now to have its representative in literature. A number of interesting books about the Dutch East Indies have appeared. Although not much verse has been written this year, some good poems have found their way into the periodicals. The novels of 1883 have been numerous and successful, and several historical novels have shown what Dutch writers are capable of doing in this line. History and philology have received their usual share of attention. De Jonge's "Rise of the Dutch Empire in the East Indies" is being continued by Mr. Van Deventer; and M. Rogge is editing a list of the editions and translations of all Grotius's works, and he is aided by competent scholars in rendering due justice to the great scholar and statesman. Prof. de Vries is slowly continuing the "Woordenboek," and Verdam has published the sixth part of his "Dictionary of Middle-Dutch." The second volume also of Spinoza's "Opera" has made its appearance.

Hungary.—During the year much attention has been bestowed upon collected editions of the great writers of the country, such as John Arany, Antony Osengery, etc. The first volume, too, has appeared of Count Széchenyi's Memoirs, edited by A. Zichy. The great novelist of Hungary, M. Jokai, sustains his reputation in "The Echo of Forty Years." Since the death of Tourguénief, it is asserted that there is no writer in Europe to whom Jokai yields. Dramatic literature has been characterized by much activity and fair production. In history, Hungarian *savants* have been a good deal occupied in collecting and editing original materials, such as the "Codices Diplomatici," "The Archives of the Fugitives," "Hungary and the League of Cambray," etc. A number of excellent works on the recent history of the country have also been published. In science proper, some progress has been made, and in philology and linguistics Hungarian scholars have done their share.

Italy.—One of the most important events in the literary progress of Italy is the creation of a great "Istituto Storico," or Historical Institute. There is excellent promise in such an institution, and it will materially aid the strong national desire to compile an elaborate and definitive history of Italy. Some fifty years ago Cæsare Cantù conceived the idea of a universal history, at which he has been at work ever since, and has been constantly improving and enlarging. It is hoped by his countrymen that he will live to bring it to a

completion. Minghetti, one of the veterans of Italian literature, is still at work, and has published several more volumes on politics and economy. Illustrated works have met with much success, such as the "Illustrazione Italiana," and "La Natura"; and illustrated editions of standard writers have become more and more popular. A. de Gubernatis has established the "Revue Internationale," which is to appear twice a month, and has already made its mark. In brief, there has been, during 1883, a large number of literary, artistic, biographical, economical, and scientific publications; and there is no room to doubt that, with her splendid advantages, Italy will always hold a prominent position in the literature of the world.

Norway.—Notwithstanding the prevalence of considerable political disturbance in Norway for several years, activity in literature has not subsided. It has become perhaps rather too controversial and polemical; but in general it has shown, during 1883, no little point and vigor. The poet Bjørnstjerne Bjørnson took his share in politics, but has, nevertheless, published two dramas which are pronounced by the critics to be of a high order of merit. The usual number of novels has appeared from A. Garborg, Jonas Lie, A. Kielland, and others; but lyric poetry has been very scanty, all comprised in two collections of polemical verses. A contribution to the history of literature has been made by H. Jaeger, in his "Norwegian Authors" (1842-'57); and also a contribution to the history of music, in A. Grönvold's "Norwegian Musicians." There have also been a few publications in science, logic, mental philosophy, church history, and classics; but they are not of special importance in the year's literary progress.

Poland.—The literature of Poland has been to a considerable degree influenced by the fact that 1883 beheld the two-hundredth anniversary of the raising the siege of Vienna. Besides elaborate works, like "John Sobieski and his Age," and "The Campaign of Vienna," numerous monographs, historical, archæological, and military, have been published, relating to Sobieski and his deeds, as well as the famous siege of Vienna; and the anniversary festival gave rise to many poems, lectures, speeches, etc. The "Letters of Sobieski to his Wife" were also brought out in a new edition for popular use. Some efforts have been made in lyric poetry and the drama; but the outcome is not very striking or particularly valuable. The novel-writers have displayed about their usual activity, and have generally sustained their previously earned reputation. Two or three additions have been made to ecclesiastical history and literature; the writings of Supinski, the first of Polish economists, have been published in five volumes; and the valuable correspondence of the poet Krasinski has now been issued in complete form. Also, Estreicher's very full and useful work, "Po-

lish Bibliography," has reached its eighth volume.

Russia.—In the early part of 1888 Tourguénief, the great Russian writer, published his last two contributions to literature, "Poetry in Prose" and "Clara Militch." His death caused wide-spread lamentation, not only in his native land, but everywhere where his genius and wonderful power have been felt and recognized. Among living writers of romance and fiction, Stohedrin and Garshin have produced a number of excellent novels and tales; but besides these there has been hardly anything published which is above mediocrity. In poetry and the drama nothing of moment has been produced; but in the domain of science better results have been attained. Church history has been enriched by the publication of a number of works, especially the twelfth and last volume of the "History of the Russian Church," by the late Metropolitan of Moscow, Makary. The Imperial Russian Historical Society has issued four more volumes of its "Transactions" (vols. 35 to 38), in which is contained a large amount of interesting and valuable matter. History in general has been largely cultivated; and anthropology has been admirably treated in a work by Ziber, entitled "Sketches of Primitive Economic Culture." Social science and legal subjects have been treated of with more than usual fullness this year; and art, archæology, and ethnography have received their full share of attention. Also, numerous books of travel have appeared, and the contributions to geographical science have been of especial value.

Spain.—The number and variety of books printed in Spain this year were unusually large, both original and translated, in the departments of science and letters. F. Picatoste has published a "Popular Dictionary of the Spanish Language," and R. Barcias has completed the fifth and last volume of his "Complete Etymological Dictionary of the Spanish Language." Provincial history has been freely cultivated, as of Leon, Galicia, Navarre, Catalonia, etc. The dialects, too, have excited much attention, such as the Provençal in the east, the Gallego and Bable in the west, and the Basque in the north, and a number of works in relation to these has been published. Light literature, in the way of novels, poetry, humorous works, etc., has considerably improved. Alarcon, Valera, Galdós, Gonzalez, and many others, have been at work, with good success. Additions to the drama have been few, but the lower dramatic art, called *juguetes cómicos*, a sort of composition resembling the French *vaudeville*, has become more in vogue than ever. The Royal Geographical Society has labored diligently, and its fourteenth volume of Transactions has appeared. The text-printing societies in the Peninsula have brought out a number of important works. Among these are Vol. II of "Cancionero General," "El Cultu Sevillano," "Documentos Inéditos para la His-

toria de España," together with photo-lithographic reproductions of books printed in the fifteenth century.

Sweden.—Literary activity in Sweden this year has been steady and fairly productive. An original work on Shakespeare has appeared, which is much praised by the critics; and Tegnér's G. M. Armfelt, "the Northern Alcibiades," the favorite of Gustavus III, is already rated as a standard on this topic. In history, several competent workers have produced good fruit, and illustrated books have attained great popularity. The most prolific and gifted of the younger Swedish poets is Strindberg; he has furnished his countrymen with a collection of lyrics, which are largely satirical and manifest much originality. Dramatic literature, novels, essays, tales, poetical anthologies, and the like, have been quite numerous, and have met with gratifying success. Nordenskiöld has published the second and third volumes of his work, containing the scientific observations made by the Vega expedition. Among scientific productions may be named here Prof. Mittag-Leffler's "Acta Mathematica," and the conclusion of the famous posthumous work of Elias Fries, entitled "Icones Selectæ." To these should be added Ridqvist's great work, "The Laws of the Swedish Language," the first volume of which appeared some thirty years ago; and a collection of the philosophical writings of the eminent Swedish philosopher, J. O. Bostrom. The beautiful heraldic work by Klingspor, entitled "Baltisches Wappenbuch," is completed, and has excited universal admiration.

LOUISIANA. State Government.—The following were the State officers during the year: Governor, Samuel D. McEnery, Democrat; Secretary of State, William A. Strong; Treasurer, E. A. Burke; Auditor, Allen Jumel; Attorney-General, John C. Egan; Adjutant-General, P. G. T. Beauregard; Superintendent of Public Instruction, E. H. Fay; Register of Lands, J. G. Richardson; Commissioner of Agriculture and Immigration, W. H. Harris. Judiciary—Supreme Court: Chief-Justice, Edward Bermudez; Associate Justices, Felix P. Poché, Robert B. Todd, Thomas O. Manning, and Charles E. Fenner.

Legal Decisions.—On the 5th of March, decisions were rendered by the Supreme Court of the United States in several cases affecting the State. The allied cases of the State of New Hampshire and the State of New York against the State of Louisiana were original actions to enforce the payment of consolidated bonds of Louisiana. The Legislatures of the plaintiff States had passed acts permitting their respective Attorney-Generals to bring suit upon such bonds as should be assigned to the State by citizens thereof.

Chief-Justice Waite quotes the eleventh amendment to the Constitution, which provides that the "judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted

against one of the United States by citizens of another State, or by citizens and subjects of any foreign state." He then says:

Under the operation of this amendment the actual owners of the bonds and coupons held by New Hampshire and New York are precluded from prosecuting these suits in their own names. The real question, therefore, is whether they can sue in the name of their respective States after getting the consent of the State; or, to put it in another way, whether a State can allow the use of its name in such suit for the benefit of one of its citizens. The language of the amendment is in effect that the judicial power of the United States shall not extend to any suit commenced or prosecuted by citizens of one State against another State. No one can look at the pleadings and testimony in these cases without being satisfied beyond all doubt that they were in legal effect commenced and are prosecuted solely by the owners of the bonds and coupons. The State and Attorney-General are only nominal actors in the proceeding. The bond-owner, whoever he may be, is the promoter and manager of the suit. He pays the expenses, is the only one authorized to conclude a compromise, and if any money is ever collected it must be paid to him without even passing through the form of getting into the treasury of the State. The State is nothing more nor less than a mere collecting agent of the owners of the bonds and coupons, and, while the suits are in the name of States, they are under the control of individual citizens, and are prosecuted and carried on altogether by and for them.

It is contended, however, that notwithstanding the prohibition of the amendment the States may prosecute the suits because, as "sovereign and trustee of its citizens," a State is clothed with the right and faculty of making an imperative demand upon another independent State for payment of debts which it owes to the citizens of the former." There is no doubt but one nation may, if it see fit, demand of another nation payment of debts owing by the latter to citizens of the former, but States are not nations, either as between themselves or toward foreign nations. They are sovereign within their spheres, but their sovereignty stops short of nationality. Their political status at home and abroad is that of States in the United States.

If the citizens themselves had ample means of redress without the intervention of their Government under the Constitution as it was originally construed, the citizen of one State could sue another State in the courts of the United States for himself, and obtain the same relief that his State could get for him if it should sue. Certainly when he can sue for himself there is no necessity for the power in his State to sue in his behalf, and we can not believe it was intended by the framers of the Constitution to allow both remedies in such a case. Therefore the special remedy granted to the citizen himself must be deemed to have been the only remedy a citizen of one State could have under the Constitution against another State for redress of his grievances, except such as the delinquent State saw fit itself to grant.

In other words, the giving of direct remedy to the citizen himself was equivalent to taking away any indirect remedy he might otherwise have claimed through the intervention of his State, upon any principle of the law of nations. It follows that when the amendment took away the special remedy there was no other left; nothing was added to the Constitution by what was thus done; no power taken away by the grant of special remedy was restored by the amendment. The effect of the amendment was simply to revoke the new right that had been given and leave the limitations to stand as they were. The evident purpose of the amendment was to prohibit all suits against States by or for citizens of other States, or aliens, without the consent of the State to be sued, and in our opinion one State can not create a contro-

versy with another State within the meaning of that term as used in the judicial clauses of the Constitution by assuming the prosecution of debts owing by other States to its citizens. Such being the case, we are satisfied that we are prohibited both by the letter and spirit of the Constitution from entertaining these suits, and the bill in each of them is dismissed.

The two cases of Elliott and others against the Treasurer and Auditor of the State of Louisiana were a suit in equity and one for a *mandamus* to compel the executive officers of the State to comply with the contract between the State and the bondholders, made in 1874—that is, to go on collecting the 5½ mills for the debt fund, which was authorized by the previous Constitution, without any special levy by the Legislature. It also put at issue the validity of the provision of the debt ordinance of 1879, which remitted the January interest of that year on State consols, and turned over the money collected to the general fund.

Among the more important parts of Chief-Justice Waite's opinion are the following:

It is clear that it was the intention of the State of Louisiana to enter into a formal contract with the holders of the bonds issued under the act of 1874, to levy and collect an annual tax of five and a half mills on the dollar of assessed value of all real and personal property in the State, and to apply the revenue derived therefrom to the payment of the principal and interest of the bonds, and to no other purpose. It is equally clear that the object of the State in adopting the debt ordinance in 1879 was to stop the further levy of the promised tax, and to prevent the disbursing officers from using the revenue from previous levies to pay the interest falling due in January, 1880, as well as the principal and interest falling due thereafter. That the Constitution of 1879, on its face, takes away the power of the executive officers to comply with the terms of the act of 1874 can not be denied, as against everything but the outstanding bonds and coupons. This Constitution is the fundamental law of the State, and it is only invalid so far as it impairs the obligation of contracts, on the faith of which the bonds and coupons were taken by their respective holders. The question, then, is whether the contract can be enforced, notwithstanding the Constitution, by coercing the agents and instrumentalities of the State, whose authority has been withdrawn in violation of contract, without having the State itself in its political capacity a party to the proceedings; the relief asked will require the officers against whom the process goes to act contrary to the positive orders of the supreme political power of the State, whose creatures they are, and to which they are ultimately responsible in law for what they do. They must use the public money in the treasury and under their control in one way, when the supreme power has directed them to use it in another, and they must raise more money by taxation, when the same power has declared that it shall not be done.

The remedy sought by the bondholders implies power in the judiciary to compel the State to abide by and perform its contracts for the payment of money, not by rendering and enforcing a judgment in any ordinary form of judicial procedure, but by assuming control of the administration of the fiscal affairs of the State to the extent that may be necessary to accomplish the end in view. In the opinion of this court the judiciary has not this power. It is insisted, however, that the money already in the treasury collected from the tax levied for the year 1879 constitutes a trust fund of which individual defendants are *ex-officio* trustees, and that they may be enjoined as such trustees from diverting it from the purpose to which it was pledged under contract. But the indi-

vidual defendants are the several officers of the State who, under the law, compose the board of liquidation. That board is in no sense the custodian of this fund. The Treasurer of the State is the keeper of the treasure collected from this tax, just as he is the keeper of other public moneys. He holds them, but only as agent of the State, not as a trustee. If there is any trust, the State is trustee, and, unless the State can be sued, the trustees can not be enjoined. The officers owe their duty to the State alone, and have no contract relations with bondholders. There is nothing in the cases cited by counsel which, in the opinion of the court, authorizes the relief which is asked. When a State submits itself without reservation to the jurisdiction of the court in a particular case, that jurisdiction may be used to give full effect to what the State has, by its act of submission, allowed to be done; and if the law permits the coercion of public officers to enforce any judgment that may be rendered, then such coercion may be employed for that purpose, but this is very far from authorizing courts, when the State can not be sued, to set up its jurisdiction over officers in charge of public moneys. The decree in the suit in equity, and judgment in that for mandamus, are affirmed.

Finances.—The State Treasurer had the following cash balances on hand to the credit of the various funds, March 31, 1883:

General fund, 1883	\$30,529 89
General fund, 1882	4,638 81
General fund, 1881	3,109 24
General fund, 1880	3,493 04
General fund, 1879	3,598 12
Current school fund, 1883	62,197 71
Current school fund, 1882	7,708 26
Current school fund, 1881	4,008 82
Current school fund, 1880	2,242 27
Current school fund, 1879	65 87
Charity Hospital, 1881	55,425 15
Interest-tax fund, 1882	93,108 80
Interest-tax fund, 1881	91,497 80
Interest-tax fund, 1880	\$10,149 45
Interest-tax fund, 1879	4,901 73
Interest-tax fund, 1878, and previous	1,659 86
Levee construction and repair, 1878	821 22
Levee construction and repair, 1877, and previous	20 45
Charity-Hospital fund, 1869	66 87
Poll-tax fund, 1879	17,540 06
Levee and drainage fund	14,845 59
Free-school fund	7,198 41
District-levee fund	9,078 56
General-engineer fund	3,111 92
Interest and redemption \$5 bonds	10,877 49
Judicial-expense fund	141 14
Ouachita subsidy	3,875 70
Caddo subsidy	950 00
Militia	800 00
Trust fund	20 00
Repairs of State-House	18,619 68
General account	
Total	\$775,876 76

The Treasurer also made the following statement:

The bonded debt is about \$11,800,000, requiring at 2 per cent. say \$236,000 per year: the Treasurer has paid reduced interest for 1880, \$126,432; for 1881, \$127,054; for 1882, \$112,256—showing that over half the bondholders have accepted the proposal to take 2 per cent. for five years, and 4 per cent. thereafter.

State Lands.—Much controversy has taken place regarding a contract entered into between Gov. Wiltz and John McEnery for the recovery of lands due the State from the United States. It was claimed that "the contract provides that scrip shall be issued to the contractor, which he can place on any land. In other words, when he recovers 1,000 acres of seamarsh, worth say 10 cents an acre, he gets

scrip for 500 acres, which he can place on other land belonging to the State, worth say \$1 per acre. Or if the tract recovered shall be five eighths swamp and three eighths good land, he may take the latter and leave the State the least valuable portion, and have besides a little surplus scrip to put somewhere else."

It was also claimed that under the terms of the contract the State had been defrauded with the connivance of Register Richardson, who resigned on the 30th of June. Gov. McEnery, when attacked on account of this contract, replied that it was in full force when he came into office, and he had no power to annul it.

Levees.—The drainage from over 1,200,000 square miles of the Mississippi valley, concentrated above Louisiana's northern boundary, can only be kept within the banks of the Mississippi by a line of levees extending from Arkansas on one side and from Baton Rouge on the other, to the Gulf of Mexico, 720 miles. Add to this the 805 miles of levees built along the interior streams—the Lafourche, Atchafalaya, Des Glaizes, Black, Tensas, and Roundaway—and we have a total of 1,025 miles.

From Jan. 1, 1879, to May 31, 1883, the State expended for levees \$1,617,311, out of a total of cash expenditures for all purposes of \$8,876,872—over 18 per cent. From 1869 to 1879 the cash expenditures for levee purposes amounted to \$8,733,121. Since 1869, then, Louisiana has spent for levees \$10,350,432.

A Levee Convention, consisting of representatives from thirty-four parishes and several railroads, was held at Baton Rouge on the 18th and 19th of June. The Governor submitted a message containing various recommendations. The action of the convention was embodied in the report of a committee on the Governor's message and in resolutions. The following are the essential portions of the report:

1. The inauguration of a plan to prevent the cutting of the levees, and the use of them as highways. Under existing laws, the local authorities are not invested with sufficient power to prevent the use of the levees as roadways, and to impose proper penalties. We would therefore recommend the passage of laws giving to the police juries full and ample power to pass laws and ordinances defining and providing adequate punishment for such offenses.

2. Maintaining and repair of levees. We would recommend the passage of an act to compel work upon the levees by the adult citizens living in the levee district, such work to be under the control and direction of the police juries. We further recommend that the police juries be urged to exercise the important powers intrusted to them by existing laws for the maintenance and protection of levees, and especially to the use of the levees as roads or their cutting for roadways or rice-flumes. We approve the suggestion of the Governor in reference to the just responsibility of railroads to contribute to the maintenance and support of the levees which protect their property.

We recommend the formation of chartered volunteer companies of levee guards in towns and cities; the erection of station or signal houses at convenient points by the people of the vicinity. The said station-houses to be used as depots for materials and appliances to stop crevassees or to strengthen weak points.

3. Improvement of navigation. The convention has by independent resolutions fully indorsed the

sentiments expressed by the Governor in reference to the Mississippi River Commission. The committee heartily recommends the suggestion of the Governor in reference to the appointment of an executive committee of ten so organized as to be readily assembled, the duty of the committee to be to act in concert with other bodies of a like character and to be ready with all necessary information to go before Congress at its next and ensuing sessions in behalf of the interests of the people of this State.

Among the resolutions were the following :

That we earnestly appeal to his Excellency the Governor of Louisiana to immediately adopt such means and measures as may be necessary to place the entire convict force at work on the levees of the State.

That the chairman of this convention appoint a committee of ten delegates to confer with the representatives of the Mississippi Valley, Texas and Pacific and Morgan railroads, to receive any proposition tending toward their assisting in the matter of keeping a general system of levees in conjunction with the State.

That concerning the Red and Atchafalaya rivers, we deem inexpedient and hurtful to the commercial interests of the people of the Red river country and those of the tributaries, any attempt to divert the course of that river away from the Mississippi, and that the waters of the Red should be deflected from the Atchafalaya.

Democratic Convention.—When the question of candidates to be voted for at the election in April, 1884, came to be discussed, much opposition to the renomination of Gov. McEnery, led by the New Orleans "Picayune," manifested itself within the Democratic ranks. The primaries were attended with much excitement, and in some instances with violence. The convention met in Baton Rouge on the 18th of December; a prolonged struggle over contested seats ensued, and an adjournment was not reached till midnight of the 20th. Gov. McEnery was renominated by a vote of 220½, to 178½ for Francis T. Nicholls. An attempt to make the nomination unanimous failed. The ticket was completed as follows:

Lieutenant-Governor, Clay Knobloch, of Lafourche; Treasurer, E. A. Burke, of Orleans; Attorney-General, M. J. Cunningham, of Natchitoches; Secretary of State, Oscar Arroyo, of Plaquemines; Auditor, O. B. Steele, of Union; Superintendent of Education, Warren Easton, of Orleans.

"With the exception of the gentleman nominated for the attorney-generalship," says the "Picayune," "all the nominees are of the McEnery faction, and the ticket as a whole gives no promise of that reform in the management of the party and the administration of the State of which both are so much in need."

Among the resolutions adopted by the convention were the following :

That we declare our hostility to the entire principle of lottery dealings. The Constitution declares gambling to be a vice, yet it encourages that vice in its worst form, not only inciting to breaches of faith and embezzlement in the effort to get rich on the turn of the wheel, but demoralizing society, corrupting politics, and impeding legislation; and we demand that the Legislature be chosen at the ensuing election shall enact such legal measures as are necessary for their suppression.

That the convict-labor of the State should be appropriated and assigned to labor on the public levees, under the direction and control of the State authorities, by such legislation as may be necessary.

Sugar and Rice.—The year 1882-'83 witnessed the heaviest production of sugar ever made in Louisiana since the war.

There were 120,555 acres of cane crushed, or 25,528 acres more than the previous year, and the average yield per acre was 2,782 pounds where the vacuum-pan was used, or 2,368 pounds where open kettles or the ordinary steam-train were used. The first arrival of sugar comprised 20 barrels white clarified from the Forlorn Hope Plantation, parish of Iberville, and came in October 7th.

The crop amounted to 808,066,258 pounds of sugar, equivalent to 241,220 hogsheads. The production of open-kettle or old-process sugars amounted to 184,860,890 pounds, or 150,292 hogsheads. The production of clarified or centrifugal sugars amounted to 118,205,868 pounds, or 90,927 hogsheads.

The total product of molasses for the season amounted to 15,716,755 gallons, of which 4,255,411 gallons represented centrifugals and 11,461,344 gallons were open-kettle or old-process molasses. During the year 1881-'82 the production amounted to 9,691,104 gallons, of which 2,926,186 gallons were centrifugals and 6,764,918 gallons were open-kettle molasses.

The production of rice in Louisiana for the season of 1882 amounted to 187,217 barrels of clean rice. The crop the previous year amounted to 55,422,180 pounds, or 240,966 barrels of clean rice. The crop for the season of 1880 amounted to 61,831,840 pounds, or 266,658 barrels of clean rice.

New Orleans.—The domestic exports from the port of New Orleans to foreign countries during the fiscal year (Sept. 1st to Aug. 31st) 1882-'83, compared with former years, were:

Total exports, 1882-'83	\$95,290,968
" 1881-'82	63,190,481
" 1880-'81	104,150,450
" 1879-'80	93,395,890
" 1878-'79	63,624,797
" 1877-'78	84,581,794
" 1876-'77	70,197,733
" 1875-'76	69,594,190
" 1874-'75	71,462,967

Of the exports in 1882-'83, \$79,665,176 represented cotton, \$7,455,961 wheat, and \$4,866,675 corn.

The imports of foreign products and manufactures into the port of New Orleans during the fiscal year 1882-'83, compared with former years, were:

Total imports, 1882-'83	\$9,414,015
" 1881-'82	11,968,852
" 1880-'81	12,418,570
" 1879-'80	10,915,043
" 1878-'79	7,141,959
" 1877-'78	11,458,143
" 1876-'77	9,562,550
" 1875-'76	11,602,578
" 1874-'75	12,354,469

The custom-house figures for the years 1882-'83 and 1881-'82 exhibit the following :

	Number of venues.	Tonnage.
This year, entered.....	1,152	1,062,880
" cleared.....	1,158	1,064,267
Last year, entered.....	897	968,079
" cleared.....	958	1,088,869

LOUVAIN, THE REFORMATORY PRISON AT.

Louvain is a city of Belgium, fifteen miles northeast of Brussels. The management of its reformatory prison is based on the principle that even in the most corrupt man there is a germ of good sentiments and feeling, the development of which can be secured by making the prison a place of repentance and amendment. The first condition required for this end is the separation of the prisoner from bad counsels and bad examples. This introduces the cell system. But in the erection of the building at Louvain the results of experience were kept in view. It was believed that the numerous cases of madness and suicide in cell-prisons were not caused by the system of separate confinement in itself, but by the bad application of it. Thus, on adopting the form of a star in the construction of the building (an arrangement found most convenient for watchfulness), it was determined to change entirely the material and moral treatment of the prisoners. The cells are airy and well lighted. Water is brought to them in abundance by a pipe with a stop, which is opened at pleasure within, but which is controlled by a key on the exterior. There is a similar arrangement for the gas-jet, and by a special contrivance it can be made to furnish the heat required for the prisoner's trade. A wash-stand, water-closet hermetically closed, several book-shelves, a table, a chair, and a folding-bed, compose the furniture. There are also the tools or machines necessary for the prisoner to prosecute some work. Here are seen tailors, shoemakers, saddlers, bookbinders, carpenters, locksmiths, etc. Some of the prisoners are bakers; others scullions, or head cooks. The cookery of the latter is not very nutritious, but it is not unwholesome. The bread is better than that of the French; in the other articles of food there is no comparison. In the French prisons, the inmates receive during the week only soup, and on Sunday a little meat, while at Louvain they have bread in the morning, soup at noon, vegetables at night, and meat twice a week.

The prisoners have also the liberty to buy "knick-knacks" with a little of the money which they earn; the rest is kept for them until the expiration of their sentences. These sums are comparatively large; for in this prison most of the clothing and equipments of the Belgian army are made, and the Government pays as good wages as to the free workmen.

When any kinds of work were to be done which required the labor of many persons together, it was found very troublesome to maintain the rule of separation. At first it was decided never to suffer two convicts to labor

together, except under the special watch of a guard who should prevent any communication between them. But this proved insufficient. The problem was solved under the principle upon which the establishment was founded. It was indispensable to protect the convict, on his going out of prison, against disagreeable recognition by his old fellow-prisoners. It has been said that the first requisite for the encouragement of a repentant criminal to persevere in his reformed life, was to prevent his disgrace from being cast upon him, if possible. Thus, upon the arrival of the convict at the prison, he is taken to the director, to whom he tells, in confidence, his name; in exchange he receives a number, by which only he is henceforth known. He then goes to the dressing-room, and after undergoing the changes required by the rules, he puts on a large bonnet which conceals his features, and has only the two openings for the eyes. He never goes from his cell, or receives any person there, without concealing his countenance in this manner. Thus he continues, or believes that he continues, entirely unknown.

One very forcible objection to the cell system is the mute state in which the convicts are kept. Absolute silence is a very severe chastisement; it often causes madness, and, in any case, it is not in itself an agent of improvement. That danger has been avoided at Louvain. If the convicts can not converse among themselves, they are in constant connection with their guards and with the overseers, who come and go continually. Besides, they are visited every day by the director or his assistant, or the distributors of food, the clergy, or rabbi. Twice a week, and sometimes oftener, they have a long visit from the teacher. All the prisoners are obliged to go to school. There is an amphitheatre where the pupils can see the professor, but can not see one another. They are really separated by a door, which each one closes as he reaches his place. Lest they might be recognized by the voice, all questions are forbidden during the lesson; but the instructor afterward goes to each cell to assure himself that his explanations have been understood. Thus, in a novel manner, the monotony of the imprisonment is broken.

Again, the kind of labor imposed on the convicts is their safeguard against hypochondria. In other prisons labor is repulsive, as nearly all is done by machinery. At Louvain the labors require a certain mental application, and therein the convicts find a real relief. This organization also enables a convict to fit himself to obtain a livelihood if he came to the prison without having learned a trade; or to make a change if he does not wish afterward to resume his old trade. The results of this system are excellent, if we can believe the statistics of the first twenty years that the prison has been in operation. The cases of suicide or madness are not more numerous, for the population, than in the cities of Belgium, though

the convicts have a thousand means by which to take life. The awls, paring-knives, scissors, and leather straps, abound in the cells.

So far as relates to subsequent or second committals, while in France they count as high as forty-one to forty-eight per cent., at Louvain they scarcely exceed six per cent. The reason of this difference seems to exist not only in the system itself, the administration of which is very intelligent, but also, and especially, in the chosen officers. The lowest guards obtain their places by competition. But this does not satisfy the director, who has them continually under his eye; he desires that they should regard their employment as a mission to which they should wholly devote themselves.

"At the time of our first visit to Louvain," says the journal "La France," "we came strongly prejudiced against the single-cell system generally, so that it was not without surprise that we observed the calm air of the prisoners. They seemed to have even a kind of attachment for their sad home. Here one sees wreaths of ornamented paper all around the cell; in others, the spaces for the vessels were covered with odd ornaments, which revealed a certain taste in the unfortunate ones who had arranged them; in some there were natural flowers in a pot on the work-bench. These flowers had been gathered by the convict in the yard, where he daily made a promenade. These yards do not resemble the dungeons where French prisoners turn back and forth like imprisoned deer. They are oblong little gardens, inclosed on the sides by the high walls and terminating at the ends by gratings, one of which facilitates the watch of the guards placed at a central point, and the other presents the vast kitchen-gardens of the prison. The product of the little gardens goes to some of the convicts, who can cultivate a corner as they please during their recreation, and eat the fruit and gather the flowers. We were no less astonished to see bouquets in the penitentiary-cells, and on entering the office of the director, M. J. J. Paul, an accomplished man, we could not refrain from saying to him, 'Sweet prison, sir, where the convicts are permitted to make the air which they breathe fragrant with the perfume of flowers.' 'I know it is an infraction of the regulations,' he replied, 'but I have given an order to the guards not to remove them. When a criminal begins to decorate his cell, by attaching himself to flowers, he has become less obdurate. If one of them finds in his yard a bird fallen from a nest, which he desires to keep in his cell, I close my eyes again and rejoice, for that man will become better.'"

LUTHER QUADRICENTENNIAL. Saturday, Nov. 10, 1883, was the four-hundredth anniversary of the birthday of Martin Luther. There were many reasons why the occasion should be celebrated. That religious and social movement which he originated is one of the few great dividing-points in the history of

civilization. The preceding four centuries belong distinctively to mediæval history; the four centuries which have since elapsed belong as distinctively to modern history. More than half of Christendom holds that this religious movement has been a great and almost unmixed evil; less than half hold that it has been a great and almost unmixed good. But there are few men in our day who do not hold that the social and political reforms which sprang out of and have accompanied this movement have been of the highest benefit. It would not be easy to find a Roman Catholic who would wish civil governments to be restored to the state in which they were at the close of the fifteenth century. Few would, even in theory, hold that the Church should be re-established as it was in the times of Alexander VI, Julius II, and Leo X. Indeed, the reformation which went on within the Church was hardly less notable than that which went on from it in the lifetime of Luther, and for a generation thereafter; and that reformation within the Church can be traced, mediately or immediately, to the revolt which Luther headed against the Church.

It is easy to affirm that if there had been no Martin Luther there would have been some other man or men who would have done all that he did, and better than he did it. Nothing is easier than to speculate upon what might have been. But there was a Martin Luther, by whom, through whom, and often in spite of whom, certain great things were brought about. Luther's countrymen, and not a few others, hold that these things were among the most notable recorded in human history.

Luther's life was a warfare. His weapons were thoughts and words, which in the long run have ever proved themselves mightier than armies and armaments. One of the most thoughtful of American authors, writing of "Luther and his Place in History," says: "He spoke for all future ages. His words saved Germany, and created Modern History. The Gothic and German races rose to rare prosperity at the touch of Luther's genius; the Latin races rejected his teachings, and have for three centuries slumbered in dull reaction and decay. He died at the age of sixty-three, the master intellect of the Teutonic race."

The countrymen of Luther have never been unmindful of their debt to this peasant's son. He gave them a common language, the first requisite to a national unity, lying even deeper than mere unity of race. Not that, as some have said, he created the modern German language. To create a language is what no one man, no cycle of men, has ever done. But in adopting in his writings, and especially in his translation of the Bible, the Franconian dialect, remote on the one hand from what was known as the High Dutch, and on the other from the Low Dutch, yet still intelligible to all, he fixed the forms of that dialect as the language for the people. His guiding purpose was, so to

write that his words should be understood "by the mother in the house, the children in the streets, and the common man in the markets." The translation of the New Testament was almost wholly his own work. Some of the manuscripts of this translation are still extant, and they evince the labor which the work cost him. There are passages which have been corrected and recorrected half a score of times before the exact form was at last attained; but now it seems strange that any other words or collocation of words should have been thought of. In the translation of the Old Testament Luther needed much assistance, for, besides a few rabbis, there was not in all Europe a tolerable Hebrew scholar. So much aid did he receive from these rabbis, that the company of translators was jestingly called "the private Sanhedrim." But, even in this part of the undertaking, the real work of translation was Luther's. His co-laborers might enable him to understand what the Hebrew writers had said in their own language, but Luther alone was competent to make them say it in German. He himself tells what a task it was: "We are working hard," he writes to a friend, "to bring out the prophets in our mother-tongue. Ach Gott! what a great and difficult work it is to make the Hebrew writers speak German!" But he did make them do it, so far at least as he understood them; and his intense sympathy with them went far to enable him to penetrate the very soul of their Oriental thought and phraseology.

So adequate for all purposes has Luther's translation proved, that it is not until our own immediate day that any serious attempt at even a revision has been made. A German revised translation has just been completed, and the first printed copy of it was presented to the Emperor of Germany on the day of this Lutheran quadricentennial.

Very much of Luther's abundant literary work was for the time merely. He occupied, in a measure, the place now filled by the editor. Newspapers and regular periodicals did not then exist; but Luther's pamphlets and broad-sheets partially supplied their place. In one year he put forth nearly two hundred of these treatises, all dealing with current matters, which to him and to others seemed of vital import. All of them have been reprinted again and again. His "Table-Talk," jotted down mainly from memory by one and another of his disciples, is among the most readable of books to this day. He lacked little of being a great poet. He was all his life too busy to be able to spend much time in fitting rhymes and scanning syllables; yet some of his hymns are immortal. The "Ein' feste Burg ist unser Gott" is not merely a psalm of worship, but has been also the national battle-hymn, the German anthem of hope and encouragement, from Luther's day to our own; and wherever this Luther commemoration was solemnized, this hymn formed the fitting prelude.

The great secret of the strength of Luther is, that he was German to the very core of his being. He, as it were, created the German nation, because he was himself a German of the Germans. Julius Köstlein, the latest, and by far the best, biographer of Luther, fairly sums up the national estimate of the man, which is in the main that of the great body of the Protestant world. Köstlein's "Life of Luther" appeared in German ten years ago; an English translation of it was brought out at the time of this commemoration. Köstlein says: "No German has ever influenced so powerfully as Luther the religious life, and, through it, the whole history of his people. No other one has ever, in his whole personal character and conduct, so faithfully reflected the peculiar features of that life and history, and has been enabled by that very means to render us a service so effectual and popular. If we recall to fresh life and remembrance the great men of past ages, we Germans shall always put Luther in the van."

In Germany.—There were in Germany some reasons why this four-hundredth anniversary of Lutheranism—which is but another expression for Germanism—should have a special significance. The consolidation of the disjointed German states into a nation, which had been one of the dreams of Luther's life, had within less than half a generation come to be an established fact, after centuries of unavailing effort. To give a tangible evidence of this great fact, a colossal statue of Germania had been planned, to be placed opposite Bingen on the Rhine. This statue, thirty-three feet high, stands upon a lofty pedestal, erected upon a bold bluff, looking down upon and seeming to keep watch over a long stretch of that historic stream, now for the first time wholly German. It was just ready for unveiling in the autumn of this year. The inscription on its base reads, "In memory of the unanimous and victorious uprising of the German nation, and the restoration of the German Empire, 1870-1871." Herr Stocker, the court preacher at Berlin, speaking to an English audience upon commemoration-day, emphasized the vital connection between Luther and this "victorious uprising." "Prussia," he said, "like other countries, owes its growth to the Lutheran Reformation; and when the Crown Prince of Germany laid a wreath upon Luther's grave at Wittenberg, he well knew what he was doing. He gave public recognition to the truth that the new German Empire had its rise in the Protestant spirit."

The precise mode of the celebration in Germany developed itself but slowly. If any special day was to be chosen, one would imagine that the anniversary of Luther's birth would at once have suggested itself. But for some reason the authorities of Wittenberg—the place of all others most intimately associated with the public life of the reformer—chose to hold their celebration two months earlier, on Sept.

12th. The Crown Prince had been deputed by his father, the aged Emperor, to represent him on this occasion, and 50,000 persons were assembled as spectators of the ceremonies. "Unser Fritz" performed his part with decorous zeal. At the appointed time he went in state to the Castle church, and placed a magnificent laurel-wreath upon the grave of Luther. In the mean while a long procession had been moving toward a large hall—the same in which Luther had delivered those lectures which made the university famous in his day. This was now reconsecrated as Luther Hall; the Crown Prince saying at the close of the proceedings: "May this festival serve as a holy exhortation to us to uphold the great benefits of the Reformation, and to strengthen our resolution to be ever ready to defend the Evangelical creed, liberty of conscience, and religious toleration! May Luther's anniversary help to confirm us in the resolve to enliven the Protestant feeling, preserve the German Evangelical Church from disunion, and lay the foundations of an everlasting peace!"

Germany is not all Protestant, and the Catholics could not be expected to look with favor upon a commemoration like this, which it was now evident would assume a national character. The Wittenberg celebration was hardly over when it was proposed that the Catholics should observe the month of October as a "month of prayer." It was especially urged that the Catholic children throughout Germany should "join together in fervent supplications to Heaven for a speedy reunion of all Christian peoples within the fold of the one true Church." This recommendation was carried out to a very considerable extent, though it could hardly call forth much enthusiasm.

The preliminary celebration at Wittenberg was essentially the imperial one; that at Berlin was rather municipal and civic, though the Emperor and the royal family bore some part in it. On Friday the capital began to put on a festal aspect. Flag-staffs were raised on the roofs, and decorations pervaded the streets and public buildings. A somewhat cynical correspondent does not fail to notice that "the shopkeepers, great and small, appear to combine gratitude to the great reformer with an effort to turn an honest penny, by exhibiting his portrait in their windows for sale." As evening fell, the bells of the churches sounded their loudest peals, and on Saturday, at half-past seven in the morning, they rang out again. The pupils of all the public schools marched in long procession to attend divine worship; and as the churches were insufficient to contain them, services were also held in public halls. The grand procession moved early from the town hall toward the church of St. Nicholas, the oldest place of worship in Berlin. The procession was much like those with which we are familiar, wanting, however, the military element. In front moved heralds and musicians. Then followed the Protestant clergy, the pro-

fessors and students of the university, the chief officials of the city, of the kingdom of Prussia, and the empire. Last came the minor officials and common citizens. By noon the church was crowded. After a pause of half an hour, the Emperor, the Crown Prince, and the princes William and Frederick Charles made their appearance. Then the liturgy was recited, drums were beaten, trumpets blown, and Luther's "Ein feste Burg" pealed forth like a song of victory to the roar of the great organ. General-Superintendent Brückner delivered the sermon of the day. It was a long and not over-brilliant discourse, the leading theme being that "Luther's grandest work, and most precious legacy to the world, was the purification of the Christian faith."

The celebration at Eisleben was by far the most characteristic one which we find described. In this mining town Luther was born, and here he died. His connection with Eisleben was in both respects altogether accidental. His parents resided in the neighboring village of Mansfeld. His mother had gone to Eisleben in order to make some household purchases, when he was born. Not long afterward his father took up his residence at Eisleben, and here Luther's boyhood was passed. He himself supposed that he was born at Mansfeld. He was sent to school at Mansfeld at the age of twelve, and it does not appear that he was ever after that in his native town for more than a few days, until a month before his death. He went there, not from any longings to revisit the home of his childhood, but for the purpose of bringing about a reconciliation between the two Counts of Mansfeld, who were at feud. The weather was inclement, and he was seized with a severe cold, which resulted in pneumonia. He was not thought to be in special danger until the day before his death. Only four days previous he had delivered his last sermon.

Eisleben possesses few memorials of Luther. The house in which he was born is still standing in the street that bears his name, though somewhat changed. It was partially burned in 1594, but was restored at the expense of the town, and was again restored in 1817; but the interior of the lower part remains unaltered. The entrance is modern, and over the door is a bust of Luther, and this inscription: "In this house Dr. Martin Luther was born, 10th of November, 1483.—God's word is Luther's lore; therefore fails it never more." The house in which he died is also standing, near the market-place. On the front is a small tablet which simply says, "In this house Dr. Martin Luther died, the 18th of February, 1546." The humble house in which he was born is uninhabited and unfurnished, except for a few relics of Luther, which are of doubtful authenticity. In the more pretentious dwelling in which he died, the guest of the town-clerk, Luther's death-chamber and the sitting-room are unoccupied and unfurnished.

Nowhere in Germany has the memory of Luther taken stronger hold than in this mining region of Saxony. People of all orders and degrees set themselves to celebrate this four-hundredth anniversary, and 30,000 visitors swarmed into the little town. The great 'when he publicly burned the papal bull before the Elster gate of Wittenberg. Clad in his academical robes, he stands erect, his left hand holding the Bible closely pressed to his heart. In the right hand the bull is held aloft, to be flung into the flames. This tells the story of

LUTHER'S STATUE IN EISELEBEN.

event of the day was the unveiling of a statue of Luther in the market-place. It is of bronze, nine feet high, standing upon a low granite plinth. The figure represents the reformer as he was at what may be esteemed the crisis of his career, that 10th day of December, 1520,

the Reformation as conceived by Luther: God's word against the decrees of the Pope.

The dawn of the bright November day was ushered in by peals of church-bells. In good time the magistrates walked in procession to the church of St. Andrew, where Luther had

delivered his last sermon from the antique pulpit, now garlanded with evergreens. The hal-lalujah chorus was sung, and then Chaplain Frommel, from Berlin, delivered the sermon. As the clocks struck twelve, the ceremony of unveiling the statue began. "Ein' feste Burg" was sung; and then the worthy Burgomaster Martin gave an account of the memorial statue. All heads were then bared as the covering was removed, while the choir struck up that other noble hymn of Luther's, "Praise ye the Lord, the mighty King." Dr. Koegel, the Emperor's chaplain, pronounced the inaugural oration, formally presented the statue to the town, and dismissed the auditory with the benediction. In the afternoon an official dinner was given.

But these official ceremonials were not the most interesting part of the Eisleben celebration. The people of the region arranged an addition to the programme. When Luther came thither, an imposing reception had been given to him. It was resolved to revive this upon a far larger scale by an historical procession. First came the mounted heralds, trumpeters, and banner-bearers of the counts of Mansfeld, followed by knights and squires, huntsmen and falconers, lords and ladies, all clad in the picturesque costume of four hundred years ago, distributed into various groups, as the scene has been handed down by the old chroniclers. Then came those representing the civic authorities of the good town; then Luther himself, seated in the gorgeous chariot of the count, his three young sons, and his friend Justus Jonas, by his side. After them were the citizens of Eisleben and the surrounding region. Everybody had done his best to present himself as his forefathers might have looked. There were merchants in long coats of red velvet; gardeners in light green; all schools and guilds with the various emblems of their crafts; feudal retainers with crossbows and javelins—all mingling together in gay confusion. One might have thought a bit of the fifteenth century had suddenly dropped into the closing years of the nineteenth.

In Denmark and Sweden.—In Denmark and Sweden the day was universally celebrated as a high festival. The schools were closed, public business was suspended, and meetings were held in the churches, where the great deeds of Luther were set forth.

In France.—In France the Protestants form an inconsiderable part of the community, and of these the Lutherans are an insignificant fraction. French Protestantism has always had little sympathy with Luther, looking rather to Calvin as its founder; and just now anything German is not in the best esteem in France. Nevertheless, the adherents of the "reformed" and those of the "free" church could not be unmindful of the occasion. In Paris, at least one crowded meeting was held, and the great German was warmly eulogized. Pastor Walbaum extolled his activity, joyousness, sensibility, and heroism, declaring that, in spite of

some short-comings, "he had been equaled by no man since Paul." M. Recollin went so far as to admit that, great as Calvin was, "Luther was far more expansive and universal." M. de Pressensé, speaking for the "Free Church," eulogized Luther as the "ideal representative of the German race in its best features, and at its finest period; he was the great emancipator of souls." He also took occasion to repel the invectives which the Catholic press had recently been heaping upon Luther.

There had been no lack of such attacks, the foremost assailant being the "Univers," the recognized organ of the Clerical party. This periodical averred that "Germany is really celebrating her own debasement by the man who was the direct or indirect author of massacres so numerous that, could the bones of those who had lost their lives through the influence of his pernicious teachings be exhumed, they would whiten the whole soil of Germany. He was a denier of free-will, and of the value of good works. He died in consequence of a gross debauch; and Heaven itself had visibly interposed to brand his memory with infamy; the tree under which he took shelter on his flight from Worms had been blasted by lightning, and a thunder-bolt had twice struck the church in which he was buried. In another life he has the destiny which he prepared for himself, for, according to his own confession, he had while on earth too much dealing with the devil to deserve to escape eternal damnation," and much more of the like import. The "Univers" also gives place to a paper by Bishop Freppel, who used to lecture upon Luther at the Sorbonne. He was "amazed at the glorification, at this day, of the man who denied free-will, declared good works prejudicial to salvation, set all nations at variance, and was the very incarnation of intolerance"; and declared that it was a "huge joke on the part of the Crown Prince of Germany to designate this coming Lutheran commemoration as the festival of toleration."

In England.—In England the day was very widely celebrated, large meetings being held in every considerable town and city. The higher ranks of the Anglican clergy took little part in the movement; the notable exceptions being the Archbishop of York, the Bishop of Liverpool, and Canon Farrar. The archbishop, in the hierarchy, stands second to the Archbishop of Canterbury, and consequently second, after the royal family, in order of precedence, outranking all dukes, earls, and barons. He had some weeks before accepted an invitation to deliver a sermon upon Luther on this commemoration-day. The Dean of York ranks next to him in the archdiocese, being in special charge of the ordinary services of York Minster, the cathedral church. He took alarm at this intimation of the archbishop, and wrote to the newspapers to the effect that Luther was a foreigner, and not of the Anglican communion, and so not to be, as it were, canonized,

and added that any formal church service in which the Lutheran movement should be publicly commemorated "would gender strife, encourage discord, and hinder individual spiritual life." If such an encomium were to be pronounced by the archbishop in the minster, he himself would be absent from the service. The archbishop purposed to deliver the sermon, not in the cathedral, but in another church in the city. He, however, took prompt occasion to affirm his right to deliver it in the minster, and at the same time to set forth his own position in the matter. To the "Times" he wrote: "Every time we use the church service, and particularly the holy communion service in our churches, we affirm the Reformation. Every candidate who is ordained, and every clergyman who receives a benefice does, by signing the Thirty-nine Articles afresh, which attest the Reformation. Every year, when the convocation meets within the precincts of the minster, we return thanks, in the convocation prayer, for the blessings of the Reformation, and for our deliverance from the papal tyranny which once here prevailed. While it is true that the English Reformation was accomplished in a different manner from the Reformation in Germany and other countries, yet it is nevertheless true that the possibility of a religious reformation in any part of Europe sprang in a large part from the intense personal conviction and contagious faith of one man—Martin Luther."

This York discourse, delivered on Saturday, was repeated on Sunday, Nov. 11th, in Westminster Abbey. It embodied a eulogistic statement of the great facts in Luther's career, closing with a summation of the reasons why he should be held in special reverence by the Church of England. "The Anglican Church," said the archbishop, "bears a much nearer resemblance to the German Reformed than to the Protestant system which prevailed in Switzerland. Our Church joined with Luther in protesting against the Zwinglian doctrine of the eucharist; and, out of the Thirty-nine Articles, not less than fourteen were derived from the Confessions of Augsburg and Württemberg. It has, moreover, been conclusively shown that in countries where the Reformed religion prevailed, there was more order, more liberty, greater prosperity, greater industry and enterprise, than existed in countries which professed the Roman Catholic religion. This was not the result of race, but was equally evident when comparison was made between populations of the same race professing the two different religions. How great, therefore, is the debt we owe to the great reformer whose teachings had brought about such results! This was certainly a memory which Englishmen would never let die."

What may be styled the popular movement in England was headed by the Earl of Shaftesbury, the chairman of the Lutheran Commemoration Committee. Among the immense meet-

ings held was one at Exeter Hall, where clerical and lay orators spoke in the same strain with those from whom citations have been made.

In America.—In the United States the commemoration was widely observed, though without any ostentatious public display. On Sunday, Nov. 11th, the day following the anniversary of Luther's birth, there were few prominent Protestant pulpits in which the work of the great German was not made the theme of comment and eulogy. Large meetings were held in New York, Philadelphia, Boston, Brooklyn, Baltimore, Chicago, Pittsburg, Princeton, and other places. In Cincinnati, Monsignor O'Connell delivered two discourses in the cathedral, in which he treated of Luther from the Catholic stand-point.

LUTHERANS. Considerable discrepancies exist between the computations of the statistics of the several Lutheran bodies in the United States as given in the different year-books.

The "Church Almanac" (General Council) gives summaries as follows:

	Ministers.	Congregations.	Members.
General Council, ten synods.....	654	1,819	216,987
Synodical Conference, six synods	1,148	1,880	288,497
General Synod, South, six synods	180	289	19,680
General Synod, North, twenty-three synods.....	840	1,877	198,927
Eleven independent synods.....	554	1,457	148,523
Total.....	3,851	6,265	797,548

Brobst's "Lutherische Kalender," also representing the General Council, gives:

	Ministers.	Congregations.	Members.
General Council, ten synods.....	660	1,829	211,509
Synodical Conference, five synods	965	1,878	287,817
General Synod, South, six synods	165	241	17,774
General Synod, North, twenty-three synods.....	855	1,486	199,204
Independent synods.....	718	1,697	197,164
German Synod of Iowa.....	178	290	95,000
Norwegian Augustana Synod....	21	56	8,500
Total.....	3,589	6,423	821,968

The German Synod of Iowa and the Norwegian Augustana Synod, classed in the "Church Almanac" among the independent synods, are regarded in the Brobst "Kalender" as affiliated in sympathy with the General Council, though not officially connected with it. If their members were added to those of the General Council, the strength of that body would be, according to Brobst, 879 ministers, 1,875 congregations, and 240,009 members. The sum of the members shows, according to Brobst, an increase during the year in the entire Lutheran Church of 153 pastors, 292 congregations, and 86,181 communicants.

Of educational institutions connected with the several bodies and particular synods, the "Church Almanac" enumerates 19 theological seminaries, 18 colleges and universities, 29 academies, and 16 seminaries for young women. The charitable and benevolent institu-

tions comprise 25 orphanages, 8 hospitals, 1 home for the aged and infirm, 1 institute for the deaf and dumb, 4 emigrant missions, under the care of different bodies, in New York city, and 1 emigrant mission in Baltimore. The whole number of periodicals is 87, of which 80 are in the English language, 28 in German, 7 in Swedish, and 22 in Norwegian and Danish.

The General Council.—The General Council met in the city of New York, October 18th. The Rev. Dr. A. Spaeth, of Philadelphia, presided. The business of the session consisted chiefly in the continuation of the regular discussion of the ninety-five theses of Luther and the review of the progress of the various missionary and publishing enterprises of the body. The discussion of Luther's theses, to which the Council stately devotes a part of the time of every annual meeting, has been instituted for the comparison of views among the members of the body, and for mutual enlightenment in doctrine, and does not take the shape of formal action. On the present occasion the fifth, sixth, and seventh theses, declaring the impotency of the Pope in the forgiveness of sins, were considered, as follows:

The Pope neither wisheth to nor can remit any punishments save those which he, of his own will, or according to the canons, hath inspired.

The Pope can not forgive any sin, except so far as he doth declare and confirm God's forgiveness; or, indeed, when he forgiveth reserved cases, where, if they be despised, the sin remaineth still.

God verily forgiveth no man's sins, without at the same time subjecting him in all things in humility to his vicar, the priest.

A strong desire was expressed for the union of the synods of the United States on the occasion of the four-hundredth anniversary of the birth of Martin Luther; and the corresponding secretaries were instructed to enter into correspondence with the synods which are one with the Council in the unity of the faith, with that end in view.

The Board of Foreign Missions reported that its receipts for the year had been \$7,278, and that its estimates for expense for the coming year amounted to \$10,000. The mission is in the Presidency of Madras, India, and has its principal stations at Rajamundry and Samulcotta, with numerous sub-stations. It employed four American and European missionaries, two native pastors, two woman missionaries, two evangelists, and forty teachers, and returned 722 children in the schools and 465 persons baptized during 1882 and the first six months of 1883. The German Home Mission Committee had received during the year \$4,447, and had expended \$4,410. Three missionaries had been dispatched to Canada, seven had been appointed to fields within the United States, and a traveling missionary was employed in Texas. The committee was unable to meet the demands made upon it for additional laborers. Thirty-four students were, however, under preparation at institutions in Germany to engage in its work. The Swedish Home Mis-

sion Committee had missions at San Francisco, Cal., Astoria and Portland, Oregon, and Puget Sound, Washington Territory, in Idaho, at Salt Lake City, and in Colorado. The Emigrant Mission had given shelter in its home in New York city to more than 15,000 persons. The House and its mission was now generally known, and the Home Missionary Society in Europe was very generally co-operating with the committee. Mission stations had been established in Bremen, Hamburg, and Antwerp. Castle Garden was regularly visited at each arrival of passengers. The Swedish Augustana Synod was sustaining a mission in connection with the committee's work. A recommendation that the Home Mission Committees be advised to secure the services of one or more traveling missionaries for the purpose of organizing congregations along the line of the Northern Pacific Railroad, and of securing sites for churches, etc., was offered, and referred to the next meeting of the Council. A general committee, which had been appointed the year before in furtherance of the same object, reported progress. A declaration was adopted to the effect that the co-operation of women in the work of the Church was greatly desired. "But as the Church is the proper channel through which all efforts are to be directed, the Council can recognize no other. It must leave to the individual congregation the right to direct its own affairs. If it deem it wise to organize woman's mission societies, it can do so, and will no doubt have the approval of the Council."

The General Synod.—The General Synod met in its thirty-first biennial convention at Springfield, Ohio, May 16th. The Rev. J. G. Morris, D. D., LL. D., was chosen president. Reports were made by the several boards having charge of the benevolent enterprises of the synod, of their operations during the previous two years. The Board of Church Extension had received \$41,791, and had expended \$39,325. It had completed its work in aid of the mission in Brooklyn, N. Y., was helping to build a church in Chicago, Ill., and was arranging for architectural plans to assist in building churches in the mission-fields. The plan for securing an income by apportioning among the churches the amount they would be asked to contribute had been worked with satisfaction and success. The Board of Publication had increased its net assets by \$14,016, the present amount being \$61,767, and reported sales for the year ending March 31, 1883, of \$49,049. It had been able to appropriate from its profits \$5,000 to the benevolent work of the Church as represented in the organizations connected with the General Synod. A history of the Lutheran Church in America was in preparation under its direction. The Committee of the Pastors' Fund had received \$1,951, and expended \$1,541. The Board of Home Missions had received \$38,407, and had paid to missionaries \$24,040. It had the care of 58 missions, which represented 63 congregations, having 3,680 members. The

missions had contributed for all purposes the sum of \$96,544; 18 stations had been added to the list of missions during the two years past, 15 had become self-sustaining, and three had been discontinued. The Board of Foreign Missions had received \$50,741, and reported an increase of 65 per cent. in the contributions of the preceding two years. Its missions were in India, where the first native minister had recently been licensed, and West Africa. The mission in India (Guntoor) returned 6,813 communicants, 1,958 pupils in day-schools, and 4,111 Sunday-school scholars. The mission at Muhlberg, Africa, returned one ordained missionary, one unordained missionary, and one native licensed minister, 120 church-members, 70 of whom were communicants, 40 day-scholars, and 150 Sunday-school scholars.

A communication was received with favor from the delegate of the General Synod, South, and it was resolved to send a delegate to the next meeting of that body. Satisfaction was expressed that the Synod, South, had decided to carry on its foreign mission work under the auspices of the General Synod. The Synod declared that it hailed as one of the most auspicious outlooks of the Church in America the prospect of securing a "common service" for all English-speaking Lutherans, on the general and definite basis of the common consent of the pure Lutheran liturgies of the sixteenth century, and expressed readiness to labor to that end and to unite with the General Synod, South, and the General Council in any judicious movement to accomplish it. A committee was appointed to have the charge, under the direction of the Home Board, of the work of In-

dian missions. Observances were recommended to be made on Nov. 10, 1883, in honor of the birthday of Martin Luther.

Norwegian Lutheran Synods.—The Norwegian Lutherans in the United States are represented in four synods. The largest is the Evangelical Lutheran Synod, which is characterized by the strictness of its doctrine and rules of discipline. It includes about 200 preachers, and has a college at Decorah, Ia., a theological school at Madison, Wis., and several academies. The Augustana Synod has between 80 and 40 preachers, and a seminary at Marshall, Wis. The Norwegian-Danish Conference originated in a schism in the latter body, but has grown to exceed it, having 85 ministers and 24,000 communicants. Its college and seminary are at Minneapolis, Minn. Hauges Synod originated in a sect founded by Elling Eielson, a lay preacher, includes 20 ministers, and has a seminary at Red Wing, Minn.

Movement for the Institution of Bishops.—A feeling has been growing among the Lutherans of the General Council, especially among the Swedish members, whose church in their native country is episcopal, in favor of the institution of bishops. A convention met at Easton, Pa., March 27th and 28th, for the consideration of this subject. The Rev. John Kohler, D. D., of Allentown, Pa., presided. Papers were read on "The Episcopate in the Early Church"; "The Episcopate in the German Reformation"; and "Should we have the Episcopate in the Lutheran Church in America?" and committees were appointed to bring the subject forward for discussion in the several conferences of the Pennsylvania Synod.

M

MADAGASCAR, one of the great islands of the globe. (For map, see "Annual Cyclopædia" for 1882.)

Geography.—It is southeast of the African continent, from which it is separated by the Mozambique channel, which varies in width from 250 to 350 miles. It is 1,080 miles long, and from 225 to 350 miles broad, having an area of nearly 290,000 square miles, fully equal to the combined areas of the New England States, New York, New Jersey, Pennsylvania, Delaware, and Maryland. It is almost entirely within the tropics. The population is estimated at 3,500,000. The capital, Antananarivo, in the interior, contains between 70,000 and 80,000 inhabitants. The chief port is Tamatave, on the east coast, which contains about 3,000 inhabitants.

A mountain-range, having a height of 3,000 to 4,000 feet, and rising occasionally into more elevated summits (one of more than 11,000 feet), extends from north-northeast to south-southwest through the whole length of the island, though broken at three or four points by broad, elevated plateaus, and in several in-

stances by narrow, deep cañons. The mountain-slopes were originally covered with heavy forests, but considerable tracts have been cleared. These forests contained many choice woods, both for building and cabinet use, as well as some valuable medicinal, resinous, and dye-woods. The slopes are generally fertile. Between them and the coast, both on the east and west sides, are extensive marshy tracts with some elevated bluffs, but also with numerous small lakes and ponds, and generally covered with a profuse vegetation. These districts, though fertile when cultivated, are unhealthful. The coast, for some distance from the shores, is sandy, not fertile, and intensely hot. There are two or three good harbors on the east side, of which Tamatave is the best. There are several harbors on the west side, but none of them, except Majunga, is very safe. There are numerous rivers, but those on the east side have so rapid a descent that none are navigable for more than six or eight miles. Of those falling into the Mozambique Channel, several have a navigable course of thirty or forty miles, and one, the Betsibooka, is navi-

gable for 160 miles. The climate varies with the elevation. On the coast it is hot, moist, and unhealthful, and malarial fevers prevail. On the mountain-slopes the climate is mild and delightful, the temperature seldom exceeding 85°. In the rainy season there is some malarial fever, even in these mountain-slopes.

Productions.—The flora, sylvia, and fauna of Madagascar are in marked contrast with those of the African continent across the Mozambique channel, and have an equally marked general resemblance to those of the Eastern Archipelago. The *ravenel*, or "traveler's tree" (*Urania speciosa*), from whose trunk a sweet and wholesome beverage is obtained by incision, is peculiar to the island; while ebony, mahogany, different kinds of gum-trees, coconuts, figs, and other valuable and ornamental woods, and medicinal shrubs, are indigenous here. Among the plants peculiar to the island is the zozero, a species of papyrus, and a lichen which makes a powerful dye-stuff. The flora is of wonderful beauty, and many of the flowers are very fragrant. The silk-worm is indigenous, and its cocoons when fresh are often eaten by the natives. Sheep with hair, instead of wool, and with large, fat tails, have been introduced from the Cape of Good Hope; cattle from India, domestic swine, and horses from other countries, and dogs and oats. The crops are cotton, sugar, coffee, rice, yams, arrow-root, bread-fruit, plantains, bananas, and figs.

Commerce.—Commerce is chiefly carried on in English ships with Mauritius. One of the most important articles of import is rum. The export commerce, which is inconsiderable, consists of cattle, hides, wax, gum-elastic, gum, tallow, oleaginous seeds, etc. The value of imports from Mauritius in 1873 was estimated at £145,000; of exports to Mauritius, £153,000; of exports and imports to and from all other countries, £100,000.

History.—Madagascar was first mentioned by Marco Polo in the thirteenth century, but was not visited by Europeans till 1506, when the Portuguese attempted to plant a colony on the island, but failed. The French made a similar attempt in 1642, and indeed undertook to take possession of the island, but after some years the hostility of the natives, and the climate of the coast, compelled them to abandon it.

At the beginning of the present century, Madagascar was divided among several native tribes, of which two were the most active and powerful. These were the Sakalavas, the principal tribe of the western part of the island, and the Hovas, who held the east and northeast. The Sakalavas were the darker and taller, but the Hovas were quicker and more active mentally. Neither these, nor any of the other tribes of Madagascar, had any affinity with the negro races of Africa. They rather resembled, both physically and intellectually, the natives of the Philippines and of the Polynesian islands. The other tribes submitted to the rule of these two. In 1808 Radama, a Hova prince, became

King of Imerina. He was only sixteen years of age, but soon engaged in war with the Sakalavas, and obtained control of much of the eastern coast and the port of Tamatave. In 1816 he was visited by British agents, and the next year he made a treaty with Great Britain, agreeing to abolish the slave-trade and other wrongs, on condition that he should receive a stipulated quantity of arms and ammunition every year, and men to instruct his people in military tactics. He faithfully observed his treaty, abolishing the slave-trade, though not slavery, and with the arms and instructors in military science received from Great Britain he soon had a fine and well-disciplined army, with which he subjugated the Sakalavas and the other tribes, and became King of Madagascar. In 1818 the London Missionary Society established a mission at Antananarivo, Radama's capital, founded schools, translated the Scriptures, and made great progress in civilizing and Christianizing the people. Commerce increased, manufactures were introduced, and agriculture was greatly improved. Slavery, however, still existed, infanticide was not checked, and the cruel trial by ordeal was not abolished. The idols were not destroyed, and many of the people worshiped them. Still the Christians were in the ascendancy.

In 1828 Radama died, and his queen, Ravalena Manjaka, became the ruler of Madagascar. She had courage, executive ability, a knowledge of state affairs, and a capacity for controlling her people; but she was a bigoted heathen, and bitterly hostile to all Europeans. She had one son, then very young, and was tenderly attached to him. She began by restoring the idols and the idol-keepers to their old places in the capital, and restricting the Christians in their worship. In 1831 she banished the French, who had obtained a considerable foothold, from the island, and in 1835 compelled the English missionaries and teachers to go also. Ere long she prohibited all Christian worship, condemned to death all who avowed themselves Christians, and endeavored to extirpate Christianity from the island. When her son, then a youth of seventeen, avowed himself a Christian, tenderly as she loved him, she was with difficulty restrained from putting him to death. Thousands did suffer martyrdom by her orders. Yet at this very time she maintained a vigorous foreign policy. When, in 1845, English and French cruisers attempted to break her authority, and bombarded and burned Tamatave, and landed their troops to attack the fort, they were repelled with such vigor by the queen's troops, and so thoroughly defeated and routed, that they were glad to escape to their ships. For eight years neither nation attempted to enter a Madagascar port, and when they sought, in 1853, to renew commercial relations, the queen demanded and obtained an indemnity for her losses.

In 1862 the queen died, when her son, Rada-

ma II, reigned in her stead. He attempted to restore Christianity; but he had not inherited the abilities of his parents, and for some cause he became obnoxious to his people, and in 1868 he was assassinated. His widow became his successor by election (the government being constitutional), under the name of Rasuahe-rina I. This queen gave to the missionaries and Christians free toleration, abolished the slave-trade, and checked infanticide and the trial by ordeal. Early in 1868 Queen Rasuahe-rina died, and was succeeded by her sister, who assumed the title of Ranavalena Manjaka II, and in 1869, on the occasion of her marriage with her prime minister, both publicly professed Christianity. The schools were all reopened, and greatly increased in numbers. A large printing-office was established in the capital, and the Scriptures, religious books, and school-books were produced to the amount of more than a million volumes in a year. Many new churches were erected, the number of communicants was stated at 850,000, and the whole of the Hovas and a considerable portion of the Sakalavas and the subject tribes became nominally Christian. There was, however, a strong heathen element among these tribes.

The French, who had regained their former standing on the south of the island and on a small island (Nossi-Bé) at the northwest, had stationed Jesuit missionaries there, and these attempted to win the other tribes away from the Hova influence, and if they could not draw them to alliance with France and to a profession of the Roman Catholic faith, determined, at least, to drive them back to heathenism, and to rebellion against the Hova government. It is a singular fact that since the establishment of the republic in France, while its home policy has been exceedingly liberal, its foreign policy has been controlled entirely by Jesuit influences. At the prompting of these Jesuit missionaries, France soon found or made a cause of quarrel with Madagascar. She claimed that her citizens had met with losses in the island, and she demanded a large indemnity. Unwilling to be involved in a quarrel with a great power, the queen, though believing the claim to be unjust, offered to pay the indemnity, but thereupon the French admiral demanded that Madagascar should be placed under the protection of France, and be governed by French officers. To this gross and unwarranted assumption the queen gave a prompt but courteous refusal, and the French admiral issued his ultimatum, requiring her consent, or he would bombard the port of Tamatave. She persisted in her refusal, and the port was bombarded, and some injury done to English citizens, which the French Government was afterward obliged to apologize and pay for. The Jesuit missionaries were now required to leave the capital; but while the Hovas had been driven out of Tamatave on an hour's notice, and all their goods seized, these Jesuits were allowed three days to dispose of

their effects, and to remove them, and by the queen's orders they were provided with transportation and sustenance to the French lines. Queen Ranavalena sent ambassadors of the highest rank to the Governments of France, Germany, England, and the United States, protesting against the course pursued by the French officers, and asking for treaties with the German, English, and American Governments, and for their protection. Treaties were made with these governments, that with the United States being ratified in March, 1883. They recognize the fact that the Hova government is the only organized government on the island, and make provision for the protection of our commerce there, and of their rights here. While the ambassadors were absent from Madagascar, Queen Ranavalena II died, in July, 1883. Her husband carried on the government till the election of a new queen, which took place in November. The new queen is a cousin of the late queen, and takes the title of Rasuahe-rina II. It is said that she will be required to marry the prime minister, who is the real sovereign.

The French invasion has made no progress since the early autumn. During the reign of the late queen, infanticide and the trial by ordeal were prohibited, under the severest penalties, the slave-trade was completely abolished, the negro slaves, from the African coast, were emancipated, and the domestic slavery—a mild form of peonage, the peons being natives of the island, and belonging to the subject tribes—was greatly mitigated, and will soon be entirely abolished. A regular Parliament is to be established during 1884. The Sakalavas, once a powerful tribe, are now broken into small fragmentary tribes. (For latest exploration, see page 387.)

MAHDI, EL., commonly called "the False Prophet." This name is the title of an expected deliverer of Islam, signifying "He whose path is directed by God." The Fagih Mohammed Achmed claims to be the prophesied Mahdi. The prophecy is ascribed to Mohammed, and is to the effect that in the year 1300 of the Hegira an inspired leader will appear who will complete the victory of the Mohammedan faith on earth. Some of the signs by which he is to be known are, that he shall bear the same name as the founder of Islam; that his right arm shall be longer than his left; that he shall have a wart on his right cheek, etc. Several persons in recent times have been supposed to fulfill the prediction, among them the Emir Abd-el-Kader. The Fagih Ibrahim Sherif ed Din, in Bagirmi, attracted thousands of followers as long ago as 1857, in the character of the Mahdi. Others, in various Mohammedan lands, have undertaken the rôle. The most noteworthy is the head of the Senussi order, Sidi-Mahdi-ben-Senussi, who was announced by his father, Sidi-Mohammed-ben-Ali-es-Senussi, as the coming divine emissary, whose epoch would be marked

by the downfall of the Turkish sultanate, and the re-establishment of the Arab power.

Mohammed Achmed was born about 1842, in Dar Dungal, a district of Nubia, on the left bank of the Nile, in latitude 20°. The inhabitants of this district furnish the bulk of the Gellabas, or itinerant traders, who devote themselves to the slave-traffic, and the Fagih, or interpreters of the Koran, in the Soudan, who, beyond an indifferent acquaintance with the doctrines of the sacred book, and a knowledge of reading and writing, are not superior in education to the rest of this population. Mohammed Achmed, in his youth, worked with his brothers as a boat-builder in Khartoum. Possessed with the desire to become a Fagih, he learned to read and write, and for some time kept a school in Khartoum. He then went to the district of Tamaniat, thirty-two miles north of Khartoum, where he established himself as a Fagih. These teachers of the Koran, since that book embodies the law as well as the religion of Mohammedans, and is supposed to contain all the rules of civil conduct, are the counselors of the people in all the affairs of life. They bear the title of sheik. Nur-ed-Din, another Dongola Fagih, was already settled there, but the Sheik Mohammed Achmed attracted a considerable *clientèle*. Ere long he settled on the White Nile, residing part of the time on the island of Aba, in 18° 20' north latitude, and the rest in a small village, named after himself, on the right bank, a little to the north. Up to this time he possessed no greater influence or importance than the multitude of other Fagihis of the Soudan. He now began the life of a dervish, and took up his abode in a dried-up cistern on the island. For six years he only left his cave on Fridays, to go to the mosque, and passed all his time in contemplation and the study of the Koran. His object was to assume the *role* of the Mahdi, but he gave no intimation of his mission at this time. Reports were spread far and wide of his fasting and meditation, of the emotion he exhibited in reading the Koran, and of his benignant kindness. The custom grew up of visiting the holy man to receive his advice on religious matters. Large crowds of pilgrims to the hermitage extended his fame.

When he had become widely revered as a saint, and felt sure of his influence, he finally announced himself as the man of prophecy. To a large assembly he unfolded his mission in the following language: "Twice already have I been called upon by the archangel Gabriel to unsheathe the sword of the faith, in order to reform the bad Moslem, and establish the peace of the world by a universal Mohammedan empire. To this mission have I been summoned by the Prophet. Follow me, therefore, for I am the Mahdi, and I will lead you into the kingdom which Allah has prepared for the faithful." In the first half of 1881 he issued proclamations to the Arab tribes of

the Kababish, Allowin, and Baggara, saying: "Know that God has chosen me to the great succession, and that the Prophet, lord of life, has announced that I am the expected Mahdi, and has placed me upon his seat over princes and lords; and God is with me in person, and has set upon me the marks of prophecy, which are the warts on my right cheek."

When Raouf Pasha, Governor-General of the Soudan, heard in July, 1881, of these proclamations, he sent Abu Saud to summon Mohammed Achmed to Khartoum. The False Prophet was found in his village, with a guard of a dozen armed Arabs. To the question why he created a disturbance, he said that he was the Mahdi; that he had been called by the Prophet, who appeared to him in his sleep, and that he only preached this to the people. He refused to go to Khartoum, and, when threatened with arrest, declared: "God shields me. Your soldiers will be devoured by the earth and the water." Mohammed Achmed's brothers offered to bring him to Khartoum and furnish security for his good behavior, but Abu Saud inconsiderately declined their assistance. In the expedition of three hundred infantry with a cannon, sent to capture the pretended Mahdi, three officers disputed the command. The troops, on landing, broke up into little bands, which the followers of the Mahdi, exasperated by the act of one of the officers, who shot a man that he mistook for the prophet, cut down without mercy. The steamer lay to before the village, and Abu Saud, who remained on board, made preparations to cannonade the place. Mohammed Achmed rode down to the bank and waited, only a dozen yards from the muzzle of the cannon, while the nervous artilleryman loaded the piece and fired. Such miraculous proofs of divine protection the Mahdi never lost an opportunity of showing. His later exploits, and the circumstances which enabled him to raise the banner of revolt in Kordofan, Darfour, Sennaar, and on the Red Sea coast, are described in another place. (See EGYPT.)

MAINE. State Government.—The following were the State officers during the year: Governor, Frederick Robie, Republican; Secretary of State, Joseph O. Smith; Treasurer, S. A. Holbrook; Attorney-General, Henry B. Cleaves; Superintendent of Common Schools, N. A. Luce; Land Agent, Cyrus Packard; Insurance Commissioner, Joseph B. Peaka; Judiciary, Supreme Court: Chief-Justice, John Appleton; Associate Judges, Charles W. Walton, William S. Barrows, Charles Danforth, William W. Virgin, John A. Peters, Artemas Libby, and John W. Symonds.

Legislative Session.—The Legislature convened on the 3d of January and adjourned on the 15th of March until the 29th of August. On the 16th of January William P. Frye, Republican, was re-elected United States Senator over Harris M. Plaisted, Fusionist, by 27 to 3 in the Senate and 108 to 87 in the House.

There were passed at this session 352 acts and 97 resolves. Among these measures were the following:

Prescribing that, unless otherwise provided in the resolve submitting it, every constitutional amendment shall take effect on the first Wednesday of January following its adoption by the people.

Providing for greater security against fire in buildings used for public purposes, prescribing fire-escapes, the opening of doors outward, etc.

Providing for an annual examination of the accounts of the State Treasurer.

To provide for the establishment of titles to lands among the Penobscot Indians, and for the preservation of evidence of such titles.

Relative to the taxation of horse-railroad companies.

To prevent deception in sales of butter and cheese.

For the prevention of cruelty to animals, prohibiting cock and dog fights, and prescribing the manner of transporting cattle and other animals by rail.

Providing for the granting of conditional pardons.

Amending section 2 of chapter fifty-nine of the revised statutes by striking out in the first and second lines the words following: "No white person shall intermarry with a negro, Indian, or mulatto, and," so that said section, as amended, shall read, "No insane person or idiot shall be capable of contracting marriage."

Restoring the death-penalty for murder.

Providing for the taxation of telephone companies.

Concerning trade-marks and their registration.

The following constitutional amendment prohibiting the liquor-traffic was proposed, to be submitted to a popular vote:

Resolved, Two thirds of both Houses of the Legislature concurring, that the following amendment to the Constitution of the State be proposed, viz.:

The manufacture of intoxicating liquors, not including cider, and the sale and keeping for sale of intoxicating liquors, are and shall be forever prohibited. Except, however, that the sale and keeping for sale of such liquors for medicinal and mechanical purposes and the arts, and the sale and keeping for sale of cider, may be permitted under such regulations as the Legislature may provide. The Legislature shall enact laws with suitable penalties for the suppression of the manufacture, sale, and keeping for sale of intoxicating liquors, with the exceptions herein specified.

The divorce laws were amended so as to read as follows:

SECTION 2. A divorce from the bonds of matrimony may be decreed by the supreme judicial court in the county where either party resides at the commencement of proceedings, for causes of adultery, impotency, extreme cruelty, utter desertion, continued for three consecutive years next prior to the filing of the libel, gross and confirmed habits of intoxication, cruel and abusive treatment, or on the libel of the wife, where the husband, being of sufficient ability, grossly or wantonly and cruelly refuses or neglects to provide suitable maintenance for her: provided the parties were married in this State, or cohabited here after marriage; or, if the libellant resided here when the cause of divorce accrued, or had resided here in good faith one year prior to the commencement of proceedings. Either party may be a witness.

SEC. 3. All decrees of divorce shall, in the first instance, be decrees *nisi*, to become absolute after the expiration of six months from the entry thereof, on the application of either party to the clerk of the court, and on such application the clerk shall enter a final decree; unless the court has for sufficient cause, on application of any party interested, otherwise ordered.

SEC. 4. After a divorce from the bonds of matrimony, the party on whose petition the divorce was granted shall not marry again within two years after

the entry of the final decree, except on permission granted by the court. The party against whom the divorce was granted shall not marry again within two years from the entry of said decree, and not afterward except on permission granted by the court.

Several acts were also passed for the protection of salmon, landlocked salmon, trout, herring, lobsters, moose, caribou, and deer, restricting the pursuit of them.

The Legislature reassembled pursuant to adjournment, received and accepted the report of the committee on the revision of the statutes, and adjourned *sine die*.

Temperance and Greenback Conventions.—A Temperance Convention was held in January, which put forth resolutions declaring that prohibition has been successful in Maine; that alcoholic liquors are unnecessary for medicinal purposes, unchristian for sacramental uses, and not indispensable for mechanics and arts; and asking for a prohibitory amendment.

On September 19th about fifty members of the Greenback party met in Lewiston, and after vigorous opposition adopted resolutions reaffirming the national platform adopted at Chicago, June 9, 1880, and calling a State Convention in May, 1884.

Common Schools.—The State Superintendent of Schools reports that the year 1883 was a very satisfactory one. The amounts of money available for educational purposes were increased \$46,145, making the total resources of the State \$1,079,015, of which amount \$706,848 came from the town treasuries, \$38,554 from local funds, and the balance from the State treasury. The sums expended amount to \$1,001,470, an increase of \$49,121, which leaves a balance of \$77,545 unexpended. The average wages paid to male teachers, excluding board, were \$31.81 a month, an increase of \$2.28, and the average wages paid to female teachers, excluding board, were \$15.36 a month, an increase of 76 cents. The whole number of pupils in the State is returned to the superintendent's office as 218,877, an increase of 870, but the number of different pupils attending school was 146,916, a decrease of 1,072.

Savings-Banks.—The number of savings-banks and institutions of savings doing business in the State is 54, the Pembroke Savings-Bank during the year having voluntarily surrendered its charter. The present number of depositors is 101,822, of whom 80,982 have to their credit a sum not exceeding \$500 each, and the average of the whole being \$308.10 to each depositor. The aggregate amount of deposits Nov. 1, 1883, was \$31,371,868.87. The number of depositors Nov. 1, 1882, was 95,489 and the amount of deposits \$29,503,889.71, showing an increase during the year of 6,333 accounts and \$1,867,979.16 in amount, and a decrease in the average of each deposit of 77 cents. Regular semi-annual dividends were paid by all the savings-banks as follows: One bank 6 per cent. per annum, four banks 5 per cent., five banks $4\frac{1}{2}$ per cent., four banks $4\frac{1}{4}$ per cent., forty banks 4 per cent.

Ship-building and Ship-owning.—The following is a comparative summary for the past two years:

VESSELS.	1882.		1883.	
	No.	Tons.	No.	Tons.
Barks.....			4	8,054·86
Barkentines.....	12	5,997·02	6	8,489·29
Brigs.....			2	986·40

Total.....	2,899	628,122	\$17,880,912	58,014	11,988

Of the vessels owned, 102 are steamers with an aggregate tonnage of 17,869, and valued at \$1,696,645. The total number of men engaged in navigation is 12,868, whose average monthly wages amount to \$26. The average wages in the Waldoboro' district rises as high as \$60, and in the Machias district the average is \$32. In the Castine, Kennebunk, Passamaquoddy, Portland, and Saco districts the average is \$25; in the Bath, Belfast, and York districts it is \$20, and in the Frenchman's Bay and Wiscasset districts it is \$18. The average monthly wages of those engaged in the fisheries is \$32·50—in the Castine district, \$50; Kennebunk and Wiscasset, \$40; Machias, 35; Waldoboro', \$38;

Frenchman's Bay, \$26; Portland and Saco, \$25; York, \$16.

Manufacturing.—The following is derived from the report of the Secretary of State:

COUNTIES.	Assessed value of manufac- turing prop- erty.	Hands em- ployed in manufac- turing.
Androscoggin.....	\$7,699,951	11,520
Arroostook.....	808,833	1,137
Cumberland.....	8,622,336	18,187

Waldo.....	276,525	1,338
Washington.....	1,248,648	3,959
York.....	5,102,389	9,787
Total.....	\$37,124,649	69,904

The statistics of the cotton-manufacturing industries show that the whole number of mills in the State is 26; number of spindles, 786,182; capital, \$12,987,40; amount paid for labor, \$3,608,294; value of materials, \$7,660,008; value of goods manufactured, \$112,783,585; value of products, \$9,939,389; number of hands employed, 14,908. The wages of skilled operators are \$1·88 per day for men, and \$1·17 for women; unskilled, \$1·05 for men, 86 cents for women. Three mills report increase of capacity during the year.

In woolen manufacturing there are 63 mills; capital, \$4,103,160; value of products, \$7,902,161; value of materials used, \$3,526,589; amount paid for labor, \$1,420,595; hands employed, 5,159; wool used annually, 1,404,853 pounds of foreign and 7,551,984 of domestic.

The total number of ice-houses in the State is 64; number of tons cut, 911,500; number of tons shipped, 801,410; capital invested, \$2,007,500; greatest number of hands employed, 6,530; number of teams employed, 578; average wages paid, \$1·53 a day for men and \$2·76 for teams.

The total number of establishments turning out canned products is 104; assessed value, \$638,050; number of hands, 9,509. The following table shows the classification:

MATERIALS.	Facto- ries.	Assessed value.	Hands.
Corn.....	41	\$221,300	2,266
Corn and apples.....	8	12,600	436
Corn, meat, and fish.....	4	11,500	905
Blueberries.....	5	24,100	851
Fish.....	13	69,550	871
Fish and sardines.....	3	6,840	285
Fish and lobsters.....	8	100,800	8,550
Sardines.....	22	92,670	1,640
Lobsters.....	1	1,100	25
Lobsters, sardines, and blueberries..	4	60,000	320

In the granite business there are 44 companies engaged, with an assessed value of property of \$533,100; hands employed, 2,543.

Seventeen companies are in the lime business: capital, \$415,100; hands employed, 822.

In slate the total number of companies doing business is 11: assessed value, \$81,000; hands employed, 420.

There are 45 yards in the State used in ship-building. Capital, \$1,645,500; hands employed, 4,345; average wages of skilled labor, \$2.53; ordinary labor, \$1.78; materials produced in Maine, \$357,500; all lumber, \$1,076,800.

Financial.—The following table shows the financial standing of the counties on the last day of the year 1882:

	Total Liabilities.		Total Liabilities.
Androscoggin.....	\$95,070 64	Penobscot.....	\$54,949 07
Aroostook.....	17,549 98	Piscataquis.....	6,683 18
Cumberland.....	27,652 08	Sagadahoc.....	64,000 00
Franklin.....	1,994 81	Somerset.....	8,241 02
Hancock.....	887 80	Waldo.....	5,068 94
Kennebec.....	28,145 28	Washington.....	
Knox.....	88,576 12	York.....	1,321 06
Lincoln.....	8,472 49		
Oxford.....	1,266 67	Total.....	\$402,628 24

The reduction of the indebtedness of counties for the year 1882 was \$61,438.91. The several counties expended in 1882 the sum of \$5,796,774.39, divided as follows: State tax, \$971,877.59; county tax, \$271,959.32; schools, \$903,698.76; highways and bridges, \$692,415.82; support of the poor, \$352,895.77; all other purposes, \$2,615,190.27.

A net reduction was made in the public indebtedness in the State, for the year, of \$924,572.76.

The number of taxable polls in 1882 was 150,936; in 1883, 152,974. The total valuation in 1882 was \$221,599,220; in 1883, \$225,494,075.

Lumbering.—Of the lumber rivers of the East, the Penobscot, in the magnitude of its product, is far above its competitors. In eighteen years past there has been cut upon the banks of this river and its branches the immense amount of 3,137,903,254 feet of lumber, board measure, and this has been sent to all parts of the world from the port of Bangor. This is an average of 174,327,958 feet a year. The foreign trade declined from 1875 steadily, until in 1879 it was almost nothing, everything going coastwise. The United Kingdom deal-trade was taken from Bangor by St. John, New Brunswick, which, being in a British province, could sell cheaper. Then Bangor's European deals were sawed into New York stuff, which paid better. The West India trade continues.

About one third of the logs cut on the Penobscot are sawed into lumber at the steam-mills on the river at Bangor. The other two thirds are manufactured by the great water-mills which dot the valley at intervals of twelve miles above the city.

The lumber-cut of 1883-'84 will be smaller all over the State than was that of the previous season. The principal reasons are the low prices, a general feeling that the business has been overdone, and the destruction wrought by the recent tornado, which has made many localities impracticable for lumbering. The cut of 1882-'83 was about 175,000,000 feet, the largest for a long while, and, although the water-

courses were not very high, there was an easy driving-pitch in most courses, and only about 7,000,000 feet of logs were hung up or left behind. When the river opened to navigation there were about 35,000,000 feet of old logs at the up-river booms and 12,000,000 feet at the Bangor steam-mills. These amounts, added to the amount of new logs driven in, made a total of 15,000,000 feet for the year's sawing.

Agriculture.—The acres of land under cultivation, including pasturing, are 2,865,661; acres of waste land, bog, etc., number 818,404; acres of hard-wood growth, 1,728,970; acres of soft-wood growth, 2,274,399; acres of water-surface, 476,664; number of farms, 60,835; number of farms occupied by owners, 58,737; number occupied by tenants, 3,408; number of land-owners, 88,213; number of farm-laborers, 12,988; average wages paid per month, \$18.90.

Miscellaneous.—During the year ending Nov. 30, 1883, 48,464 barrels of mackerel were inspected, 15,084 of herring, 307 of alewives, and 1,427 of cod.

The report of the Attorney-General for the year ending Dec. 1, 1883, shows the number of prosecutions and offenses for the year to be 1,343, as follow: homicides, 4; arson, 7; perjury, etc., 4; forgery and counterfeiting, 4; compound larceny, 45; larceny, 83; burglary, 5; robbery, 3; rape, 3; assault with felonious intent, 20; assault and battery, 108; offenses against chastity, morality, etc., 19; malicious mischief, 11; cheating and conspiracies, 7; defects in highway, 5; nuisances, 161; violation of liquor law, 628; other offenses, 170; costs allowed by court and county commissioners, \$59,521.89; amount of fines and costs imposed, \$48,520.01; amount of fines and costs collected, \$39,919.10.

MANITOBA, a province of the Dominion of Canada, formed in 1870. Area, about 125,000 square miles. Winnipeg, the capital, stands at the confluence of the Assiniboine and Red rivers, near lat. 50°. In 1870 it was simply a Hudson Bay Company's post, named Fort Garry, with a population of about 200. The census of 1881 showed a population of 8,000, and since then it has increased to about 25,000. Seven lines of railway center in the city.

History.—Owing to the disturbed state of the colony during the years 1866-'67, the Hudson Bay Company expressed to the Government of Great Britain a desire to give up the civil control of the colony, merely retaining its commercial rights. With a view to amalgamate this territory with the other British-American provinces, provision was made in 1867 in the "British North America Act," for this purpose. The negotiations for the transfer of the territory from the Hudson Bay Company to the British Government, and from it to Canada, were completed during 1868. The company reserved the right of trade, and its forts with the lands surrounding them, as well as one twentieth of all the land between the Lake of the Woods and the Rocky mountains

south of the line of the North Saskatchewan. It was to receive from Canada, through the British Government, £800,000 in cash. By a strange oversight, no mention was made of the colonists in this transfer to Canada, the evident belief being that all residents were officials or servants of the company. This caused dissatisfaction among English, Scotch, and French alike; but no action would have been taken to prevent the peaceable transfer of the district but for other reasons.

In 1868 the settlement was visited by the grasshopper scourge, which reduced the colonists to the verge of starvation. To relieve the distress, and to create a kindly feeling for Canada, the Canadian Government sent agents into the district with authority to construct a road from Winnipeg to the Lake of the Woods, thus intending to give the colonists employment during the winter. But the agents paid small wages, and charged high prices for the provisions sold to the men. Other causes of trouble were as follow: During 1866 and subsequent years the Fenians were active in their hostility to Great Britain, and some of them found their way to this discontented colony and assisted in sowing seeds of corruption. Again, in a settlement so isolated as this one was from Canada, and at the same time contiguous to the United States, there were naturally more American citizens than Canadians; and, even among some of the older residents, stronger ties of business and of friendship had been formed with the country at hand than with the distant Canada. These disseminated republican ideas, and endeavored to overthrow British rule. But the most potent cause of final disturbances was the French Roman Catholic element. These numbered nearly half of the entire population; and they were offended because their race and their religion were not specially recognized at first in the negotiations of transfer. When the Governor appointed by the Canadian Government presented himself in the settlement, in 1869, he was refused admittance by the French party. The "loyal citizens" were then summoned to put down the rebellious party. This the English and Scotch could easily have done; but while they would not actively oppose the transfer, they refused to assist in establishing the authority of Canada, arguing that as Canada had acquired the territory without consulting them, she was in duty bound to establish her authority without assistance from them. The "Provisional Government" was soon after formed, being composed of French- and English-speaking residents, in equal numbers. But the English soon withdrew from all active part in the management of affairs. Local agitations excited the "Provisional Council" to such an extent that one man was tried by court-martial and shot for opposing the French party. This was at once the signal for complete disruption between the English and French residents, and the means of stirring the Canadian Govern-

ment to decided action. Early in 1870 a brigade of soldiers was dispatched from Canada, under the command of Colonel Garnet Wolseley. Great delay and ill-feeling were caused by the refusal of the United States Government to allow the steamers carrying the provisions to pass through the Sault St. Marie canal. From Thunder Bay, on Lake Superior, to Winnipeg is 500 miles. Of this distance over 400 were traversed in small boats without unloading, although for 50 or 60 miles they had to be hauled against strong currents. Often Col. Wolseley himself assisted in the work, wading to the arm-pits. At every portage both the boats and their loads had to be carried over on the backs of the hardy soldiers. It was such work as this that led Sir Garnet Wolseley to say, in his address on returning from the Ashantee war, that "he wished for a battalion of his Canadians—the best troops in the world." The brigade reached Winnipeg in the latter part of August, only to find that the President of the Provisional Government and his *confères* had made a hasty exit from the town. Col. Wolseley was escorted from Lake Winnipeg to Fort Garry (Winnipeg) by the Hon. Donald A. Smith, Governor of the Hudson Bay Company, who formally transferred its territories to Canada. It has since transpired that the leaders in the rebellion were furnished, by order of the Canadian Government, with funds from the Council of Assiniboia, to defray their expenses to the United States—their absence or voluntary banishment being considered the easiest way out of the difficulties.

Physical Geography.—The Red river plain lies between the Laurentian plateau, near the 95th meridian, and the highlands which cross the boundary-line at Pembina mountain, a direct width of 52 miles. The Laurentian plateau is the same that extends north of the St. Lawrence and the great lakes from Labrador to the Lake of the Woods. At this point it turns suddenly northward and continues onward till finally lost on the Arctic Ocean shores. This plateau—or, as many geographers term it, this mountain-range—forms on the one hand the water-shed between the great St. Lawrence lakes and Hudson and James bays, and on the other between Hudson Bay and the Arctic Ocean. The only depression or break in the whole length is where the Nelson and the Churchill flow through into Hudson Bay.

The first steppe includes the valley of Red river and the country immediately surrounding Lakes Winnipeg, Manitoba, and Winnipegosis. The average height of this plain is 800 feet above sea-level. It embraces, including 14,000 square miles of lakes and drowned lands, about 56,000 square miles. The northern portions are covered with timber, while the southern are either entirely bare, or thinly covered with poplar. In short, wherever the prairie-fires have swept, there are no trees. The southern portion of this plain, from Minnesota and Dakota to Lake Winnipeg, about 7,000 square

miles, is very fertile. This plain does not include any of the *Coteau de Missouri*, or the "Height of Land," lying chiefly south of the 49th parallel and extending to the mountains.

The soil has a rich dark color, due to the accumulation of prairie-fire remains, to the deposits of the millions of wild fowl that even still frequent the province, and to the droppings and bones of the buffalo that now frequent it no more. Like all prairie-land, it is hard to "break," but when broken is easily tilled. The marly alluvium underlying the surface is also a soil of the best quality.

Climate.—Like the climate of the whole interior of North America, that of Manitoba is very warm in summer and very cold in winter. The autumn is colder than in Ontario or in northern New York, while the spring is from one to three weeks earlier. Once the spring begins, it becomes warm suddenly. The mean annual temperature at Fort Shaw is 46° 91'; at Winnipeg, 34° 31'; at Toronto, 46° 05'.

The rapid spring and warm summer, and the entire absence of frosts during those periods, satisfactorily determine Manitoba's fitness for agricultural pursuits. The winters in the Red river settlement are undoubtedly severe; but, owing to the great dryness of the atmosphere, the cold is not felt nearly so much as in more southern moist climates.

Vegetation is rapid, and fruits, flowers, and garden vegetables grow to maturity with as little danger from frosts as in central Ontario.

The following figures represent the average yield per acre, of the named products, for the five years ending 1881. (In all cases fractions are thrown off.)

	1877.	1878.	1879.	1880.	1881.
Wheat	26	26	26	29	30
Oats	59	59	58	57	59
Barley	40	68	57	41	40
Peas	32	34	32	33	33
Eye	30	30	40	40	35
Potatoes	304	308	302	318	330
Turnips	1,000

In 1881 farmers residing near Winnipeg exhibited at the local fairs roots and vegetables of the following dimensions: Cabbage, 49 pounds; carrots, 11 pounds; turnips, 32 pounds; potatoes, 4 pounds; squash of seven weeks' growth, 5 feet 6 inches around; onions, 4½ inches through; citrons, 18 pounds; mangolds, 27 pounds; beets, 23 pounds.

Settlement.—During 1881 and 1882 more than 150,000 immigrants settled in the Canadian Northwest. In the first four months of 1883 there were 25,000. These are chiefly from Great Britain, Germany, Norway and Sweden, and Canada—at least 60,000 from the latter.

Fuel.—Coal or lignite underlies the whole country from the 49th parallel to the Arctic Ocean, and from the Souris river, 250 miles west of Winnipeg, to the Rocky mountains. The following are some results of analyses made of coal from the various localities along the line of the Canada Pacific Railway:

LOCALITY.	Distance from Red river.		Thickness of seam.		Fixed carbon.		Volatils combustible matter.		Ash.
	Mile.	Feet.	In.	Per ct.	Per ct.	Per ct.	Per ct.		
Souris valley	256	2	3	45.48	39.77	2.76			
Souris valley	268	3	3	48.18	35.90	5.92			
Souris valley	268	6	6	34.32	48.30	4.88			
Souris valley	268	7	8	49.31	38.98	4.71			
Great valley	344	5	0	48.61	34.90	4.49			
Great valley	346	4	0	33.63	44.48	4.89			
Porcupine	390	13	0	46.20	35.14	6.66			
Porcupine	391	18	0	36.38	39.97	11.70			
Bow river	650	6	0	55.70	29.81	8.78			
Belly river	700	4	6	56.54	31.08	5.91			

The figures indicate the quality of the coal in the river-valleys. As the banks of the streams are very high, the seams are all exposed, and can be worked horizontally. There are many smaller seams, both above and below the main seams. In the Bow and Belly river districts the coal is somewhat better than on the Souris. The deep river-valleys are found only in the second and third prairie steppes. The average height of the second steppe is about 1,800 feet above the sea. The escarpment forming its eastern limit crosses the boundary at Pembina mountain, and continues northwesterly by the Blue hills of the Souris, the Blue hills of Brandon, Riding, Duck, Porcupine, and Basquia hills. It has a width of 250 miles along the 49th parallel, terminating about the 104th meridian. This vast undulating plain, having a greater elevation, has been acted on by the rivers for a much longer period than the first plain. On a near approach to one of these rivers, the traveler finds himself on an almost precipitous embankment, overlooking, at a height varying between 50 and 350 feet, a broad, level valley, from 500 to 5,200 yards in width. Through the "bottom" meanders the stream, its surface usually some five or ten feet lower than the valley, unless in the spring, when the "bottom" becomes one great lake or river. These valleys, as well as the slopes and gravelly knolls, are as a rule well timbered with oak, birch, poplar, aspen, etc. These "coulées" and the various marshy tracts are the only effective barriers to the destructive prairie-fires in their career over the vast plains. The soil of this steppe closely resembles that of the first, but it is not so deep.

As the second steppe differs from the first, so does the third from the second. Its average height is about 2,000 feet, and its breadth along the 49th parallel about 465 miles. The section lying immediately along the line is not considered good for farming, inasmuch as the northern limit of the "Great American Desert," or the *Coteau de Missouri*, extends for about fifteen miles into Canada for nearly eighty miles along the boundary. This strip is almost devoid of vegetation, its chief product being a thin growth of cactus and stipa. Immediately north of this unfruitful tract, and stretching far away north and northwest to the 60th parallel, extends in one almost unbroken prairie a great

fertile belt. The northern portions are in some places well wooded. The southern is indented with deep river-valleys, often very broad, and being themselves intersected with new systems of "coulées" and gorges. These secondary systems are well wooded.

The regulations for the sale of land are easily complied with, the advantage being as much in favor of the settler as is consistent with security from fraud for the Government. The whole country is being surveyed into townships six miles square, each containing thirty-six sections of 640 acres. These are further divided into quarter-sections of 160 acres. Two of the thirty-six sections are set apart for school purposes, and alternate lots within twenty-four miles of the railway belong to the railway company. To settlers the Government presents a homestead of 160 acres, on conditions of cultivation and actual residence for at least six months in each year for three years. The settler may, in addition, pre-empt another quarter-section. The entire 320 acres must be partly tilled for three years, at which time the holder has the first right of purchase from the Government of the pre-empted 160 acres. Before an alien may take up a homestead, the oath of allegiance must be taken.

Government.—Manitoba and the Northwest Territories are all governed by one Lieutenant-Governor and Council, partly appointed by the Canadian Government, and partly elected by the settlers. The present capital is Regina, in Assiniboia. Justice is administered in the Territories by stipendiary magistrates and the Northwest mounted police. This force consists of 475 officers and men. Its chief duties are to preserve order among the Indians, prevent stealing, and suppress the liquor-traffic.

Education.—The public-school system of Manitoba is largely modeled on that of Ontario, and is administered by a Board of Education, appointed by the Lieutenant-Governor in Council, consisting of twenty-one members, twelve Protestants and nine Roman Catholics. The appointments are for three years, provision being made for the retirement of seven members annually. The board is empowered to resolve itself into two sections, consisting of Protestant and Roman Catholic members respectively, and each section has the entire management of all the schools of its denomination throughout the province. The increase in the attendance at the public schools has kept pace with the rapid development of the province itself, as may be seen by the following table, which shows the attendance at the Protestant public schools:

YEAR.	No. of schools.	Attendance.	YEAR.	No. of schools.	Attendance.
1871.....	16	816	1877.....	88	2,027
1872.....	17	1,095	1878.....	50	2,670
1873.....	17	1,108	1879.....	99	3,614
1874.....	22	1,248	1880.....	101	3,785
1875.....	26	1,595	1881.....	125	4,919
1876.....	30	1,600	1882.....	192	6,972

The Normal School consists of two departments; that for Protestants being in connection with the Protestant schools of Winnipeg, and that for Roman Catholics in connection with the Roman Catholic schools of St. Boniface. The principal of the Protestant department of the Normal School visits various parts of the province during a portion of the year, for the purpose of holding normal institutes.

St. Boniface College was founded shortly after the arrival of the Selkirk colonists, for the training of the children of the employés of the Northwest Company. It was incorporated by act of Parliament in 1871, and is in a flourishing condition.

St. John's College, a mile and a half north of Fort Garry, was founded many years ago. In 1866 it was enlarged by the Bishop of Rupert's Land, and was incorporated in 1871. This institution is under the control of the English Church.

Manitoba College was established by the General Assembly of the Presbyterian Church in Canada in 1871. It was incorporated under its present name in 1878, and has rapidly risen to a foremost position among the educational institutions of the country.

The University of Manitoba was established in 1877, by the united action of all the denominations in the province. Protestants and Roman Catholics agreed that it would be much better to have only one degree-conferring institution in the province, and that all existing colleges and all others that may be founded in future should be affiliated with it.

MARIO, Giuseppe, Marquis de Candia, an Italian singer, born in Cagliari, Sardinia, Oct. 18, 1810; died in Rome, in December, 1888. He entered the military service of Sardinia, but soon became offended with his assignment, and offered his resignation. As the Government refused to accept it, he ran away. He had received a good musical education, and, having a fine tenor voice, he soon made a place for himself in the musical world of Paris. He was in debt, and accepted an engagement at the French Opera (assuming the name of Mario), where he made his *début* in December, 1838, in "Robert le Diable," and achieved immediate success. The next year he sang with Rubini at the Italian Opera, and he soon gained recognition as the first tenor singer on the stage. He visited Russia in 1845, and remained there five years; then went to London and Paris, singing in those two cities alternately for four years. For some time previous to this, Grisi had lived with him as his wife, and finally they were married. In 1854-'55 they made a tour through the United States, and sang in the principal cities. Mario made a farewell appearance on the stage at Covent Garden, London, in June, 1871; but in 1872 he made another concert tour in the United States. By this time, however, his voice had begun to fail, and it was evident that his singing days were over.

Mario made large amounts of money by his profession, but was comparatively poor in his old age. He had a valuable collection of manuscripts and autographs, which he left to one of his three daughters, Mrs. Vaughan.

GIUSEPPE MARIO.

MARYLAND. State Government.—The following were the State officers during the year: Governor, William T. Hamilton, Democrat; Secretary of State, James T. Briscoe; Treasurer, Barnes Compton; Comptroller, Thomas J. Keating; Attorney-General, C. J. M. Gwinn; Adjutant-General, J. Wesley Watkins; Commissioner of Lands, William H. Haywood; Tax Commissioner, Levin Woolford; Insurance Commissioner, Jesse K. Hines. Judiciary, Court of Appeals: Chief-Justice, James L. Burtal; Associate Judges, J. M. Robinson, John Ritchie, L. T. H. Irving, R. H. Alvey, Frederick Stone, George Yellott, and Oliver Miller.

Finances.—The condition of the treasury is shown by the tables of the Comptroller for the fiscal year ending Sept. 30, 1883:

Total receipts during the fiscal year	\$2,097,376 88
Balance in the treasury, Sept. 30, 1882.....	638,506 63
Total	\$2,735,883 51
Disbursements for the fiscal year	1,758,699 99
Balance in the treasury, Sept. 30, 1883.....	\$952,183 52

The receipts into the treasury for the year were from the following sources:

From the direct tax.....	\$967,618 11
From internal improvement companies—dividends and interest.....	281,552 99
From ordinary sources, to wit: Licenses, tax on gross receipts of railroads, tax on insurance and commissions, etc.....	868,205 78
Total receipts for fiscal year 1883.....	\$2,097,376 88

For the fiscal year 1883 there were no legislative and attendant expenses, and not a dollar was carried out of the treasury proper to the credit of the sinking fund; hence the large balance in the treasury at the end of this year.

Says Gov. Hamilton, in his message:

It appears that there was due from the treasury proper to the four general loans the sum of \$1,553,307.09 for receipts received from the special taxes laid for their exclusive use. There is but \$191,190.48 in the sinking fund to the general account, and the surplus in the treasury to meet it, and if both could be applied to these loans there would still be left a balance of \$379,933.09 due them from the treasury.

All this large sum was wrongfully taken for other purposes and illegally expended upon other objects; in fact, supplied the means for the extravagances and abuses of the past. The laws creating the debts expressly directed that the revenues from taxes laid by them should be applied to the debt, and the Constitution expressly forbids that they should be used for any other purpose; yet neither was observed.

Had they been regarded at all, there could not be that general balance in the treasury that is made to appear at the end of the last fiscal year. That general balance does not belong to the treasury proper. It should be to the credit of the sinking fund and invested in securities for the payment of these debts as they become due.

The public schools got but \$468,970.17 for the last fiscal year, when the tax for their benefit yielded \$516,004.76. The difference of \$49,034.62 is in the general balance in the treasury, and goes to make up this surplus.

The proceeds from the internal improvement companies are pledged to the payment of the debt and interest. These have also to some extent been diverted.

The public debt of the State at the end of the last fiscal year was \$11,269,822.89.

The interest on the public debt for the last fiscal year was \$646,165.16. For the present fiscal year, ending Sept. 30, 1884, it will be \$578,586.38, and annually thereafter, until reduction of debt, \$556,060.14.

The productive assets of the State in internal improvement companies at the end of the last fiscal year (1883) are as follow:

Stock in Baltimore and Ohio Railroad Company..	\$968,615 70
Stock in Washington Branch.....	550,000 00
Stock in Baltimore and Frederick Turnpike Company.....	11,000 00
Bonds in Baltimore and Ohio Railroad Company.	866,000 00
Bonds in Northern Central Railroad Company (mortgage).....	1,500,000 00
Total.....	\$3,895,615 70

In addition to this there was a partial payment (\$36,000) made during the last year on

the mortgage of the Susquehanna and Tidewater Canal paid by the Philadelphia and Reading Railroad Company.

State Institutions.—The Deaf and Dumb Asylum at Frederick has been receiving an annual appropriation of \$25,000 for its support. Its last report shows 119 pupils in attendance. The House of Correction is a large annual charge upon the treasury. It promises, however, financial improvement. There were 179 inmates Sept. 30, 1881; 276, Dec. 1, 1883; and 340 at the close of the year. The Penitentiary is self-sustaining. The average annual number of prisoners has been as follows: 1876, 727; 1877, 815; 1878, 939; 1879, 813; 1880, 648; 1881, 645; 1882, 510; 1883, 592.

Conduct of Elections.—On this subject Gov. Hamilton says:

The late registration of voters was conducted with general satisfaction. By the act of 1882, chapter 22, section 2, Baltimore was divided into groups of three precincts in each ward, with a register assigned to each group, making in all sixty registers for the general registration, and for the revision the year following, and to continue until the present session, when the Governor is required to appoint one register for each ward with a yearly salary of \$500; thus superseding the group or precinct registration and returning to the old ward system. The objections to making this a salaried office are apparent and forcible, and a return to the old system will soon and certainly result in the accumulation of names upon the registration-books, and with them all the old abuses of which so much complaint was made. I recommend that the law be so amended that the group system for revision be re-established.

The law for the general conduct of elections should be revised and amended.

Every person elected or appointed to office, before taking it should be required to make oath that he had not, either directly or indirectly, been guilty of bribery, and in all its forms to be prescribed in the oath; and it is to be regretted that the present Constitution omitted even the qualified oath of the kind contained in the old Constitution.

Civil-Service Reform.—On this subject the Governor says:

The civil service in the State requires distinctive reformation. All assessments upon office-holders, whether State or national, for political purposes, should be prohibited; all interference by office-holders in primary meetings, conventions, and in elections, except to vote, should also be prohibited, with penalties and measures for conviction sufficient to enforce an observance of the law. This prohibition should be especially applied to the oyster, the inspection, canal, and school services for the State, and to the police of the city; and in addition to the other penalties prescribed by law, that there be added dismissal from such service for a violation of the law.

Party Conventions.—The Democratic State Convention met in Baltimore on September 19th, and nominated the following ticket:

For Governor, Robert M. McLane, of Baltimore; State Comptroller, J. Frank Turner, of Talbot; Attorney-General, Charles B. Roberts, of Carroll.

The Republican State Convention also met in Baltimore, on the 27th of September, and nominated the following ticket:

For Governor, Hart B. Holton, of Baltimore county; Comptroller, Washington A. Smith, of Dorchester county; Attorney-General, R. Stockett Mathews, of Baltimore city.

Messrs. Smith and Mathews subsequently declined nomination, and the executive committee placed in nomination James C. Mullikin, of Talbot county, and Frank H. Stockett, of Annapolis, for the respective places.

Election Returns.—At the election in November, the Democratic State ticket received a majority. The following is the vote:

	Democratic.	Republican.
Governor.....	92,694	50,707
Comptroller.....	98,683	50,099
Attorney-General.....	98,767	50,021

The Legislature, to meet in 1884, will consist of 14 Democrats and 12 Republicans in the Senate, and 63 Democrats and 28 Republicans in the House.

In the city of Baltimore a Republican sheriff was elected on a fusion ticket by a vote of 27,839 against 26,542 for the Democratic candidate, while the regular Democratic candidate was chosen Superior Court Clerk by a vote of 28,445 against 27,853 for a fusion Democrat. In October Ferdinand C. Latrobe, Democrat, had been re-elected mayor over the citizens' candidate by a vote of 29,147 to 25,669. For members of the City Council a majority in sympathy with the reformers were chosen.

MASSACHUSETTS. State Government.—The following were the State officers during the year: Governor, Benjamin F. Butler, Democrat; Lieutenant-Governor, Oliver Ames; Secretary of State, Henry B. Pierce; Treasurer, Daniel A. Gleason; Auditor, Charles R. Ladd; Attorney-General, Edgar J. Sherman; Secretary of Board of Education, John W. Dickinson; Secretary of Board of Agriculture, John E. Russell; Insurance Commissioner, Julius L. Clarke, succeeded by John K. Tarbox; Railroad Commissioners, Thomas Russell, Clemens Herschel, and Edward W. Kinsley; State Librarian, C. B. Tillinghast. Judiciary, Supreme Court: Chief-Justice, Marcus Morton; Associate Justices, Waldo Colburn, Oliver Wendell Holmes, Jr., Walbridge A. Field, Charles Devens, William Allen, and Charles Allen.

Legislative Session.—The Legislature convened on January 3d, and adjourned on July 27th. The session was the longest on record. On January 18th George F. Hoar, Republican, was re-elected United States Senator by a vote of 148 against 36 for John D. Long, Republican, 88 for Samuel W. Bowerman, Democrat, and 5 for others.

The acts approved by the Governor numbered 235, those approved by the Lieutenant-Governor 4, those becoming laws without signature were 40, the number enacted being 279.

By the requisite votes, a majority in the Senate and two thirds in the House, the Legislature passed a resolve providing for such an amendment to the Constitution that, beginning in 1884, State elections shall occur but once in two years, and that, beginning with 1885, the Legislature shall hold biennial sessions; it also provides that a person shall be eligible as Treas-

urer and Receiver-General for three successive terms, and no more. This measure must be acted upon favorably by the Legislature of 1884, and accepted by a majority of the people, to become a portion of the Constitution.

The session was chiefly remarkable for the number of bills which the Governor vetoed; but one of them was passed over the veto, the large Democratic minority making such a thing impossible as long as party lines were maintained. After the first trial of strength there was a break of party lines, which widened as time went on, several of these vetoes being sustained by a vote of nearly two thirds in their favor. That on which most time was spent and which attracted the most attention was relative to a bill to incorporate the Union Safe Deposit Vaults of Boston.

The length of the session was chiefly due to a prolonged investigation by a joint committee of the two houses into the condition and management of the State Almshouse at Tewksbury. The investigation, comprising sixty-five hearings, and extending over a period of three and a half months, was extraordinary in some of its features.

The special charges contained in Gov. Butler's inaugural address were as follow:

Have there not been scandals, public and well known, for years in that institution! Was it not charged, and never denied, that, for years, of the infants born in or sent to that institution more than 90 per cent. died as such? All of these did not fill an infant pauper's grave, even; for it can be shown that from 160 to 250 infant corpses were annually sold as merchandise to a single medical institution in the State, for from three to five dollars each. Many, if not all, came from thence, besides large numbers of bodies of pauper adults, furnished for other medical purposes, and sold as merchandise for very considerable sums; and that done secretly, and not under and in accordance with the provisions of the law, which, under certain safeguards, permit almshouses to furnish the unclaimed bodies of deceased paupers for dissecting purposes to surgeons and medical schools, according to the decent and humane provision of the statute. Was this not in testimony before a grand jury? Has it not been publicly known? What record has the State of these dead infant children, to whom it took the place of parent? What account, even, has ever been returned of the price of this merchandise of the ghoul's? What record of birth or death or burial-place, by which such bodies could be identified or classified!

Another charge was, that one of the trustees had said that he made enough out of the commissions on what was bought for the institution to pay him for his time. Another was, that the salaries of the State institutions were 70 per cent. of the appropriations.

A majority of the committee reached a conclusion that the Governor's charges were not sustained, and their report was approved by the Legislature. In relation to salaries the report says: "We dispose of the latter, so far as it touches this institution now, by stating that the appropriation for the Tewksbury Almshouse last year was \$98,000, and of this \$20,000 went for salaries of officers and wages of attendants and nurses. The per cent. in this

case is less than twenty-two. Our conclusion as to the trustees is that while we find in the records and in their action evidence of carelessness, we do not find anything to impeach their substantial integrity and efficiency."

Finance.—There are no temporary loans to provide for, and there has been no increase of the funded debt during the year.

Funded debt, Jan. 1, 1888.....	\$82,511,680 00
It has been reduced by the following payments from the sinking funds, viz.:	
Coast-defense loan.....	\$877,000
Bounty-fund loan.....	198,000
	<u>1,075,000 00</u>

Funded debt, Jan. 1, 1884..... \$81,436,680 90
Scrip to the amount of \$11,000 of the Coast-defense loan and of \$2,000 of the Bounty-fund loan, now outstanding, will be paid from the sinking funds, on presentation to the Treasury Department. No further installment of the public debt will be due and payable until 1888.

SINKING FUNDS.	
Amount Jan. 1, 1888.....	\$16,944,268 05
Reduced by payment of Coast-defense loan.....	\$877,000
Reduced by payment of Bounty-fund loan.....	198,000
	<u>1,075,000 00</u>

Total.....	\$15,969,268 05
Amount of sinking fund, Jan. 1, 1884.....	16,886,180 55

Increase..... \$966,917 50

Troy and Greenfield Railroad and Hoosac Tunnel.—The contracts under which these are operated run till Oct. 1, 1887.

Total income of the State for the year ending Sept. 30, 1888.....	\$299,887 88
Operating expenses same period.....	168,514 68

Net earnings..... \$130,373 15

No account is taken in this connection of the Southern Vermont Railroad, which is under lease for a fixed rental of \$12,000 yearly.

Expended by manager in construction, same period.....	\$288,615 29
Balance on hand Sept. 30, 1888, unexpended....	142,967 95

Of the double track ordered by the Legislature, and continued under several appropriations, 85.5²/₇ miles have been completed and are now in actual use. It is expected that the road-bed will be ready early in the coming summer. No considerable expenditure has been required in the tunnel during the year.

The Treasurer of the Commonwealth furnishes the following memorandum as to the funded indebtedness on account of the railroad and tunnel:

1888—April 1st.....	\$2,968,565 00
October 1st.....	109,496 25
1889—July 1st.....	2,011,824 45
October 1st.....	142,568 45
1890—April 1st.....	200,000 00
October 1st.....	308,129 55
1891—April 1st.....	216,500 00
July 1st.....	8,618,242 75
1892—April 1st.....	200,000 00
July 1st.....	400,000 00
October 1st.....	465,000 00
1894—April 1st.....	85,000 00
July 1st.....	800,000 00
1895—January 1st.....	1,506,151 75
July 1st.....	1,200,000 00
1897—September 1st.....	370,000 00
Total.....	<u>\$14,198,028 90</u>

Sinking fund needed Jan. 1, 1884.....	\$10,569,330 00
On hand Jan. 1, 1884.....	5,985,294 29
Deficiency	\$4,584,036 31

"It must be apparent," says Governor Robinson in his message to the Legislature of 1884, "that no probable increase of net earnings will meet this deficiency, and therefore I submit to you whether it is not wise to enter upon the accumulation of the sinking funds, or in some other practicable way to provide to meet the whole debt at its maturity."

From the annual abstract of polls, property, taxes, etc., as assessed May 1, 1883, an increase in the total valuation will appear to the amount of \$47,083,638, of which \$36,586,927 is in real estate, and the remainder in personal property. Polls, dwelling-houses, and horses have increased, while cows and sheep have decreased.

Compared with twenty years ago, the exhibit of improvement is the clearest refutation of the charge that Massachusetts is in the way of deterioration and decay.

	May 1, 1863.	May 1, 1883.
Number of polls	275,738	498,838
Total valuation	\$297,150,983	\$1,781,297,061
Number of horses.....	89,326	149,289
Number of cows	153,905	109,879
Number of dwelling-houses..	183,528	291,991

The gain in the population of the State during the same period was about 45 per cent.

The total tax for State, county, city, and town purposes for 1883 was \$26,823,432, an amount greater than the total for any other year except 1874. It needs no argument to show that nearly the whole of this burden results from municipal action and not from assessment by the General Court. The State tax for 1883 was \$1,500,000.

Education.—During 1883 there was raised by taxation, for all common-school purposes, the sum of \$5,499,717.83. Add to this the income from funds and other sources, \$318,468.19, and you have a total of \$5,818,186.02. This sum supported 6,246 schools of the different grades, paying for the services of 9,285 teachers, and affording instruction to 835,872 pupils, whose percentage of attendance was 88.72. All the schools in the Commonwealth have been kept in operation the average time of eight months and nineteen days, the law requiring for all grades below the high-school only six months. Thirty-seven cities and towns have supported evening-schools, having 11,112 scholars. Ninety per cent. of the whole school population have the privileges of high-school instruction.

In addition to the amount paid for public schools, Massachusetts expended in 1883, for the deaf and dumb, the blind, the idiotic, the children at the State Primary School, the boys at the Reform School, and the girls at the Industrial School, more than \$180,000.

Out of the whole population of 1,783,085, in 1880, only seven tenths of one per cent. were native-born illiterates, less than that of any other people in the world. The foreign-born

illiterates made nineteen and six tenths per cent.; but four fifths of the foreign-born illiterates were upward of twenty-one years of age.

Savings-Banks.—The statement to Oct. 1, 1883, is as follows:

Number of banks	163
Number of depositors.....	813,335
Total of deposits.....	\$252,607,598 02
Increase in number of depositors during the year	40,487
Increase in total of deposits during the year..	\$11,296,290 58

The condition of the banks is generally satisfactory. Owing to the gain in deposits, and to the scarcity of other authorized securities, many banks have largely increased their loans on personal security.

Militia.—The entire strength of the militia allowed by the laws now in force is 834 officers and 4,436 enlisted men. In the service at the present time there are 305 officers and 3,587 enlisted men. The Adjutant-General reports:

Total amount of appropriations controlled by the Military Department for the year 1883 is.....	\$160,200 00
The total expenditure (including all contracts to date, and a small amount estimated to cover bills to come in) is about.....	141,536 26
From the latter amount should be deducted the expenditures on account of war records, soldiers' messenger corps, etc.....	7,946 04
Leaving the actual expense.....	\$138,950 32

A high degree of efficiency and military knowledge has been attained by the militia.

Health, Lunacy, and Charity.—The Legislature of 1879 accomplished a thorough reorganization of the administration of the public charities—abolishing some boards, consolidating others, and simplifying the whole system. The Board of Health, Lunacy, and Charity, as then and now constituted, consisting of nine persons, is given general supervision over the State Lunatic Hospitals, the State Almshouse, the State Workhouse, the State Primary School, the State Reform School, and the State Industrial School. Other powers, ample and specific, are granted, enabling the board to hold substantial control over those institutions, and over other matters committed to it.

Gov. Robinson says: "I have been urged to recommend to you an abolition of the board, and the creation of two or three in its stead. But, after much reflection and extended inquiry, I must withhold that recommendation for the present."

State Institutions.—There is an imperative demand for increased accommodations for the insane. The hospitals are crowded, and hundreds of inmates are compelled to occupy temporary cots or beds in the corridors and upon the floors. The Governor believes that great economy of room is possible under a wise system of classification, separating the harmless, the criminal, and the dangerous, and under other improved arrangements which professional knowledge and experience will advise.

The financial affairs of the hospitals are reported in excellent condition. The surplus accumulated at Taunton, Worcester, and Northampton has been increased, while at Danvers

the Treasurer's report shows a balance of \$1,172.14, so that the \$10,000 for an anticipated deficiency has been added to the surplus.

The demand for the abolishment of the Industrial School appears to be based solely on the fact that the average number of girls there is small, being only from sixty-seven to seventy-six during the last four years. No one appears to doubt the helpful influences of the school and of its system of auxiliary visitation; but it is said to cost too much.

The Liquor Law.—The act of 1875 to regulate the sale of intoxicating liquors, as amended subsequently, continues in force. Under the local-option provisions, the will of the people in the different municipalities is annually expressed for or against the issuing of licenses. From the records in the office of the Secretary of the Commonwealth, of the votes in 1882 and 1883, we present the following statement:

	1882.	1883.
Number of towns that voted for license...	59	71
Number of cities that voted for license....	16	14
Number of towns that voted against license.....	266	258
Number of cities that voted against license	5	8

The total number of votes "Yes" and "No" in the State was—

	Yes.	No.
1882.....	88,238	76,908
1883.....	94,094	82,505

For license fees the receipts of the Commonwealth amount to—

1882.....	\$646,715 93
1883.....	687,106 80

Fisheries.—Notwithstanding the heavy losses in the Gloucester fisheries—17 vessels, aggregating 1,119 tons—there was a substantial increase in the fishing tonnage. During the year a number of new vessels were built and added to the fleet, the increase being larger than for any other year since 1875—namely, 46 vessels, aggregating 8,685 tons. The mackerel-fishery, on which great reliance is placed, was attended by a light catch, which was not counterbalanced by enhanced prices.

The "Whalemens Shipping List," of New Bedford, has published its annual review of the whale-fishery. The failure of the Arctic season, with small catches in other localities, brought but small remuneration to those who risked their capital in the whale-fishery. The fleet now numbers 125 vessels of all classes hailing from Atlantic ports, against 138 a year ago, and 19 from San Francisco, as against 8 last year. The number of vessels engaged in sperm-whaling has considerably diminished.

Of the 144 vessels now engaged in the whale-fishery, 94 belong in the district of New Bedford, 7 in Edgartown, 12 in Provincetown, 4 in Boston, 6 in New London, and 2 in Stonington. The other 19 hail from San Francisco. The total tonnage of the fleet is 83,119.

Divorce.—Gov. Robinson, in his message to the Legislature, says:

Up to 1860, full divorce was permitted in this State for five grounds only—adultery, impotency, union for three years with a religious sect denying the validity of marriage, imprisonment at hard labor for five years, and desertion for five consecutive years to the deserting as well as to the deserted party, with the proviso, however, that divorce to the deserting party should be limited to cases in which it was proved that the desertion was for extreme cruelty, or, in case of the wife, neglect by her husband to provide. The laws at present allow absolute divorce for four other causes than those just enumerated: extreme cruelty, gross and confirmed habits of intoxication, cruel and abusive treatment, and neglect to provide. The laws relating to remarriage have also been so modified that the guilty party against whom a divorce has been procured, even on the ground of adultery, is allowed to marry again at the expiration of a certain period.

While the number of marriages increased from 10,878 in 1863 to 17,684 in 1882, or 62.6 per cent., and the population increased 53.4 per cent., the number of divorces rose in the same period from 207 to 515, or 147.6 per cent. During the last ten years the ratio of increase in the number of marriages has been 7.6 per cent., against 14.7 per cent. for divorces. During these twenty years it appears that 36.5 per cent. of the total number of divorces were for adultery and 42.5 per cent. were for desertion, or 79 per cent. for the two causes combined. The largest percentage of increase in the number of divorces for the last ten years has been in Dukes and Nantucket counties, and the smallest in Suffolk.

Women in Office.—In the latter part of the year, Gov. Butler undertook to remove from office Mrs. Clara T. Leonard, a member of the State Board of Health, Lunacy, and Charity, on the ground that a woman was not eligible to the office. The Council refused to concur in this view, and the opinion of the justices of the Supreme Judicial Court was asked. On the 19th of November their opinion was given, of which the essential portions follow:

The statute of 1879, chapter 291, in the second section provides that "the Governor, with the advice and consent of the Council, shall appoint nine persons who shall constitute a State Board of Health, Lunacy, and Charity." The principal question presented to us is whether under this statute it was competent for the Governor, with the advice and consent of the Council, to appoint a woman as a member of such board. There can be no doubt that it is within the constitutional power of the Legislature to provide by a statute, duly passed and approved by the Governor, that women may be appointed members of such board. The question, therefore, is one merely of the construction of the statute and of the intention of the Legislature. The word "persons" in its natural and usual signification includes women as well as men. Throughout our statutes, and particularly in those relating to the punishment of crimes, it is constantly used in a sense which necessarily includes both sexes. In other parts of the statute we are considering the word is used in a sense which clearly includes women. The decision of the Court in Robinson's case, reported in 181 Mass., 376, does not, in our judgment, conflict with this construction. That decision was that under the statute of 1876, chapter 197, which provides that a citizen of this State of the age of twenty-one years and of good moral character may be admitted to practice as an attorney, an unmarried woman was not entitled to be so admitted. Then the only question was as to the construction of the statute of 1876 and the intention of the Legislature expressed therein. The Court considered that by the common law, and the unbroken usage of this Commonwealth under it, women were not compe-

tent to act as attorneys-at-law; that although the word "citizen," used in its most common and comprehensive sense, included women, yet the Legislature in the statute under consideration was not presumed to intend to use it as including women, because such construction would reverse the policy of its predecessors and introduce a fundamental change in long-established principles of law. These considerations, which were controlling in that case, have no application to the question before us. The statute of 1879 does not, upon the construction we give it, introduce any new policy or make any change in established principles of law. On the contrary, it is in accordance with the policy established by former legislation.

We are of opinion that, under the provisions of the second section of chapter 291 of the acts of 1879, it was competent for the Governor, with the advice and consent of the Council, to appoint a woman as a member of the State "Board of Health, Lunacy, and Charity." This being so, the effect of the first section of chapter 79 of the Public Statutes undoubtedly was to confirm and continue in office the members of the board during the terms for which they were appointed.

Party Conventions.—The Republican State Convention met in Worcester on the 19th of September, and nominated the following ticket: For Governor, George D. Robinson; Lieutenant-Governor, Oliver Ames; Secretary of State, Henry B. Pierce; Treasurer, Daniel A. Gleason; Attorney-General, Edgar J. Sherman; Auditor, Charles R. Ladd.

The Prohibitory State Convention met in Boston on the 20th of September, and nominated the following ticket: For Governor, Charles Almy, of New Bedford; Lieutenant-Governor, John Blackmer, of Springfield; Secretary of State, Solomon F. Root, of Barre; Treasurer and Receiver-General, Thomas J. Lothrop, of Taunton; Auditor, Jonathan Buck, of Gloucester; Attorney-General, Samuel M. Fairfield, of Malden.

The Democratic State Convention met in Springfield on the 25th of September, and nominated the following ticket: For Governor, Benjamin F. Butler, of Lowell; Lieutenant-Governor, Frederick O. Prince, of Boston; Secretary of State, Charles Marsh, of Springfield; Auditor, John Hopkins, of Millbury; Treasurer, O. H. Ingalls, of North Adams; Attorney-General, J. W. Cummings, of Fall river.

Mr. Prince declined, as did also Samuel A. B. Abbott, of Boston, substituted by the State Committee, which finally placed James S. Grinnell, of Springfield, in nomination.

On the same day the Greenback-Labor party held its State Convention in Boston, and nominated the following ticket: For Governor, Benjamin F. Butler; for Lieutenant-Governor, John Howes, of Worcester; for Secretary of State, Nicholas Furlong, of Boston; for Treasurer and Receiver-General, Wilbur F. Whitney, of Ashburnham; for Auditor, A. H. Wood, of Lunenburg; for Attorney-General, George Foster, of Lynn.

N. S. Cushing, of Middleboro', was afterward substituted for Mr. Howes, and Hiram W. K. Eastman, of Lawrence, for Mr. Whitney.

Election Returns.—At the election in November, the Republican ticket received a majority. The following is the vote for Governor: George

D. Robinson, of Chicopee, 160,092; Benjamin F. Butler, of Lowell, 150,228; Charles Almy, of New Bedford, 1,881.

Of the 8 members of the Executive Council, 5 are Republicans and 3 are Democrats.

In the Senate there are 25 Republicans, 14 Democrats, and 1 Independent Democrat.

In the House there are 137 Republicans, 92 Democrats, 8 Greenbackers, 6 Independents, 1 Independent Republican, and 1 Independent Democrat.

METALLURGY. Iron and Steel.—A new continuous direct process for the dephosphorization of iron in a charcoal-furnace is described by Prof. Särnström as having been experimentally tried at Nyhammar, in Sweden, with satisfactory results. The old Osmund or Catalan process, formerly used in Sweden to produce excellent iron, was intermittent and expensive, involving a large waste of fuel, and had to give way to blast processes. These, being adapted only to ores weak in phosphorus, precluded the use of a large proportion of the magnetic ores of Sweden. It is clear that if the process of conversion takes place in a shaft, as in a blast-furnace, without the temperature becoming so great as to effect any coalescence or complete smelting, and the mass is, at this stage, transferred in a convenient manner to a hearth where the further process of fusing the iron particles can take place, the process will at once become continuous and direct, and will have the advantages of saving fuel and removing impurities in the bloom at the same time. The furnace can be kept closed during the operation, so that the reduction by hot carbonic oxide may proceed continuously. The furnace at Nyhammar consists of a reduction-shaft connected with the hearths by small culverts. These hearths can be closed, having heavy dampers so balanced as to be easily raised and lowered, with holes in their lower part, by which the gases generated by the fuel may pass through the shaft and thus act the part of gas in an ordinary blast-furnace. Charcoal and iron are charged in the shaft of the furnace in proper proportions. The ore will then, as it settles in the shaft, be subjected to the same process of conversion as in the ordinary reduction-zone of a blast-furnace. When it is desired to transfer the spongy iron to another hearth, the raking-down, which is kept up for the purpose of having the furnace always well filled with charcoal and iron until the smelting is nearly effected, is stopped; a hook is passed through the upper holes of the dampers of the culvert through which the raking-down is performed, and the bloom is allowed to go down into the hearth. It may then be easily broken up when one of the dampers is opened. One fire-place should always be kept charged during the operation, so as to maintain a gas pressure in the furnace constantly higher than the pressure of air from without, in order to prevent all suction of air through the open hearth. As soon

as the bloom is removed and the hearth is cleaned out, it is again closed and refilled with charcoal and iron, by raking down from the shaft as before, and the blast is turned on. In the same way, the process may be alternated with the other hearths. A considerable advantage to the practical utility of this furnace is the great ease with which the raking-down, or any other operation which may be required in the hearth while the blast is on, is effected. With a little practice, which an unskilled laborer may acquire in a very short time, it is possible to charge and rake charcoal and ores uniformly down, an advantage embodying a check whereby, to a certain extent, the action in the furnace may be kept perfectly even. The heat thrown out by the furnace was small, and the work of operating it was so simple as to render the managers comparatively independent of skilled workmen. In most of the experiments two barrels, or 12·6 cubic feet, of charcoal to 8 cwt. of ore were used; but toward the finish, the quantity of ore was reduced to 2 cwt. When tested, the iron made by this process did not show any tendency to red-shortness or brittleness; its elasticity was satisfactory and compared well with that of the class of pig-iron made by the Lancashire process. The process is well adapted to resmelting by the Martin process. According to Prof. Särnström's estimates, 15 tons of good merchant iron, containing an average of 0·08 of phosphorus, were made by it from 27 tons of ore containing 0·91 of phosphorus, with an expenditure of about 600 barrels of charcoal and a loss of iron amounting to less than 5 per cent.

In Bull's direct process, no solid carbon is used in the furnace. The charge is made with iron-ore and flux—usually limestone—only, while the furnace is worked exclusively with gas, which is delivered to it in a very highly heated state direct from the producers. Highly heated air is also introduced in sufficient quantities to burn about 10 per cent. of the gas and maintain the furnace at the high temperature necessary to allow the withdrawal of the iron or steel and cinder in a fluid state. The gases rising through the ore and flux under this system are carbonic oxide and hydrogen in equal volumes, together with the nitrogen derived from the air which has been blown into the furnace. These gases being produced entirely outside of the furnace, there is no zone of gasification within it, but only the zones of fusion, reduction, and carbonization have to be provided for. The zone of preparation, in which the ore, fuel, and flux are freed from their moisture and the temperature of the ore is raised to the reduction-point, is also removed from the furnace to a special apparatus. Experiments in the operation of this system were made by the Société John Cockerill at Seraing, Belgium, in 1881. With an ordinary blast-furnace six feet in diameter at the base, and twenty-one feet high, it was found possible to reduce the silicon in the product from 8·40 to

·15; the sulphur from 1·61 to ·88; the phosphorus from 1·76 to 1·10; the manganese to *nil*; the combined carbon to ·52; and the graphite to ·17. At the same time, the output from the furnace was increased enormously, and the quantity of fuel required was decreased in a corresponding ratio. Mr. Bull has not yet erected his furnace on a commercial scale, but is awaiting the perfection of improvements in his calcining oven for heating the ore and flux, and in the air-heating stoves and gas-producers. He is confident, however, that with the enormous increase of the output of the furnace and the great reduction in the amount of fuel consumed, which he has demonstrated, iron or steel ingots can be produced by his system in any district at a cost much lower than the most inferior pig-iron under the present systems.

Lead and Silver.—Mr. Carl Henrich, while smelting at the Benson Smelting Works in Arizona, for lead-silver bullion, had to use as a lead-ore a sulphate of lead (anglesite) with occasional lumps of galena. He had also received for reduction an ore high in silver, carrying about 25 per cent. of iron pyrites, with oxide of iron and quartz or silicates. Finding the old method of reducing anglesite to sulphide of lead and then precipitating the lead by metallic iron to be very unsatisfactory, on account of the quantity of silver-bearing matte produced, and the difficulty, amounting almost to an impossibility, of making a slag free from lead, he made the experiment of reducing the anglesite by the action of iron pyrites with silica. Acting upon the calculation that the reducing power of the pyrites would be about five times that of the galena, he found that, by putting together, in round numbers, 350 pounds of the anglesite-ore (estimated to contain 15 per cent. of galena and 75 per cent. of anglesite) with 100 pounds of the silver-ore carrying iron pyrites, the two ores would reduce each other and the sulphur would be removed in the form of sulphurous acid (SO₂), with the production of very little matte.

Copper.—Heap-roasting of copper-bearing pyrites has been practiced at nine different mines lying along the ore belt from North Alabama to Central Vermont, but can be said to have entirely succeeded only at two neighboring mines lying in Central Vermont. The bed upon which the ore is roasted, having to be well drained, is constructed precisely like the traffic-way of a city street. The plan of the heap is laid off in the form of a parallelogram, 24 feet wide and 50 feet long, and wood—common split fuel-wood is the best—is piled nine inches deep all over the plan. The ore is piled upon this and carefully arranged in successive layers till a bed seven feet thick is formed. One foot of "ragging," or the coarser part of ore that has passed through a screen of holes 1½ inch in diameter, is laid over this, and the fire is started. As soon as the ore has ignited, from the ground one foot upward, "fines," or that part of the ore which has passed through a screen

with meshes of one third of an inch, are shoveled on the heap and constantly added, so as to keep the temperature of the outside nearly endurable to the hand. In about ten days, no part of the heap having been allowed to fuse, no more attention will be needed; and in about eleven weeks the mass will be ready to remove to the furnace. If the operation has been successfully performed, out of 850 short tons of ore put in the heap, not more than twenty tons will require any further roasting. At the Ely mine, Vershire, Vt., and the Elizabeth mine, Strafford, Vt., the entire heaps are smelted, and none of the ore requires re-roasting.

The Doetsch process for the extraction of copper has been tested on a large scale by the Rio Tinto company for several years. Its essential features are as follow: The raw ore, broken to a uniform size of about 0.4 of an inch, is piled in heaps from ten to thirteen feet high, in which channels are left along the bottom and vertical draught-holes are provided for. About two per cent. of salt is scattered over the top of the pile, which is about 45 feet wide. A basin for the leaching fluid, about thirty feet square, is formed on the top of the pile, into which the solution obtained after the precipitation of the copper, subsequently saturated with chlorine, is allowed to flow. Trickling through the ore, the solution acts upon the copper, and is gathered in gutters, conducted to tanks, and made to flow through long sluices, where the copper is precipitated with metallic iron. The precipitate is dried on hot iron plates, and the solution, after precipitation, is dropped through a coke-tower, where it is met by an ascending current of a mixture of chlorine and hydrochloric acid.

Experiments begun at Védènes in 1880 for applying the Bessemer process to the reduction of copper were unsuccessful as long as the ordinary Bessemer converter, with its vertical tuyeres, was used, on account of the premature cooling of the copper before the iron and sulphur were entirely eliminated. Horizontal tuyeres having been substituted for vertical ones, so that the blast was forced into the bath at a point above the bottom of the converter, the results were at once improved, and it was found very easy to convert copper matte rapidly into blister-copper containing only from one to one and a half per cent. of foreign substances. The process has been carried out on a working scale in the old Royal foundry at Egnilles, near Sorgues. The operation does not differ essentially from that in the Bessemer steel converter. When the matte treated is very poor, casting must be proceeded with at once, otherwise a violent reaction is liable to take place, but with rich mattes it goes on without any difficulty. Arsenic and antimony are eliminated; cobalt is partly scorified and partly remains with the copper; and nickel and bismuth are both concentrated in the product. The copper obtained

has a very constant composition, varying as follows: Copper, from 98.05 to 98.08; sulphur, from .09 to .08; and iron, from .06 to .04.

Nickel.—Mr. William P. Blake, in a paper read before the American Institute of Mining Engineers at Boston, recounts some of the advances in the metallurgy of nickel that have been made in this country. For some time after its discovery by Cronstedt in 1751, nickel received no applications, and remained comparatively unknown. Inasmuch as nickel first became known in the industrial arts in an alloy, there were no special attempts to produce the metal in a state of extreme purity. The nickel silver of commerce answered all the existing demands, and was of course much easier to make, and cheaper than the pure nickel. It found a large use as a substitute for silverware, especially when the new art of electroplating was developed, and is to this day the most desirable alloy for plating. The use of nickel alloy for small or subsidiary coins next made an increased demand for nickel. Tentative efforts were made by Dr. Feuchtwanger, in New York, in the year 1837, and he actually issued many small one-cent and three-cent pieces, made of a nickel alloy. Switzerland commenced using nickel-alloy coins in 1850; the United States in 1857, though sample coins, one-cent pieces, had been made by Prof. James C. Booth at Philadelphia in 1853. Nickel-ore is more generally distributed throughout the mineral-bearing portions of the United States than is generally supposed. It is commonly associated with chrome-ores from Canada to Maryland, and equally with the chrome-ores of the Pacific slope. The chief supply of nickel for the United States has been obtained from Lancaster Gap, Pa. This locality was worked some thirty years ago by Prof. James C. Booth and others. About ten years later Mr. Joseph Wharton purchased the works, and established the industry at Camden, N. J., where it has since been carried forward. But Mr. Wharton, not being content with the production of impure nickel, early commenced experimenting to determine whether nickel could not be produced in a pure and malleable condition, susceptible of being worked in nearly the same manner as iron. In 1878 Mr. Wharton sent to the Vienna Exhibition a sample of nickel in the form of axles and axle-bearings, and at the exhibition in Philadelphia in 1876 he exhibited a remarkable series of objects made of *wrought nickel*. The judges reported the exhibit to the commission as worthy of an award in the following terms: "A fine collection of nickel ores from Lancaster county, Pa., with nickel-matte, metallic nickel in grains and cubes, and manufactured nickel, both cast and wrought; nickel magnets and magnetic needles, cast cobalt, electro-plating with nickel and cobalt, and salts and oxides of both these metals; the whole showing a remarkable degree of progress in their metallurgical treatment."

Dr. Fleitmann, of Iserlohn, Westphalia, has

improved and cheapened the operation of refining the nickel and toughening it, and has reduced the liability to the presence of blow-holes in castings, by adding to the molten charge when ready to pour a very small quantity of magnesium. Dr. Fleitmann has also succeeded in welding sheet-nickel upon iron and upon steel plates, so as to coat them equally on each face with a layer of nickel. He claims to have produced steel wire similarly coated, and proposes to make nickeled boiler-plates. Up to this time the most direct uses of such nickeled-iron sheets seem to be in making hollow-ware, particularly culinary vessels, and the manufacture has already begun at Schwerte by Dr. Fleitmann. This ware is believed to be far superior to tinned iron or tinned copper for cooking in. The nickel is not only less liable to corrosion, but is harder, will wear longer, and can not be melted off by overheating. The ware is lighter and stronger than tin or copper ware; is susceptible of a high polish and is not easily tarnished. The coating of nickel applied by welding is stronger and tougher than that deposited by electrolysis, and appears to be less liable to scale off.

The general use of nickel in solid articles has heretofore been impracticable on account of its expensiveness and of its brittleness, making it hard to work. A French company now obtain it from New Caledonia so cheaply as to permit them to use it at half the cost of a few years ago; and they have adopted methods of reduction that enable them to roll and forge it and adapt it to the manufacture of many useful articles. Mixed with zinc, copper, or tin, in such a proportion that 20 per cent. of nickel shall be present, it forms a nickel bronze of a desired color and inoxidable. All articles that are now made of brass or copper and nickel-plated may be made of nickel bronze at practically the same cost, and will be one fifth stronger, and may be as much lighter. Added to steel, nickel increases its hardness, renders it inoxidable, and makes it more suitable for edge-tools.

Pure nickel, after melting and casting, generally holds more or less of oxygen in combination, and is brittle. This has to be remedied by incorporating in the melted metal some substance which has a strong affinity for oxygen, and also for the nickel itself. M. J. Garnier has found that phosphorus answers this purpose very satisfactorily, and that it produces effects analogous to those of carbon in iron. If the phosphorus does not exceed three tenths of one per cent., the nickel is soft and very malleable; with more than that proportion, the hardness increases at the expense of the malleability. Phosphorized nickel, when alloyed with copper, zinc, or iron, gives results which are far superior to those that are obtained from the same nickel when not phosphorized. By means of the phosphorus, Garnier has been able to alloy nickel and iron in all proportions, and always to obtain soft and malleable prod-

ucts. The contradictions of chemists, some of whom say that such alloys are brittle, and others that they are malleable, are thus explained by supposing the results to have varied according as the iron contained or did not contain phosphorus.

Tin.—A bed of tin-ore has been discovered in Pennington county, Dakota, in the central part of the Black hills, on a mountain rising about 4,300 feet above the sea, which has been named the Tin mountain. The cassiterite occurs near the top of the mountain, in two distinct forms—a massive form, in close association with spodumene, feldspar, and quartz; and in a granular form, disseminated in a massive micaceous albitic rock or greisen, which traverses the coarse granite in irregular veins. The outcrops or exposures of the ore at the surface are "extensive and decidedly encouraging"; and the percentage of ores to mineral compares favorably with the percentage of tin-stone in the ores of other and well-known tin regions, ordinary hand-samples of the greisen, rejecting the richer portions, having yielded from 6 to 10 per cent. of clean tin-stone, or black tin, of high grade.

Quicksilver.—The quicksilver-mines of the Amiata mountain, in the province of Siena, Tuscany, have undergone an extensive development in late years. The ore, the sulphuret, or cinnabar, is found in the valley of the Siele in an argillaceous lode in the forms both of almost invisible particles and of very rich red masses, sometimes of large size. Two shafts have been sunk, one 170 metres (or 552 feet), and the other 57 metres (or 185 feet) deep, with horizontal workings cutting the lode at three different heights. The ore, having been brought to the surface, is separated from the stone and is also sorted into two different classes, rich and poor, by a screen. It is then run down a self-acting incline, in trucks, to the works, and is reduced by women into small pieces, which are kept as dry as possible. The works are furnished with twelve half-moon retorts of cast-iron for treating the rich ore, and three vertical furnaces for the poor ore. The retorts are arranged horizontally, three by three in four ovens, their mouths being closed by covers luted with clay and kept in place by screws and straps. They are charged, each with from two to two and a half hundred-weight of ore and quicklime, in the proportion of one of the latter to eight of the former, every eight hours, the operation being performed very quickly and the closing effected immediately, to prevent loss of metal, and injury to the men's health from the escaping vapors, for distillation begins at once. The distilled mercury escapes by the neck of the retort, and passes into a receiver, in which cold water is constantly circulating. The vapors from six retorts are condensed in one and the same tank filled with cold water, and the metallic mercury is drawn off from inclined channels at the bottom. This treatment is

given only to the rich ore. The furnaces in which the poor ore is treated are thirteen feet high and three feet three inches in diameter. Each furnace is closed at the top by a hopper with two doors, the upper of which has a water-joint. Twelve charges are made each day, and care is taken to open the upper door as little as possible. The charge consists of two hundred-weight of ore, mixed with a quarter the quantity of charcoal. It is lowered into the furnace by opening the lower door, while the upper door is closed; and a fire is kept burning at the upper part of the furnace to prevent the escape of the gases. The mercurial vapors and gases of combustion are led by a chimney into condensing chambers. From 150 to 160 tons of ore are extracted at the Siele mines every month about 22 tons of metallic quicksilver; and this is packed in about 800 cans with screw stoppers.

Aluminum.—The only establishment at which aluminum is regularly manufactured is at Salindres, where about 2,400 kilometres are produced annually. The metal is prepared by melting the double chloride of aluminum and sodium with sodium and some cryolite as a flux. The new method of obtaining the metal from bauxite, proposed by Mr. Webster, does not promise to be as successful in cheapening its cost as its author hoped it would be. Mr. Webster has suggested a process of preparation of alumina, for the purpose of manufacturing aluminum, by heating alum with coal-pitch; subjecting the resultant mass, broken to pieces, to the action of hydrochloric acid, for the elimination of sulphureted hydrogen; adding 5 per cent. of charcoal-powder or lamp-black, with enough water to make a thick mass; drying the mass made up into balls, and heating the balls to a red heat for three hours under exposure to air and the vapor of water, for the conversion of sulphur and carbon into sulphur dioxide and carbon dioxide, and the removal of impurities. The dry residue, which consists of aluminum oxide and potassium sulphate, is cooled and ground to a fine powder. The powder is then treated with about seven times its weight of water and boiled for about an hour. The solution containing potassium sulphate is then run off and evaporated to dryness, and the alumina is washed out and dried. Mr. J. Morris, of Uddington, near Glasgow, claims to obtain aluminum by treating an intimate mixture of alumina and charcoal with carbon dioxide. For this purpose a solution of aluminum chloride is mixed with powdered wood, charcoal, and lamp-black, and then evaporated, until it forms a viscous mass, which is shaped into balls. During the evaporation hydrochloric acid is given off. The residue consists of alumina intimately mixed with charcoal. The balls are dried, and then heated with steam in appropriate vessels for the purpose of driving off all the chlorine, care being taken to keep the temperature so high that the steam is not condensed. The temperature is

then raised, so that in the dark the tubes are seen to be at a low red heat, and dry carbon dioxide is passed through. This is said to be reduced by the charcoal to carbon monoxide, which, as affirmed by Mr. Morris, reduces the alumina to aluminum, the metal appearing as a porous, spongy mass.

Precious Metals.—Prof. Chandler Roberts, who is engaged in the study of metals at temperatures above their melting-points, has described some experiments on the mobility of gold and silver in melted lead. If a lump of a gold-lead alloy with 80 per cent. of gold, covered with lead, is heated in a crucible, the gold appears at the surface the very moment when perfect fusion has been attained. The diffusion also takes place rapidly if the gold alloy is put in a small crucible, and this is placed within another crucible containing lead. By melting in a cylinder, 200 millimetres high, a solid cylinder of lead with a small piece of the gold alloy fused to its bottom—or, better still, by placing the gold at the top of one limb of a U-shaped crucible, and withdrawing test portions from the top end of the other limb—Mr. Roberts arrived at the diffusion rate, 800 millimetres in five minutes for gold. Sir William Thomson has characterized this as a great discovery, remarking that the rate of diffusion of gold in lead appeared to be immensely greater than the rate of diffusion of liquids. The subject, he said, is one, in fact, of which we understand very little, but the property will probably prove of great value in metallurgy, where one example of it, the rapid mixture of spiegeleisen with iron, is well known.

Messrs. Blas and Miest have discovered that if, in electrolysis, compressed ores are used as anode in a bath of an electrolyte containing the same metal as the metal of the ore, on the passage of the current the ore is decomposed, the sulphur, etc., being precipitated at the anode, while the metal collects at the cathode. When ores containing several metals are operated on, the precious metals, being most easily precipitated, are thrown down first in the metallic state at the cathode under the action of a moderate current. The final separation of these metals requires very little battery-power; for the mass of metal, when dissolved under the action of the current, generates sufficient heat for the ulterior separation of each metal. The products at the anode are extracted and purified by treatment with carbon bisulphide, and afterward by separate electrolysis.

Alloys.—Mr. Alexander Dick has produced a new copper-zinc alloy, which he calls Delta-metal, and which, it is claimed, exhibits characteristics as essentially superior to brass as those of bronze are to gun-metal. Its advantages are great strength and toughness, and a capacity for being rolled, forged, and drawn. It can be made as hard as mild steel, and when melted is very liquid and capable of producing sound castings of close, fine grain. The color can be varied from that of yellow brass to that

of rich gun-metal. The surface takes a fine polish, and tarnishes less than brass. The metal when cast in sand has a breaking strain of from 21 to 22 tons per square inch. When rolled or forged hot into rods, the breaking strain is 48 tons per square inch; and when drawn into wire of 22 B. W. G., it is of 67 tons per square inch.

Messrs. Cockshott and Jowett, of Bradford, England, have produced an alloy of manganese with phosphorus and tin and copper which possesses superior qualities of tensile strength and durability. The phosphor-manganese-tin may be used in the same manner and in similar proportions as phosphor-tin, though it should be cast at a little higher temperature, but with more satisfactory results. It furnishes a very convenient form of the combination of manganese and phosphorus, which is valuable on account of the facility it affords the brass-founder, by adding a greater or less proportion of copper, etc., to produce bronze of a quality exactly suitable to the purpose for which it is required. The bronze is made in two qualities, both selling at the same price. The first quality is very tough, and suitable for purposes where the castings are required to withstand a great strain, having been tested successfully for a strain of 34,754 pounds per square inch. The second quality is very hard and tough, has a tensile strength of 29,979 pounds per square inch, and is suitable for bearings and the wearing parts of machinery.

METEOROLOGY. An extraordinary lurid glow in the western sky after sunset, and in the eastern sky before sunrise, attracted the attention of the world during November and December, 1883. The light occupied the usual place of the twilight, except that its focus of brilliancy was shifted a little to the southeast, but was much brighter, was of a deeper red, the colors were more varied and turbid, and it rose to a greater height and was longer continued. It also did not appear at the instant of sunset, but a few moments later, after the lapse of an interval of comparative darkness. A description given by an observer in Umballah, India, will give a correct idea of the spectacle as it was seen everywhere. "The sun," he says, "goes down as usual, and it gets nearly dark, and then a bright red and yellow and green and purple blaze comes in the sky, and makes it lighter again." The phenomenon began to excite attention in the eastern part of the United States about the 27th of November, when it appears to have reached its culmination in America and Europe. The western sky was illuminated as if by the light of a great conflagration, and fire-alarms were sounded in many places. The spectacle was remarked on the Pacific coast a week previous to this; in Europe early in November; and at points in the East Indies and the Pacific Ocean in September. The earliest notices of it seem to have been made in the islands of Rodriguez, Mauritius, and the Seychelles on the 28th of

August, in Brazil on the 30th, and on the Gold Coast of Africa on the 1st of September. It was observed at Trinidad, in connection with a "blue sun," on the 2d of September, and at Ongole, India, after the setting of a "green sun," early in the same month. It was usually associated either with a wholly clear sky or with a sky marked only by light, floating, cirrous clouds.

An apparent connection has been traced between the red light and a blue or green coloring of the sun, which was observed in the East Indies and in tropical America early in September. This phenomenon was observed at Panama and Trinidad on the 2d and 8d of that month. At Manila, in the Philippine islands, on the 9th of September, during a light dry mist, the sun appeared green, and diffused over all the bodies it illuminated "a strange and curious greenish hue." Similar colorations were observed at the same time at Colombo, Ceylon, just before sunset, and at Madras, India, where Prof. C. Michie Smith, of the Christian College, remarked the perfectly rayless and bright silvery-white color of the sun on the 9th and its pea-green color on the next day. This was repeated several days afterward. The appearance of a green color in the sun and in parts of the sky, outside of the red glow, was remarked on several occasions in Europe. One observer in England recorded the appearance at sunset of a greenish and white opalescent haze about the point of the sun's departure, that shone as with a light of its own, near the horizon. "The upper part of this pearly mist," he says, "soon assumed a pink color, while the lower part was white, green, and greenish yellow." Another observer described the blue of the sky as changing to green and the green to the ruddy tint, while the sun appeared of a brilliant emerald hue, tingeing every thing with green. Similar phenomena, with variations in detail, were noticed at many places in England and on the Continent, including Berlin, Rome, and Davos Platz, in the high Alps, where the spectacle was very brilliant, and the sun appeared through the day "surrounded by a luminous, slightly opalescent haze, not at all resembling halo or iridescence of vapor."

The red glow and the green sun are regarded as effects of a common cause. The same medium which gives by transmitted light a green color to objects viewed through it will reflect the red rays. In seeking to account for the phenomena, they must be assumed to be due to some peculiar condition of our atmosphere; for if the glow had been produced by any cause outside of the atmosphere, it would have been visible in some form through the night, whereas its duration corresponded tolerably closely with that of ordinary twilight; and the cause must have been co-extensive with the atmosphere, for the glow lasted as long as a twilight, and even longer. The manifestation was not auroral or electrical, for no

auroras were seen that could reasonably be associated with it, and no electrical disturbances were mentioned in connection with it, except in a single instance by Prof. C. Michie Smith, of Madras. The theory that it is the result of peculiar conditions of vapor in the air receives a partial support from Prof. Smith's spectroscopic observations, in which all the atmospheric lines usually ascribed to aqueous vapor were very strongly developed. A marked general absorption was also observed in the red. The facts may also be cited in favor of this theory, that Prof. Lockyer has seen the sun green through the steam of a steamboat; that it has appeared green through the mists of the Simplon; that bright-green suns have been remarked by travelers in the Arctic regions; and, as stated by the Rev. G. H. Hopkins, of Cornwall, England, that, in a clear sky, when the disk of the sun sinks below the horizontal line of the ocean, the parting ray is a bright emerald-green. It is, however, difficult, on this theory alone, to account for the persistence of the phenomena for so long a period through all the varying conditions of atmospheric pressure. Dr. F. A. Forel, of Morges, Switzerland, mentions, as against the sufficiency of the hypothesis, that in Switzerland the glow, after having decreased subsequently to the 3d of December, attained a second maximum on the 24th and 25th of that month, when the atmospheric conditions were quite different from those which prevailed in the country at the time of the first maximum.

The hypothesis that the spectacle was caused by the presence in the atmosphere of a cloud of "cosmic dust," which the earth had met in its course, has received considerable support. It is now believed, on the authority of Prof. Nordenskiöld, who has collected and analyzed a meteoric dust from the snows of uninhabited regions, and of other observers, that the earth is constantly receiving accretions from space of an exceedingly fine matter having a composition like that of meteoric stones. Mr. W. Mattieu Williams, of London, and M. Émile Yung, of Geneva, collected in December unusually large proportions of such a dust from freshly fallen snows—the former in his garden, the latter on the steeple of the cathedral of Saint Pierre at "les Treizo-Arbres," Mont Salève.

The theory which has found most general acceptance is, that the phenomena have been produced by the diffusion through the whole atmosphere of the earth of ashes and cinders from the eruption of the volcano of Krakatoa, in the straits of Sunda, which took place on the 26th of August. The most weighty objections to this theory arise out of the difficulty of explaining how the matter ejected from the volcano could have so quickly reached the enormous height at which the source of the glow was certainly situated, and of the difficulty of imagining it to remain suspended in the air for so long a time. The eruption from

Krakatoa, which immensely exceeded in violence any convulsion of the kind known to man, may, however, easily be conceived to have been capable of producing effects far transcending those which could be imagined in connection with any ordinary or with any other extraordinary known eruption. Mr. W. J. Stillman has witnessed explosions of the submarine volcano of Santorin that threw masses of rock weighing many tons to a distance of from half a mile to a mile, and clouds of dust to an elevation of from six thousand to ten thousand feet. Such effects, magnified to correspond with the grander scale of the Krakatoa eruption, might furnish the conditions required. Respecting the second difficulty, Mr. W. H. Preece and Dr. William Crookes have shown that finely divided particles of dust having an electrical charge of the same sign as that of the earth, may be kept suspended in the air for an indefinite time by electrical repulsion. Prof. S. P. Langley has described an ocean of dust of this kind which he observed in 1881 from near the summit of Mount Whitney, occupying a stratum of the atmosphere some six or seven thousand feet above the level of the sea, from which light was reflected red. A similar formation has been seen from the Peak of Teneriffe, constituting apparently a permanent constituent of the atmosphere.

Positive evidence is at hand of the presence during the prevalence of red sunsets of a dust of this kind in the atmosphere of Europe. The sediment derived from a snow that fell at Madrid, Spain, on the 7th of December, when examined, was found to contain, besides the ordinary atmospheric dust of the city, particles of volcanic hypersthene, magnetic iron, and volcanic glass. A rain that fell at Wageningen, Holland, on the 18th of December, left very obvious sediments, which, when analyzed by Messrs. Beyerinck and Van Dam, of the Agricultural Laboratory at that place, were found to correspond very closely with ashes brought from Batavia, Java, which were known to have come from Krakatoa; similar sediments were found at Worcester, England, and Storlvdal, Norway, on Nov. 17th, and at Gainsborough and York, England, Dec. 12th.

According to Capt. Sir O. Fleming Stenhouse, who was there at the time, the eruption of Graham's island, in the Mediterranean, in 1831, was followed by a series of red sunsets at Malta. White, in his "Natural History of Selborne," records the prevalence in 1783, from June 23d to July 20th, of a peculiar haze, or smoky fog, during which "the sun at noon looked as black as a clouded moon, and shed a rust-colored, ferruginous light on the ground and floors of rooms, but was particularly lurid and blood-colored at rising and setting." All this while, "Calabria and part of the isle of Sicily were torn and convulsed with earthquakes; and about that juncture a volcano sprang out of the sea on

the coast of Norway." The same phenomenon is alluded to in Cowper's "Task"; and it is ascribed in Mrs. Somerville's "Physical Geography" to the eruption of the volcano Skaptar, in Iceland, which occurred May 8th. The sun was observed of a blue color in England in April, 1821, after an eruption in the island of Bourbon. Dr. Budde, of Constantinople, was told in Algeria, in 1880, that the sun has a decidedly blue color when seen through the fine dust of the desert. Mr. Edward Whympier has described the green suns and ruddy sky effects through a cloud of volcanic dust from Cotopaxi in language precisely applicable to the phenomena under consideration.

Extremely brilliant colorations of the sky have been often mentioned in connection with a particular tropical belt. Col. Stuart Wortley, who had already remarked the unusual colors of the sunsets during a series of eruptions of Vesuvius, was greatly impressed with the gorgeous coloring of the tropical skies, which only occurs in certain latitudes and in well-defined belts, and suggests that it may be the result of a constant stream of volcanic matter thrown out by the great volcanoes in the mountain-ranges of South America and elsewhere, forming an almost permanent stratum. In connection with this supposition may be noticed the interesting coincidence, mentioned by Mr. Lockyer, that the volcanic ashes were in the present case, even before they reached India, taken by an upper current from the east, "in a straight line *via* the Seychelles, Cape Coast Castle, Trinidad, and Panama, to Honolulu—in fact, nearly back again to the straits of Sunda."

It is possible to combine the theory that ascribes the phenomena to aqueous vapor with that which attributes them to volcanic or meteoric dust, by supposing that the dust may act as a nucleus for the condensation of any vapor that may exist at its level, as ordinary city dust and smoke have been found to act as the nucleus for fogs.

Annual Rainfall in the United States.—Lieut. H. C. Dunwoody has compiled, under the direction of the Signal Service of the United States, a series of tables with accompanying charts, showing the geographical distribution of the average monthly and the average yearly rainfall at different points in the country, as determined from observations regularly taken at the Signal-Service stations and army posts, from the establishment of the Meteorological Bureau of the Signal Service, in 1870, to January, 1881. The accompanying map shows the general result of the observations by indicating the average annual precipitation throughout the United States during the ten years over which they have extended. The region of heaviest precipitation appears from it to be a narrow strip along the coast of Washington Territory, where alone more than 80 inches of rain fall during the year. The regions of the next heaviest rainfall, between 70 and 80 inches annually, are a narrow strip back of this one, a small section

on the eastern coast of Florida, and another small district south of Cape Hatteras. The most extensive district of the next heaviest annual precipitation, from 60 to 70 inches, is around the northeastern borders of the Gulf of Mexico, in southeastern Louisiana, southern Mississippi and Alabama, and western Florida; while narrower regions of equal precipitation are found in western Washington and Oregon and northwestern California, eastern Florida, and eastern North and South Carolina. In the mass of the Southern States south of North Carolina and Kentucky and east of the Indian Territory and Texas, the mean annual rainfall is between 50 and 60 inches. This region is surrounded on the north and west by two belts, the more remote and more arid one of which is the wider, which together include the bulk of the States north of 36° 30', and east of the Mississippi river, most of Iowa, Missouri, and Arkansas, and eastern Kansas, Indian Territory, and Texas, in which the amounts of annual precipitation are respectively from 40 to 50 inches and from 80 to 40 inches. West of the western edge of the latter zone is a comparatively narrow region in which the rainfall is between 20 and 30 inches annually; while west of this is a broad region, reaching over the Rocky mountains, and to the Columbia river in the Northwest, in which the mean annual precipitation is between 10 and 20 inches. The rainfall begins at the Columbia river again to increase, in narrow belts, toward the west, till it reaches its culmination in the region of greatest precipitation, already mentioned, on the Pacific coast. The most arid regions in the United States are in Nevada and Arizona, and a district in southeastern New Mexico, where the mean annual precipitation does not amount to ten inches.

METHODISTS. I. Methodist Episcopal Church.—

The summary of the statistics of this Church, as they are given in the "Minutes of the Annual Conferences" for 1883, is as follows:

Number of annual conferences.....	39
Number of mission districts.....	14
Number of bishops.....	19
Number of presiding elders.....	477
Number of itinerant preachers.....	12,638
Number of local preachers.....	12,258
Number of members in full connection..	1,601,072
Number of members on probation.....	168,462

Total of members and probationers.....	1,769,534
Number of baptisms during the year of children..	53,378
Number of baptisms during the year of adults...	61,829
Number of churches.....	18,741
Number of parsonages.....	6,307
Value of churches.....	\$60,422,278
Value of parsonages.....	\$9,815,509
Number of Sunday-schools.....	82,508
Number of officers and teachers in Sunday-schools.	241,561
Number of Sunday-school scholars.....	1,601,060

COLLECTIONS AND BENEVOLENT CONTRIBUTIONS.

For ministerial support.....	\$7,283,903
For incidental expenses of churches and Sunday-schools.....	2,028,185
For general missionary work.....	745,107
For Board of Church Extension.....	120,493
For Tract Society.....	13,350
For Sunday-School Union.....	16,233
For Board of Education.....	64,900
For Freedmen's Aid Society.....	66,444
For American Bible Society.....	27,260

The number of members in full connection was 28,895 greater, and the number of "probationers" was 7,882 less, than in 1882.

The agents of the Eastern Book Concern (New York city) reported to the Book Committee that the establishment, at the end of 1883, possessed a capital, clear of all obligations, of \$1,202,598, and that the profits for the year had been \$77,169. The agents of the Western Book Concern (at Cincinnati) returned a net capital of \$412,288, the gain during the year having been \$45,775.

The General Committee of Church Extension met in the city of New York, November 15th. The treasurer of the board reported that the sum of \$383,879 had been available for use during the year, and the disbursements had been \$229,284. The receipts for the year showed an increase of \$18,217 on the general account, and of \$25,504 on account of the loan fund. The board had aided, by loan or gift, or both, 442 churches, and had applications on file, which were granted on conditions, from 240 churches, and other applications from 29 churches. If all these applications were granted, there would still be a balance in the treasury of \$914. On the special appeal for means to aid in the erection of 400 churches on the frontiers, 185 churches had been provided for. The committee decided to ask the churches for contributions during 1884 of \$159,550.

The receipts of the Freedmen's Aid Society for the year 1883 were \$118,153, or \$18,761 more than the receipts of the previous year. The pupils taught in the schools of the society are enumerated and classified as follow: Biblical students, 304; medical, 51; collegiate, 145; academic, 410; normal, 1,887; intermediate, 767; primary, 478—total, 8,537. The schools include seven chartered colleges, three of which have theological departments, one biblical institute, one medical college, and fourteen seminaries, academies, and normal schools not chartered. In accordance with the action of the General Conference of 1880, the society is aiding in the establishment of schools for white pupils in the South. A college has been founded in Little Rock, Ark., another is to be opened at Chattanooga, Tenn., and several academies have been aided. During sixteen years, 80,000 pupils have been instructed in the schools of the society, 950,000 children have been taught by its teachers and its pupils who have become teachers, and \$450,000 have been expended by it in school property.

The General Missionary Committee of the Methodist Episcopal Church met in New York city, November 7th. The treasurer of the Missionary Society reported that its receipts for the year had been \$751,469, and its expenditures \$794,506. The indebtedness of the society had been reduced from \$102,579, in 1882, to \$88,198. Appropriations were made for missions during the ensuing year as follow:

1. Foreign Missions:	
Africa (Liberia).....	\$4,000
South America (Buenos Ayres, Montevideo, etc.).....	22,781
China.....	51,990
Germany and Switzerland.....	24,000
Denmark.....	10,000
Norway.....	14,845
Sweden.....	22,032
India.....	66,820
Bulgaria and Turkey.....	15,452
Italy.....	39,750
Mexico.....	24,000
Japan.....	85,648
Total foreign missions.....	\$370,589
2. Missions in the United States and Territories to be administered as Foreign Missions (including missions in Arizona, the Black Hills, Dakota, the Indian Territory, Montana, Utah, and West Nebraska).....	
	\$63,490
3. Domestic Missions:	
Welsh and Scandinavian.....	\$25,500
German.....	48,109
French.....	12,500
American Indian.....	6,700
English-speaking.....	172,000
Total appropriations for foreign and American missions.....	\$700,188

II. American Wesleyan Connection.—The General Conference of the American Wesleyan Connection met at Syracuse, N. Y., October 18th. The book agent represented the aggregate amount of the assets of the Publishing House, including the building in Syracuse, as \$45,975. The circulation of the literature of the Connection had increased with great regularity during the preceding four years. The educational institutions had quadrupled. The work of domestic missions had been prosecuted with so much success that two additional conferences had been formed as results of it. Resolutions were adopted declaring the Connection to be historically and traditionally, by its standard authors and doctrinal precepts, committed to the work and experience of holiness—"including in holiness both justification and regeneration, and, subsequent to their reception, entire sanctification"; rejoicing over the progress that had been made in the doctrine, and enjoining upon the ministers faithfully to present it before their people. A rule was adopted forbidding the division of any annual conference, on the ground of color or nationality, in any case where all the parties speak the same language. An effort was made for the enactment of a rule forbidding the use of instrumental music in worship, but it failed, and the Conference decided to retain the present disciplinary provisions on the subject. The previous General Conference had refused to receive a delegate who had been appointed in behalf of the General Conference of the Methodist Episcopal Church as its fraternal representative, on the ground that he was a member of a secret order, a fact that constitutes disqualification for membership in the Wesleyan Connection. A similar question was presented on the present occasion, when the General Conference refused to recognize a delegate from the local annual conference of the Methodist Episcopal Church who declared himself a member of two secret societies. A

statement was adopted by the Conference, setting forth that in view of the denominational position on the subject of secret societies, it was not consistent to receive fraternal greetings from an adhering member of an organization of that character.

III. The Methodist Church (Canada).—The following are summaries of the statistics and condition of the several Methodist bodies in Canada which, in September, 1883, consummated a union under the designation of "The Methodist Church":

1. *The Methodist Church of Canada.*—This Church was constituted in its present form in 1874, by a union between the Wesleyan Methodist Church in Canada, the Wesleyan Methodist Church in Eastern British America, and the Methodist New Connection Church in Canada. Its statistics are as follow: Number of ministers and probationers for the ministry, 1,192; of members, 125,420; of adherents, including members, 625,000; of churches, 2,046; of parsonages, 607; value of church property, \$6,022,227; number of Sunday-schools, 1,947, with 18,980 teachers and 180,629 scholars. It has missions among the Indian tribes of Ontario and the French of Quebec, and in British Columbia and Japan, the statistics of which are as follow: Number of domestic or home missions, 392, with 344 missionaries and 30,149 members; of Indian missions, 43, with 27 missionaries, 12 native assistants, 30 teachers, 11 interpreters, and 8,377 members; of French missions, 9, with 9 missionaries, 2 teachers, and 860 members; of foreign missions or stations, 6, with 14 missionaries (seven of whom are native Japanese) and 721 members. Total, 890 missions, with 394 missionaries, 56 other paid agents, and 84,607 members. The income of the society for 1881-'82 was \$159,243. The educational institutions of the Church are Victoria College, Cobourg, Ont.; Mount Allison College, Sackville, N. B., and a seminary for young men and young women at Sackville, N. B.; besides four institutions under the patronage of annual conferences, and one hundred common schools in Newfoundland. The Publishing House at Toronto has assets valued at \$207,531; eight periodicals are published at this house, and one other at Halifax, N. S.

2. *Methodist Episcopal Church in Canada.*—Organized in 1884. It had, previous to the union just consummated, one bishop and three annual conferences. Number of ministers, 275; of local preachers, 270; of churches, 536; of members, 28,070; of Sunday-school scholars, 25,119; value of church property, \$1,372,510; amount of income for home missions, \$12,350. The educational institutions are Albert College, Belleville, Ont., and seminaries for young women at Belleville and St. Thomas. A weekly paper is published at Hamilton.

3. *Primitive Methodist Church in Canada.*—Founded in 1829. Number of ministers, 99; of members, 8,223; of lay preachers, 246; of class leaders, 380; of churches, 237; of parsonages,

48; of Sunday-schools, 169, with 1,253 teachers and 9,843 scholars; value of church property, \$388,853. A weekly paper is issued from the Book-Room in Toronto.

4. *Bible Christian Church in Canada.*—Founded in 1831. The Conference includes ten districts, two of which are in the United States. Number of itinerant ministers, 81; of members, 7,581; of churches, 188; of Sunday-school scholars, 9,878. A weekly paper and a semi-weekly Sunday-school paper are published under the auspices of the denomination.

Union of the Methodist Churches in Canada.—An account was given in the "Annual Cyclopædia" for 1882 of the negotiations between the several Methodist churches in Canada—viz., the Methodist Church of Canada, the Methodist Episcopal Church of Canada, the Primitive Methodist Church in Canada, and the Bible Christian Church in Canada—and the proceedings of their Conferences and General Conferences, with reference to the union of the whole number into a single body, the record being brought down to the close of the year. The provisional basis of union agreed upon by the Conferences demanded the submission of the plan to the Annual Conferences and quarterly meetings for approval. The basis was readily ratified by the Bible Christians and the Primitive Methodists, but met with some opposition in the Methodist Church of Canada, where, however, it was finally approved in the quarterly meetings and in all the Annual Conferences except one, and was formally ratified at an adjourned meeting of the General Conference held at Belleville, August 29th. The chief objections raised in this body to the plan of union related to the question of the general superintendency and to the anticipation that legal difficulties might arise concerning rights in church property. This was most liable to take place in the case of the property of the Bible Christian Church, the parent church of that body in England having refused to give its consent to the Canadian branch going into the Union. The Canada Conference of the Bible Christians decided, however, to enter the Union notwithstanding this refusal.

The first General Conference of the united body met at Belleville, Ont., September 5th. It was composed of 161 representatives of the Methodist Church, 80 of the Methodist Episcopal Church, 8 of the Primitive Methodist Church, and 9 of the Bible Christian Churches. The Rev. J. A. Williams, D.D., was chosen president of the provisional organization. The president of the Bible Christian Conference explained the position of that church with reference to the movement for union by saying that the Conference had at first taken favorable action on the subject, with the belief that the parent body in England would approve the step. A delegation was accordingly sent to England to obtain the desired permission. The refusal of the Conference to give it was an occasion of surprise, and placed the Canada Conference in

an embarrassing position. It, however, would not imperil the union by delaying another year, as the English body had requested; and it was not probable that the English Conference would make any legal demands against the church property. This property was valued at nearly \$400,000. The subject was referred by the General Conference to a committee, which reported, on the legal aspects of the union, that no doubt existed respecting the status of any body except the Bible Christian Church, and that even in the case of this body, if the English church refused to sanction the action of the Canada Conference, all difficulties might be adjusted by means of an act of Parliament. At a later stage of the proceedings, an address was adopted to be presented to the Bible Christian Conference in England, setting forth the imperative necessities which existed for the union of the Methodist churches in Canada, and asking its sanction to the movement. The Conference then proceeded to the adjustment of the details of the organization of the church and of discipline. The General Conference was constituted to consist of ministerial and lay delegates in equal numbers, upon a ratio of representation of one ministerial delegate to every ten ministers in the Annual Conferences. It shall meet on the first Wednesday in September, 1886, and every four years thereafter. It is prohibited from changing the articles of religion, and from introducing new standards of doctrine contrary to those already existing; from destroying the plan of the itinerant system; from making changes in the general rules of the society except by a "constitutional vote"; and from making any change in the basis of union affecting constitutional questions or the rights and privileges of the ministry and laity, except by a three-fourth majority of the General Conference. Ten Annual Conferences were constituted, viz.: the Manitoba, Nova Scotia, New Brunswick and Prince Edward island, Newfoundland, London, Guelph, Bay of Quinte, Niagara, Toronto, and Montreal Conferences. They shall be composed of ministers and laymen in equal numbers, the lay delegates having the right to be present at all ordinary sessions of the Conference, and to speak and vote on all questions except in the cases of the examination of ministerial character and qualification, the reception and ordination of ministers in full connection, and the granting of the supernumerary relation, on which ministers only will vote. Two general superintendents were constituted, to hold office for the term of eight years, one being elected every four years. It is their function to preside over all the sessions of the General Conference and all standing committees of the same; to preside over the Annual Conferences in alternation with the presidents of the same; and to conduct the ordination services in association with the president of the Annual Conference. The general superintendent was made responsible to the General Conference for all his offi-

cial acts, and was given a general oversight of the church and all its institutions, but was prohibited from interfering with the functions of ministers and other officers of the church in their prescribed duties. The elections for general superintendent resulted in the choice of the Rev. Samuel D. Rice, D. D., for the term of eight years, and the Rev. Albert Carman, D. D., bishop of the Methodist Episcopal Church of Canada, for the term of four years. It was decided that the church should be known by the name of "The Methodist Church." The office of district superintendent was constituted for the supervision of the districts into which the Annual Conferences are divided for convenience of administration. The district superintendent is to be chosen by ballot in the Annual Conferences; his duties are to preside in district meetings and in all district committees, to oversee the temporal and spiritual interests of the Church, "and, with the ministers and preachers, to administer and enforce the discipline on his district, being responsible therefor to his Annual Conference." The General Conference decided "that in view of the division and multiplication of Annual Conferences, and the consequent restricted territory within the bounds of each Annual Conference, we deem it important that provision be made for frequent interchange of ministers between the various conferences as a means of promoting connectional feeling throughout the entire church, and maintaining the itinerancy in its integrity." Provisions were accordingly made for the regulation of transfers. The adjustment of the financial interests of the connection and questions concerning church property received much attention. Provisions were made for participation in the celebration of the centenary of organized Methodism in America, appointed for 1884.

IV. Wesleyan Methodist Church (British).—The following is a "general view" of the statistics of the British and affiliated Conferences of this Church, as tabulated in the "Minutes of Conference" for 1883:

	Members.	On trial.	Ministers.	On trial.	Supernumeraries.
I. In Great Britain..	407,065	84,899	1,545	91	284
II. In Ireland and Irish missions..	24,884	606	181	16	49
III. In foreign missions	70,747*	5,299	98	98	9
IV. South African Conference	90,789	9,098	285	74	10
V. French Conference	1,856	169	28	..	8
Totals	524,811	49,637	2,182	279	348

Wesleyan Missions.—The total income of the Wesleyan Missionary Society for 1882 was £169,861, of which £185,874 were classed as

* The apparent decrease from the returns of previous years is accounted for by the formation of the South African Conference, the members of which are represented in the next line. The mission districts still in connection with the British Conference show an increase of 457.

ordinary receipts, while the rest came in the form of special funds. Furthermore, £126,000 had been raised on the mission stations toward their own support. The expenditures were £169,861. The society had paid off a heavy debt which rested upon it, and was now free. The following is the "General Summary" of the missions under the immediate direction of the Wesleyan Missionary Committee and British Conference in Europe, India, China, South and West Africa, and the West Indies :

Central or principal stations, called circuits.....	469
Chapels and other preaching-places, in connection with the above-mentioned central or principal stations, as far as ascertained.....	2,517
Missionaries and assistant missionaries, including supernumeraries.....	596
Other paid agents, as catechists, interpreters, day-school teachers, etc.....	2,059
Unpaid agents, as local preachers, Sabbath-school teachers, etc.....	8,566
Full and accredited church-members.....	91,378
On trial for church-membership.....	14,489
Scholars, deducting those who attend both the day and Sabbath schools.....	108,501
Printing establishments.....	8

A very rapid and remarkable advance of Christianity was represented to be taking place in India and Ceylon. The missions in South Africa had been constituted into the South African Conference, to be under the partial support of the society, while its own missionary efforts proper in that country would be applied to the extension of missions into the Transvaal and Swaziland, with the design of making these efforts the first steps of an advance into Central Africa.

Wesleyan Conference.—The Wesleyan Conference met in its one hundred and fortieth session in Hull, July 24th. The Rev. Thomas McCullough was chosen president. The numerical returns were presented and showed that in the circuits under the immediate jurisdiction of the Conference the number of members was 407,085—a larger number than was ever before reported in the history of the connection—against 393,754 in 1882. The number of new members received was 60,606. The number of persons on trial for church-membership was given at 34,899, or 6,254 less than were returned in 1882. The committee on the thanksgiving fund, while it had not yet closed its accounts, and could only present an *ad interim* balance-sheet, reported that the total amount that had been paid to the General Treasurers up to July, 1883, was £291,721. The Book Committee returned an amount of sales not quite equal to those of the previous year, but "very much above the average," and sufficient to allow all of the customary grants to be made from the profits. Fifty-four new books, sixty-two new editions, and seventy-eight new tracts had been published during the year; and the total issues of the Book-Room had been 1,707,000 copies of publications, and 6,156,263 tracts. The expenditure for home missions had been £34,946, while the income of the fund had been £500 less. Seven lay missionaries were maintained, who had held

more than a thousand services, and returned additions of 400 members to the church. The income of the chapel fund had been £9,369; grants had been made of £3,507, and £688 had been advanced in loans to twenty-five chapels. The sum of £367,238 had been expended during the year on new erections, and in the reduction of debts. Among the new erections were 118 chapels. The report of the Metropolitan Chapel Building fund showed that since its institution, about twenty-one years before, sixty-four chapels, each affording sitting accommodation for at least 1,000 persons, and one hundred smaller chapels, had been erected in the Metropolitan district. The year's income of the fund had been £11,429, while the grants and loans paid out on its account amounted to £6,500. The fund for the extension of Methodism in Scotland returned a capital sum of £9,885. The Committee on Foreign Missions reported that the expenditure of the year had been practically brought within the income, but that the society was in great need of more ample resources.

The Temperance Committee reported that the strength of the temperance societies was increasing very rapidly. The whole number of temperance societies within the connection was now 321, with 23,414 enrolled members, showing an increase during the year of 144 societies and 17,502 members. Besides, there were returned 2,644 Bands of Hope, with 46,549 members. A petition in favor of the Sunday-closing of all the places where intoxicating liquors are sold in England had been prepared under the direction of the committee and presented to Parliament, to which 596,877 signatures were attached. The Committee on Sunday-schools reported the whole number of Sunday-schools in the connection in Great Britain to be 6,584, with 124,390 officers and teachers, and 841,591 scholars; and that the Sunday-schools were maintained at an annual cost of £71,864. The number of schools connected with the Sunday-School Union was 2,901; and the receipts of that association had been £19,259.

A novel feature in the history of the Conference was a visitation which it received from a deputation of the clergy of the Established Church in Hull. The deputation presented an address, saying that they regarded with gratitude the noble spiritual work which the Wesleyans had been able to accomplish at home and abroad, and that "we readily extend to you and all who uphold the fundamental doctrines of the kingdom of God the right hand of fellowship." A report was made of the organization of the South African Conference, with an account of its first session and its address to the Wesleyan Conference. The new Conference extends over a territory reaching from the Cape of Good Hope to the Vaal river, and includes within the sphere of its operations missions among the Hottentot, Tembu, Baralong, Pondo, and Zulu tribes. The churches

under its jurisdiction were already contributing £45,000 of the £60,000 which it cost to maintain their work during each year. A scheme was adopted for the organization of the connection in the West Indies into two conferences, to be associated in a General Conference which shall meet every three years. In other points the organization of these conferences will be similar to that of the South African Conference. The plan has yet to receive the assent of the West Indian churches. Steps were resolved upon for securing amendments to the marriage laws of England, of such a character as shall put Wesleyan and other ministers on an equality of privilege in solemnizing marriages with the clergy of the Church of England. The plan of amendment approved by the Conference embraces principles similar to those of the Scotch law for registration. It proposes that the present requirement of notice at the registrar's office, and of license, shall be retained; but that the marriage may then be celebrated, on production of the license, by any minister duly authorized for that purpose, in any duly registered place of worship, without the presence of the registrar, which is now required in the case of marriage by dissenters, after which a certificate shall be filed in the registrar's office; and it further stipulates that the total fees for such marriages charged at the registrar's office shall not be greater than the fees charged for an ordinary marriage according to the rites of the Church of England. A report was approved in favor of holding a second Ecumenical Conference of Methodists in 1887.

V. Primitive Methodist Connection.—The following is a summary of the statistics of this Church as they were reported to the Conference in June: Number of members, 196,480; of traveling preachers, 1,147; of local preachers, 15,982; of leaders, 10,994; of connectional chapels, 4,437; of other preaching-places, 1,812; value of trust property, £2,812,268; indebtedness on trust property, £1,087,015; number of Sunday-schools, 4,184, with 61,215 teachers and 400,597 scholars. Income of the Sunday-schools, £60,000. The income of the superannuated preachers', widows', and orphans' fund had been £6,689. The committee of the fund returned 267 annuitants upon its lists. The income of the chapel fund had been £385. Twenty-four chapels had been assisted by grants. Including what the chapels themselves had raised, £5,840 had been spent under the auspices of the fund in the relief of their estates. The Connectional Insurance Company returned a reserve fund of £9,860, carefully invested, with 4,711 outstanding policies. A statement was made in the Conference that the total amount of contributions within the Connection had been during the year: For chapel debts and current chapel expenses, £269,508; for educational purposes, £56,574; for the support of the ministry, £115,200; for various connectional funds, £9,378; for literature sold by the Book-Room, £26,644; for missionary

purposes, £15,768; making in all nearly half a million pounds sterling, or an average of £2 11s. 7d. per member.

The anniversary of the Primitive Methodist Missionary Society was held May 1st. The income of the society for the year was returned at £36,865, derived as follows: From contributions of home stations, £17,222; contributed by foreign stations, £2,888; raised in the missions for schools, churches, and the maintenance of missionaries, £16,760. The whole amount showed an increase of £1,640 over the receipts of the previous year. The work of the society was extended to 238 stations; of which 56 were classed as "home," 178 as "colonial," and 4 as "foreign" stations, and was conducted by 79 "home," 217 "foreign," and 6 "colonial" missionaries and ministers, or 302 missionaries in all.

The sixty-fourth Primitive Methodist Conference met at South Shields, June 13th. The Rev. W. Cutts was chosen president. The business of the Conference had reference chiefly to the condition and interest of the various institutions and benevolent enterprises of the Connection. A Temperance Society was established, with a Band of Hope Union, the pledge including abstinence from tobacco and snuff.

VI. United Methodist Free Churches.—The summaries of the statistical returns of this body as reported to the Conference in August are as follow: Number of itinerant preachers, 391; of supernumeraries, 40; of local preachers, 3,417; of leaders, 4,128; of members, 75,577; of persons on trial for membership, 8,575; of chapels, 1,357; of preaching-rooms, 203; of Sunday-schools, 1,352, with 26,851 teachers and 195,681 scholars. The net increase of members was 1,485, of which 204 had accrued from the foreign stations. The trustees of the chapel loan fund returned its capital at £10,082. The capital of the superannuation and beneficent fund was returned at £28,590.

The annual assembly of the United Methodist Free Churches met at Rochdale, August 1st. Mr. H. T. Mawson presided. The present meeting of the assembly was made the occasion of the commemorative celebration of the twenty-fifth anniversary of the union, in 1857, of the Wesleyan Methodist Association and the Wesleyan Reformers to constitute the connection in its present form. The celebration took effective shape in the collection of subscriptions to a commemoration fund, which were reported, at the close of the Conference, to amount to £14,031. The Conference decided that the fund should be appropriated as follows: To the mission fund, four sixteenths; to chapel funds, three sixteenths; to the London chapel extension fund, two sixteenths; to the Theological Institute, one sixteenth; to Asheville College, one sixteenth; unappropriated for the present, one sixteenth. The assembly recommended that one or two suitable men in the ministry be set apart for evangelistic labors, to hold services from circuit to circuit, in co-

operation with circuit ministers and officers; their work to be arranged under the direction of the connectional committee, who should appoint a secretary for the special supervision of it. The evangelists are to be assured their salaries. Resolutions were passed in favor of the repeal of the law prohibiting marriage with a deceased wife's sister.

VII. Methodist New Connection.—The following is a summary of the statistics of this body as they were reported to the Conference in June: Number of chapels, 514; of societies, 472; of circuit preachers, 188; of local preachers, 1,271; of members, 29,299; of probationers, 4,048; of members of Sunday-schools, 92,708. The sum of £17,640 had been raised and expended on connectional property during the year. The chapel loan fund had a capital of £4,500, with the additional sum of £700 nearly subscribed. The Book-Room had done a business of £8,500, and returned £279 of net profits. The income of the mission fund had been £6,404. The committee had expended, on home missions, £8,186; on the missions in China, £2,446; on those in Ireland, £662; and on those in Australia, £7,260. The income of the paternal or children's fund had been £2,966, and the sum of £2,384 had been paid to ministers for their children. The auxiliary fund had a capital of £2,049. The investments on account of the college were valued at £8,700. The beneficent fund returned an income of £3,257, and a capital of £22,365. The income of the contingent fund was £1,156.

The eighty-sixth Conference of the Methodist New Connection met in Sheffield, June 11th. The Rev. Thomas Rider was chosen president. The condition and prospect of the missions of the Connection received attention. An extension of the missions in Australia, as far as practicable, through the churches there, was recommended. Notice was taken of the existence of betting and gambling among Sunday-school scholars, and the attention of the conductors of Sunday-schools was directed to the importance of admonishing those under their charge of the evil of such practices. A memorial to the Government and a petition to the House of Commons in favor of closing on Sundays public-houses and clubs having licenses to sell liquor, were authorized.

VIII. Wesleyan Reform Union.—The statistics of the churches which are associated under this designation were reported at the delegate meeting in August as follow: Number of chapels and preaching-places, 216; of preachers, 457; of preachers on trial, 94; of ministers, 17; of leaders, 480; of members, 7,950; of persons on trial for membership, 713; number of Sunday-schools, 187, with 3,140 teachers and 19,715 scholars.

The annual delegate meeting was held in Sheffield, beginning August 4th. The proceedings consisted chiefly in the examination of chapel and financial affairs, and the review of the mission (home) and evangelistic work.

MEXICO, a republic of North America. Area, 761,640 square miles; population, 10,025,649. (For details relating to area, territorial division, population, etc., see "Annual Cyclopædia" for 1882.)

Government.—The President of the Republic is Gen. Manuel Gonzalez, whose term of office will expire on Dec. 1, 1884. His Cabinet is composed of the following ministers: Secretary of Foreign Affairs, vacant; Interior, Señor C. Diez Gutierrez; Justice and Instruction, Señor J. Baranda; Finance, Señor F. Fuentes y Muñoz; Public Works, Gen. C. Pacheco; War, Gen. E. Naranjo; Supreme Court, President (and Vice-President of the Republic), Señor G. Valle, and the magistrates are: E. Avila, J. M. Vasquez Palacios, C. Gonzalez Uroña, Melesio Alcántara, M. Auza, M. Contreras, M. Saavedra, J. de M. Vasquez, F. Vaca, M. Villalobos; with J. Soto, Attorney-General, and E. Ruiz, Procurator-General.

The Governors of the States are elected for a term of four years. The Governor of the Territory of Lower California is appointed by the Federal Government.

The Minister Plenipotentiary to the United States is Señor M. Romero; the Minister to Mexico is Hon. Philip H. Morgan. The United States Consul-General in the city of Mexico is David H. Strother.

Army and Navy.—The army in 1883 was composed as follows:

	Officers.	Men.
Foot (nineteen battalions).....	729	10,500
Horse (nine regiments) ..	518	4,176
Artillery (six brigades, each of five batteries)	150	1,017
Coast-guards.....	22	71
Rural guards.....	150	1,692
Invalide.....	19	250
Military colonies.....	180	1,168
Total.....	1,741	18,884

The navy consists of four gunboats.

Condition of the Country.—President Gonzalez, in his annual message to Congress, April 1, 1883, expressed himself on the general condition of the country as follows:

The country at large is in a prosperous condition, and the financial crises which at times have hampered business will soon leave no trace behind them. Improvements in the interior have been notable, of which everybody may easily convince himself. The Central Railroad Company has built over 1,500 kilometres of railway, the National line over 1,100, and the Huntington Company 117. There have been built in the republic during the year 4,800 kilometres. We have been compelled to modify the contract made with English bondholders, and negotiations to that end are proceeding favorably. Negotiations abroad to raise a \$20,000,000 loan will, I trust, soon be crowned with success. The revenue of the Government during the last fiscal year has reached \$33,500,000, showing an excess of \$1,500,000 over the previous year.

The revision of the tariff is nearly accomplished. The new postal laws will soon be in force, and our communications with the United States by land will be improved. Public instruction is in a flourishing state. Nothing is left undone to attract a desirable class of immigrants. The army is in a state of efficiency, and quiet reigns throughout the republic.

Relations with the United States.—The President of the United States, in his annual message to Congress of Dec. 4, 1883, expressed himself about our relations with Mexico to the following effect:

At no time in our national history has there been more manifest need of close and lasting relations with a neighboring state than now exists with respect to Mexico. The rapid influx of our capital and enterprise into that country shows, by what has already been accomplished, the vast reciprocal advantages which must attend the progress of its internal development. The treaty of commerce and navigation of 1848 has been terminated by the Mexican Government, and, in the absence of conventional engagements, the rights of our citizens in Mexico now depend upon the domestic statutes of that republic.

There have been instances of harsh enforcement of the laws against our vessels and citizens in Mexico, and of denial of the diplomatic resort for their protection. The initial step toward a better understanding has been taken in the negotiation by the commission authorized by Congress of a treaty which is still before the Senate awaiting its approval.

The provisions for the reciprocal crossing of the frontier by the troops in pursuit of hostile Indians have been prolonged for another year. The operations of the forces of both Governments against these savages have been successful, and several of their most dangerous bands have been captured or dispersed by the skill and valor of the United States and Mexican soldiers fighting in a common cause.

The convention for the resurvey of the boundary from the Rio Grande to the Pacific having been ratified and exchanged, the preliminary reconnaissance therein stipulated has been effected.

Our geographical proximity to Central America and our political and commercial relations with the states of that country justify, in my judgment, such a material increase of our consular corps as will place at each capital a consul-general.

Rejection of the Reciprocity Treaty.—The Mexican treaty was rejected by the United States Senate on January 18th, the vote showing that the majority in its favor lacked one vote of the two thirds required for ratification. The sugar and tobacco interests are arrayed solidly against it, and it was also opposed by some Senators on the ground that reciprocity treaties are of doubtful constitutionality, inasmuch as they tend to interfere with the free exercise by the House of its right to initiate bills raising the revenue; but the period allowed for its ratification has been extended by the President, the Secretary of State, and the Mexican minister to May 20, 1884, and thus there is still a chance for its adoption.

Finances.—The national and State finances, as shown by the budget estimates for the current fiscal year, exhibit the following details:

REVENUE.	Budget of 1883-'84.
Custom-House.....	\$19,000,000
Custom-House at Mexico and town dues.....	2,000,000
Stamp dues.....	4,500,000
Direct taxes.....	900,000
Mint.....	700,000
Instruction fund.....	80,000
Post-Office and telegraphs.....	700,000
Lottery.....	800,000
New tobacco and stamp taxes.....	2,000,000
Sundry incomes.....	1,200,000
Income of individual States.....	7,500,000
Grand total.....	\$39,880,000

EXPENDITURE.	
The Legislature.....	\$1,015,683
The Executive.....	48,583
Supreme Court.....	406,659
Foreign affairs.....	867,590
Interior.....	8,286,378
Justice and Public Instruction.....	1,248,510
Public Works.....	11,127,500
Finance.....	4,966,268
Army and Navy.....	8,252,353
Expenditure in the different States.....	7,500,000
Grand total.....	\$38,218,998

National indebtedness.—The foreign debt embraces the following items: English loan of Oct. 14, 1850, \$89,252,360; agreement of indebtedness to English bondholders of Dec. 4, 1851, \$5,900,025; ditto to Spanish, of Dec. 6, 1853, \$1,281,775; ditto, ditto, of Nov. 12, 1853, \$5,553,287; debt to the United States of July 4, 1868, \$2,475,123; together, \$104,412,570; internal debt, \$40,241,215; grand total, \$144,653,785.

The outcome of the recent negotiations between the representative of the Mexican Government and the committee of the council for foreign bondholders has not, it appears, been such as to improve Mexico's standing in the British market. The refusal of the Mexican Government to comply with the demands of the English bondholders for an issue of £20,000,000 of 3 per cent. bonds in addition to the debt of \$80,000,000, was made public through a cable dispatch.

In May, 1883, a congressional committee reported a bill authorizing the Executive to liquidate the national debt, excepting only the debts of the empire, those of the Miramon and Zuluaga Governments, and claims already rejected. Claims admitted by the Mexican and American commission and those for railroad subsidies are not affected by the proposed settlement. The Executive was authorized to issue bonds bearing 3 per cent. interest, to be receivable for Government lands, adjudicated property, and letters patent, the debt to remain national. The details of the settlement, involving the amount recognized, were left entirely to the Executive. Mexico acknowledges an indebtedness, principal and interest, of £16,000,000. A month previous to the introduction of the bill referred to above, a private agent of Mexico, without full authority, had made a preliminary agreement with the bondholders, by which Mexico was to replace the outstanding bonds with a new issue for £20,000,000 at 3 per cent. interest. The additional £4,000,000 were for the purpose of paying the first year's interest and reimbursing the expenses of the bondholders' committee. Subsequently Congress, by passing the bill above alluded to, authorized the President to settle the debt on the given basis, and the agreement was signed in London on May 12th. When the text of the agreement arrived from London, the President refused to approve the additional £4,000,000. Negotiations for a new agreement were then begun, but failed. Toward the end of October the President instructed Carlos Rivas, the Mexican agent in

London, to offer £18,000,000 in bonds, instead of £20,000,000. The offer was refused, and Rivas was instructed to suspend negotiations and return to Mexico. The Government declares that it is anxious to settle, but considers the demand of the bondholders exorbitant. Even before negotiations were broken off, Mexican securities had become very much depressed in London. The Mexican Secretary of the Treasury stated, on Nov. 24, 1883, that the debt which has been the subject of negotiation in London does not include the convention debt, which consists of the recognized bonded claims of British subjects.

Nickel Coin.—Under date of Nov. 29, 1883, it was reported from the city of Mexico that considerable confusion had been caused in retail commercial circles there by the large amount of nickel coin in circulation. Congress was discussing a law to regulate the nickel coinage and determine the extent to which it shall be made a legal tender. On November 28th a protest against the abuses occasioned by the nickel had appeared, and was signed by many persons. The proposed law only authorizes the coinage of 4,000,000 nickels among 10,000,000 people. The main objection seems to be, that the introduction of the new currency has been made awkwardly, and many say, unfairly. Instead of allowing the people to become gradually accustomed to the new coins, all at once the country has been flooded with nickel.

The Postal Service.—The business of the Mexican post-office has greatly increased since the reduction of domestic postage from twenty cents to ten cents. Number of post-offices, 886; 58 of which are chief offices, 267 express offices, and 516 agencies. Number of letters dispatched in 1881-'82: In the interior, 3,881,829, without counting 79,627 registered ones; sent abroad, 411,326, besides 8,596 registered; postal-cards, 7,081; together, 4,385,459 letters; newspapers, 2,943,880; samples, 8,053; total, 7,287,392 items of mail matter, against 6,462,807 in 1880-'81. Amount of postage collected, \$728,079, against \$641,067 in 1880-'81.

Telegraphs.—There is great activity in telegraph-construction. Nearly 18,000 miles of wire are in operation, and the telephone system is extensive and increasing rapidly. Length of wire of Government lines in July, 1883, 18,268 kilometres; of States, 1,484; private, 3,502; of railroads, 4,000; and cables, 875; together, 28,124 kilometres, equal to 17,718 miles. In 1881 there were only 17,061 kilometres; the increase in two years has therefore been 11,063 kilometres. Number of offices, 282; messages forwarded in 1880, 744,1917; net earnings, \$399,814.

There are in Mexico twenty-three telephone offices, with 1,600 instruments; the office in the city of Mexico has 700 subscribers.

Railroads.—The Mexican railway system in operation in the summer of 1883 was the following:

AMERICAN LINES.		MI.
Mexico to Aguascalientes, with branches (Central)....		345
El Paso to Durango (Central)		433
Tampico westward (Central)		62
Guaymas to Nogales (connected with Central).....		265
Mexico to Morelia (National).....		237
Laredo to Saltillo (National).....		320
Lines not yet connected (National).....		178
Altata to Cullacan (Sinaloa to Durango).....		86
Eagle Pass to Durango (Huntington).....		78
Total.....		1,940
ENGLISH LINE.		
Vera Cruz to Mexico (Mexican Railway).....		358
MEXICAN LINES.		
Mexico to Cuauclia and branches (Morelos).....		158
Yucatan line.....		66
Hidalgo line.....		56
Several small lines.....		300
Tehuantepec (bought back from Americans).....		26
Total.....		606
Grand total.....		2,923

Both the Central and National obtained their concessions in September, 1881, and began to work in the month following. The portion in operation of these two lines, taken together as given above, represents a value of \$60,000,000. The railroad prize of the near future is said to be the trunk line south of the city of Mexico. The Boston syndicate, controlling the Mexican Central, hope to push southward from Mexico. The Mexican Southern, Grant and Gould's consolidation, is designed for a trunk line through the southern Mexican States.

Antiquities.—The pyramid of Cheops is said to be dwarfed by the one discovered in the midst of virgin forest in 1883, near Magdalena, Mexico. It is said to have a base of 1,350 feet, and to be 750 feet high. There is a winding roadway from the bottom, leading by an easy grade to the top, wide enough for carriages to pass over, said to be twenty-three miles long. The outer walls of the roadway are laid in solid masonry, huge blocks of granite in rubble-work, and the circles are as uniform and the grade as regular as they could be made by our best engineers. The wall is only occasionally exposed, being covered over with *désbris* and earth, and in many places the *sahuaro* and other plants have grown up, giving the pyramid the appearance of a mountain.

At a recent meeting of the California Academy of Sciences, at San Francisco, Eusebio Molera read a paper on the Aztec calendar, or Mexican calendar-stone, from which an insight has been obtained of the extent of the astronomical knowledge of the Aztecs. The stone was unearthed in the city of Mexico on Sept. 17, 1790, and was placed in the wall at the base of one of the towers of the cathedral, where it remains to this day. The stone is eleven feet nine inches in diameter, and originally weighed twenty-four tons. The conjectures of antiquaries in relation to this object were reviewed by Mr. Molera, who thinks it was designed for one of the sacrificial stones on which captives were slain, their hearts being offered to the sun. He believed it was con-

structed under the second Montezuma, who, having done nothing to perpetuate his name, determined to construct a sacrificial stone as his predecessors had done. He wanted to make it larger than any of the others, and gave orders that it be two elbows larger than they were. The Indians began hauling the stone, which finally said it would not go any farther. There were 10,000 Indians pulling the stone, and the ropes broke, and the stone would not move. This the historians cite to show that supernatural phenomena were connected with the event. However, it appears that the stone was really brought to town, and it was so heavy that it broke the dike and fell down.

Wages.—Wages are steadily increasing in Mexico. In the capital, a common laborer receives \$1.25 a day. Mechanics get from \$1.75 to \$2.25. Along the railroad lines the prices are about \$1 a day for unskilled laborers, and \$1.50 to \$2 for mechanics. The laborers from the rural districts are coming in to the railroad districts in large numbers.

Gold and Silver Production.—Some of the gold and silver mines have been worked without intermission since the Spanish conquest. During colonial times, from 1537 to 1821, the silver-mines turned out \$2,035,000,000, and the gold-mines \$63,765,000. From the time when Mexico gained her independence to 1880, the silver product amounted to \$900,000,000, and the gold product to \$1,841,000. Grand total, 1537 to 1880, \$3,008,606,000.

Tin Discoveries.—The first ton of tin coming from the Durango mountains of Mexico was landed in the United States in 1833. This tin discovery was made by Mr. H. Freeman, of Australia, who spent a year in Mexico in prospecting for tin, following therein the records left by the Spaniards.

The Mines of Sonora.—Sonora has not more than 125,000 inhabitants, and 75,000 of these are Indians. There are about 5,000 natives of the United States in the State, mostly speculators. Fabulous sums are said to have been taken out of her mines, and now and then a vase filled with gold nuggets left by the Spaniards. Such a discovery was lately reported in Ures, \$80,000 in gold being found in an old earthen vessel a few feet underground. But, although there are many old abandoned mines that may be worked profitably, the principal industry is stock-raising and fruit-culture.

Resources of Michoacan.—Michoacan, brought into communication with the world at large by the opening of the Mexican National Railway to its capital, Morelia, is the Pennsylvania of Mexico. Here, in close juxtaposition, are found iron and coal. Pending their development, the State has other resources which now become of immediate value. In it is one edge of the great lumber-region of southern Mexico, the region whence in future must be drawn the domestic supply of lumber for the whole country; in it are extensive silver-workings, including the famous Coalcoman

mines; in it copper, lead, sulphur, marble, and lithographic stone are found; in it wheat, Indian corn, barley, beans (a most important crop in Mexico), sugar-cane, cotton, and coffee are grown; and in Morelia, a trim little city of 88,000 inhabitants, weaving and various small manufactures are carried on. These products furnish a substantial basis for a brisk export trade, and promise a counterbalancing import trade from Europe and the United States. Even the Mexicans themselves at last seem to be inspired with some sort of confidence in the future of their country. Heretofore, with some few exceptions, they have maintained a position of observation, while the "Americanos" have been building railroads and pushing other enterprises. Apparently now they are convinced that these ventures will pay; for that very rich and very conservative institution, the Banco Mercantile, the old "Spanish Bank," the strongest in the country, has agreed to advance at once \$500,000 against subsidy certificates owned by one of the American roads.

Tunneling a Volcano.—It is proposed to drive a tunnel into the crater of Popocatepetl, and to build from the mouth of the tunnel a railway to connect with the Interocceanic Railway at Amecameca. Those who are in negotiation for the property with the owner of the volcano, Gen. Gaspar Sanchez Ocha, are said to be a rich American house. The representative of the house visited the volcano with the French engineer Charles Roay. A contract is said to have been made for the exportation of 50,000 tons of sulphur a year. It is also proposed to establish a factory of sulphuric acid for use in Mexico, selling at \$3 a quintal of 101½ pounds, American, of 65° strength.

Petroleum.—A company, composed of Boston capitalists, has secured large interests in the Tuxpan oil-region, in the State of Vera Cruz. The company has been preparing for extensive developments for more than a year. The geological formation is the same as that of the Pennsylvania oil-fields, and there are many marvelous oil-springs. The oil-field lies at the base of the San Felipe mountains, southwest of the port of Tuxpan. The petroleum, which resembles in gravity and appearance the Pennsylvania oil, oozes from the rocks and ground in many places. Around a small lake in the district, Lake Culco, there are forty oil-springs; the oil runs from them in such quantities that the lake is constantly covered with it. Pennsylvania oil-well drillers are superintending the development of the district.

There are also extensive petroleum deposits in the State of Tabasco. The oil-fields, or what will be the oil-fields if they are ever developed, are about forty miles from the capital. What is undoubtedly the most promising oil territory in Tabasco—in the San José mountains—is owned by natives, who are not inclined to dispose of it, and who care nothing for the petroleum it contains.

Viticulture.—Great efforts were made in 1883,

in the Department of Public Works, to distribute fine grape-cuttings, and to encourage a large interest in viticulture, with the view of making Mexico a wine-producing country. At Paso del Norte, northern Chihuahua, and Durango and Coahuila, Mr. Parras, of the latter State, grows a grape from which a wine is made equal, it is said, to fine sherry. The Del Norte wine is made from the old Mission grape. It is a good table-wine, but as made now will not bear transportation.

Cedar and Pine.—The surveyors of the American and Mexican Railway report that there are immense forests of cedar and pine in the southeastern portion of Chihuahua. The entire Sierra Madre interiors are heavily timbered.

Bananas.—Mexican banana-planters get three crops a year. The plant is cultivated far more easily than any grain or tuber in northern latitudes, and the fruit is more nutritious. Even in spite of the price of the luxury, the demand for bananas has heretofore doubled in the United States about every five years since 1860, when the fruit-venders of American inland cities began to invest in an occasional cargo. But since the price of wheat, in crossing the Atlantic, increases only two thirds, there is no reason why bananas, in crossing the Rio Grande, should become twenty times dearer. In Western cities the poorest bananas can not be bought for less than three cents apiece, while in Oaxaca a "ramo," or bunch, with more than a hundred bananas of the very best quality, is sold for two reals, twenty-one cents. Among the wholesale planters of the rural districts, "ramos" of two hundred apiece, about the nutritive equivalent of three bushels of Irish potatoes, can be bought for one real. In slow-going fruit-barges, exposed to the seething sun, about 20 per cent. spoil before they reach New Orleans; but refrigerator cars would reduce that risk to a minimum.

The Toloachi-Plant.—The toloachi-plant grows everywhere in Mexico, but more thriftily in the tropical lowlands of the "tierra caliente." It is a harmless-looking plant, much resembling the northern milk-weed, and quite too dangerously convenient in a land where suspicion rules and jealousy amounts to madness. It does not kill, but acts immediately on the brain, producing first violent insanity and then hopeless idiocy. It is whispered that poor Carlotta had hardly landed at Vera Cruz, on her sorrowful mission to Mexico, before some of it was administered to her, and her deplorable fate is cited as one among many instances. Of all the dangers in Mexico, this is one of the most appalling. Any political enemy or jealous rival, or offended servant, may thus revenge himself in a more fiendish manner than with the stiletto, and with little fear of detection; a few drops of this tasteless white fluid, mixed with milk or other food, does its work with inexorable certainty, and can only be detected by its gradual results.

Property Rights of Foreigners.—Foreigners may

purchase, hold, and transfer lands anywhere in Mexico, as well as Mexicans, excepting lands of the public domain. That is, they have the right so to do, but it is not practicable. It is required of all notaries before whom deeds for lands on the frontier are executed, to recite, in the opening of the instrument, the residence and nationality of the parties, and, if the purchaser be a foreigner, to insist upon the production of his permit before proceeding. Also, that the fact of such permit (referring thereto as being then produced) should be recited in the deed, with its date. Without such declaration, the title may be legally declared void; at least, it would leave the title in grave doubt.

Immense Estates.—Much has been said and written of the great extent and large possibilities of Mexican haciendas. But probably few people outside of Mexico yet realize the extent of some of these tracts, where a million or a million and a half of acres often constitute a single estate in the hands of one owner. There are many such in Mexico large enough to hide away some European principalities, large enough to awaken the envy of landed proprietors in the United States. These are to be found in the central and northern States of Mexico. The famous Salado ranch, for example, contains more than 600 square miles. It lies partly in the States of Nuevo Leon, Coahuila, Zacatecas, and San Luis Potosi, on the highway to Mexico and on the line of the new railroads. It occupies the central table-lands of Mexico, at an average elevation of 4,000 feet. Chains of mountains traverse the estate, rich in mineral wealth. The boundaries of the estate extend more than 100 miles from north to south, and flourishing farms and large mining towns are met at frequent intervals.

Señor Antonio Asunsolo owns 650 square leagues, and is part owner and administrator of a tract of 1,945 square miles. He sold in 1883 to an English syndicate, for \$550,000, five haciendas, comprising 110 leagues, and the stock.

Industry in the Capital.—A great impulse has been given to manufacturing at the capital during the past few years, and there are now in the city of Mexico a great many hat-manufactories, 48 factories where dry goods are woven, chiefly shawls, 22 manufacturing saddlery, 26 silver-smiths' establishments, 32 metal-foundries, 12 iron-works, 7 copper-smiths' establishments, 12 match-factories, 14 chocolate-factories, and 10 candle-factories.

Immigration and Colonization.—The greatest activity is displayed, fostered by the Federal Government, to attract desirable immigrants, notably agriculturists, from Italy and the Spanish possessions, and settle them in colonies on the table-lands. Most of the 11,000 newcomers at Vera Cruz in 1882 were of these two nationalities, and 2,178 from the United States.

Commerce.—On Dec. 5, 1882, a treaty of commerce and navigation was signed between

Mexico and Germany, based, so far as the former is concerned, on the "most favored nation" clause. Negotiations have since been set on foot between Mexico on the one hand, and England and France respectively on the other, for the conclusion of similar agreements. The only advantages which the United States would possess over those nations, by the ratification of the pending reciprocity treaty, would be proximity of market and a lower freight-rate which the competition between railroads and ocean-steamers will secure. The amount of duties collected by the Mexican custom-houses from 1878 to 1882 was \$65,518,932. The ensuing table shows the increase of the average annual exportation from Mexico:

ARTICLES EXPORTED.	Quinquennial period, 1878-'82.	Triennial period, 1872-'75.
The precious metals.....	\$20,494,664	\$22,210,938
Sisal hemp and Tampico lute....	2,321,270	1,082,315
Coffee.....	2,022,986	908,889
Hides and skins.....	1,535,074	1,831,000
Cabinet-woods.....	1,514,073	1,250,675
Vanilla-beans.....	435,884	402,841
Cochineal and dye-woods.....	873,710	521,037
Sugar and molasses.....	826,835	83,854
Tobacco.....	252,464	90,570
Sarsaparilla.....	74,574	108,186
Other goods.....	928,452	791,965
Total.....	\$30,160,516	\$28,867,165

It will be noticed that while the export of the precious metals has decreased, that of other products has been on the increase. The average import in the fiscal years 1880-'81 and 1881-'82 was:

From the United States.....	\$5,044,035
From the United Kingdom.....	4,921,990
From France.....	3,547,740
From last two countries <i>via</i> Belgium and Germany.....	4,447,705
From Germany, Spain, and other countries.....	1,796,145
Total.....	\$19,757,665

While the imports of English and French dry goods have decreased somewhat, those of American have quadrupled.

The Mexican exports during the first quarter of the fiscal year 1882-'83 were as follow:

To England.....	\$2,941,755
To the United States.....	2,702,738
France.....	1,009,740
Spain.....	392,085
Germany.....	271,980
Colombia.....	98,478
Guatemala.....	88,800
Ecuador.....	200
San Salvador.....	180
Total.....	\$8,855,966
Of which the precious metals.....	\$6,004,807
Sisal hemp.....	794,967
Cabinet and dye-woods.....	875,959
Coffee.....	893,586
Hides and skins.....	193,815
Isle.....	154,798
Vanilla.....	41,883
Tobacco.....	86,129
Sugar.....	49,077
Honey.....	39,420
Live animals.....	87,720
Other goods.....	283,564
Total.....	\$8,855,966

	Precious metals.	Merchandise.	Total.
	Dollars.	Dollars.	Dollars.
Export, first quarter.....	6,004,807	2,846,129	8,855,956
Export, second quarter....	9,465,998	2,898,128	11,864,122
Export, third quarter.....	8,561,961	3,621,254	12,088,216
Total.....	24,032,766	9,365,506	32,398,274

The United States imported from Mexico during the fiscal year 1883, \$8,177,123 worth of merchandise, against \$8,461,899 the previous year; and the domestic export from the United States to Mexico was \$14,370,992 in 1883, against \$18,324,505 in 1882. The import of specie from Mexico into the United States was \$9,782,986 in 1883, against \$6,631,938 in 1882.

The chief articles imported into the United States in the fiscal year 1882 from Mexico were: Coffee, 17,020,669 pounds; Sisal hemp, 19,233 tons; hides and skins, \$1,525,107 worth; lead, 1,132,064 pounds; and sugar, 2,931,649 pounds. The principal articles exported from the United States to Mexico in the same year were: Manufactures of iron and steel, \$3,861,514 worth; 338 railroad-cars, worth \$579,421; 12,537,650 pounds of cotton; 10,584,486 yards of cotton goods; and \$1,426,411 worth of lumber, furniture, and wooden-ware.

Inter-State Trade.—The Federal Constitution of Mexico was amended in 1883, to enable the individual States to abolish the collection of interstate duties, which had been one of the greatest obstacles to commercial intercourse, and had become a positive nuisance since the introduction of railroads. In response to a circular issued by the Minister of Finance, the various States sent delegates to the capital, October 1st, and the necessary steps were taken, in conformity with the amendment, leaving the States to indemnify themselves by imposing each some State tax or taxes in lieu of the duties thus abolished.

Reduction of Duties.—In December, 1883, the duty on all goods imported under the Mexican flag was reduced by 10 per cent.

MICHIGAN. The biennial session of the Legislature began on January 3d, and continued 157 days, adjourning June 9th. The result was 197 public acts, 24 joint resolutions, and 341 local acts. Among the public acts of more general interest are:

An act authorizing a father to appoint in his last will and testament a guardian or guardians for his minor children, born or unborn at the time of making the will, subject to objection by the surviving mother when the will shall be offered for probate. The same power is given to the mother of a minor child whose father may have died without appointing a guardian. In the same line is an act "to provide for the establishment of wills during the lifetime of testators." As introduced, the bill provided for proving the will without making its contents known to heirs, legatees, or officials; but, as the law passed, the contents of the will become public at the time of the hearing thereon, thus defeating the real object.

An act to authorize the general laws of this State, collected, arranged, and annotated by Andrew Howell (or Howell's Annotated Statutes), to "be received

and admitted in all courts and proceedings, and by all officers in this State, as evidence of the existing laws thereof, with the like effect as if published under and by the authority of the State."

An act to regulate the practice of dentistry creates a board of examiners, and provides for the issue of certificates to dentists who are not in practice in the State at the time the act shall take effect, or who do not hold a diploma from the faculty of a reputable dental college.

An act to promote public health provides that it shall not be lawful for any person to practice medicine or surgery, or any branch thereof (except dentistry), without having the qualifications required in the provisions of this act, and without having first registered in the office of the county clerk as provided in this act. The "qualifications" prescribed throw the door to practice and the books of registration wide open to every person "who shall have actually practiced medicine continuously for at least five years in this State, and who is practicing when this act shall take effect."

An act creating a Bureau of Labor and Industrial Statistics, and defining the powers and duties of the same, charges the commissioner, his deputy and assistants, with the collection of "statistical details relating to all departments of labor in this State, including the penal institutions thereof." John W. McGrath, of Detroit, was appointed commissioner, who appointed John Devlin, of the same city, deputy.

An act "to protect the rights of laborers" prohibits a stay of execution on any judgment obtained before a justice of the peace for the personal work and labor of the plaintiff.

Provision was made for a more complete census of population and productions (agricultural and manufactures) to be taken in June, 1884; and an appropriation of \$60,000 was made for an asylum for insane criminals. It has been located at Ionia.

The list of joint resolutions includes two, amending the Constitution of the State:

1. So amending section 6 of Article VI (the judicial article) that the Board of Supervisors of each county in the Upper Peninsula may "give and pay to the circuit judge of the judicial circuit to which such county is attached, such additional salary or compensation as may from time to time be fixed and determined by such Board of Supervisors."

2. Fixing the compensation of members of the Legislature at \$700 for each regular session (in lieu of the present allowance of \$3 a day), and \$100 for each extra or called session. The ten cents a mile travel-fee is continued, and the limit of introduction of bills is practically removed by authorizing legislation on "such subjects as are submitted to them by special message of the Governor after the expiration of fifty days." A new clause of the section reads, "And no member of the Legislature shall accept or use any free pass or free ticket of any railroad during his term of office." Each of the proposed amendments is to be voted upon at the general election to be held on the first Tuesday in November, 1884.

United States Senator.—In the contest for United States Senator to succeed the Hon. Thomas W. Ferry, whose term would expire March 4, 1883, the Republicans nominated Senator Ferry for re-election, and Hon. Byron G. Stout was chosen as the "Union" candidate. In the ballot on January 16th, the Republican vote was divided, and no candidate received a majority in either house. Balloting was continued from day to day, without result, until March 1st, when on the eighty-first ballot the vote stood: For Thomas W. Palmer, Republican, 77; for Byron G. Stout, Democrat, 44; for Thomas W. Ferry, 8; for John W. Champlin, 1.

Political.—At the annual election held on the first Monday of April, two justices of the Supreme Court were elected (one for the full term of eight years, and the other to fill a vacancy created by the resignation of Justice Marston); also two Regents of the University of Michigan for eight years.

The Republican State Convention was held at East Saginaw, February 28th. The candidates nominated were: For Justices of the Supreme Court—Austin Blair, for the full term; Thomas J. O'Brien, to fill vacancy. For Regents, Harry B. Hutchins and Joseph C. Jones. A committee on resolutions was appointed, but failed to report, and no platform was adopted.

The Democratic State Convention was held at Lansing, March 7th. John W. Champlin was nominated for Justice of the Supreme Court, and Arthur M. Clark for Regent. The chairmen of the convention and the State Central Committee were authorized to notify the National Greenback Convention of the action, and in case no union was effected, to fill the vacant places in the ticket. The committee on resolutions reported a platform. A vigorous attack was made upon the declaration in the third resolution in favor of "a tariff for revenue only," but the convention almost unanimously refused to strike out the word "only."

The National Greenback State Convention was held at Lansing, March 8th. The proposition to unite with the Democracy and accept their nominations of the day before, was bitterly opposed, but on call of the roll was adopted by a vote of 383 to 79. The convention completed the ticket by nominating Thomas Sherwood for Justice of the Supreme Court, and Charles J. Willett for Regent of the University.

The Prohibitionists entered the canvass with a full ticket, and a platform demanding an amendment of the Constitution so as to prohibit the manufacture and sale of intoxicating beverages, beer included, and opposing license or taxation of the traffic. A fourth ticket was put forth by a few Greenbackers who repudiated the action of the State Convention. The election resulted as follows:

On Justice of the Supreme Court, full term: For John W. Champlin, Union, 127,376; Austin Blair, Republican, 119,870; John H. Tatem, Prohibition, 18,467; James S. Andrews, Greenbacker, 641. Plurality for Champlin, 7,506.

On Justice of the Supreme Court, vacancy: For Thomas R. Sherwood, Union, 124,639; Thomas J. O'Brien, Republican, 122,330; D. P. Sagendorph, Prohibition, 18,950. Plurality for Mr. Sherwood, 2,309.

On Regents of the University: For Arthur M. Clark, Union, 127,635; Charles J. Willett, Union, 125,405; Harry B. Hutchins, Republican, 120,627; Joseph C. Jones, Republican, 120,956; Joseph W. Ewing, Prohibition, 13,959; George S. Hickey, Prohibition, 13,762; Waldo May, Greenback, 466. Plurality for Clark, Union, 6,679; for Willett, Union, 4,449.

Finance.—The annual report of State Treasurer Butler for the fiscal year ending Sept. 30, 1883, shows the financial condition of the State as follows:

Cash balance, Sept. 30, 1883.....	\$1,757,983 81
Receipts for fiscal year	2,752,797 68
Total	\$4,510,780 84
Payments.....	8,486,468 64

Balance in treasury Sept. 30, 1883..... \$1,074,267 20

The bonded indebtedness was reduced during 1883 by the payment of the balance of the two-million loan, amounting to \$590,000. The bonded debt now is:

Part due part-paid five-million loan bonds, \$21,000, adjustable at \$578.57 per \$1,000 (not bearing interest).....	\$12,149 97
War-bounty loan bonds, due in 1890.....	297,000 00

For the payment of which are held:

In general fund.....	\$12,149 97
In hands of Fund Commission, United States 4½ per cent. bonds.....	297,000 00

The trust-fund debt, composed of amounts upon which the State as trustee pays interest for educational purposes, now is:

Agricultural-College fund.....	\$253,524 53
Normal-School fund.....	60,853 45
Primary-School fund.....	3,064,073 84
Primary-School five per cent. fund.....	844,194 81
University fund.....	493,401 82

Total..... \$4,921,063 95

Upon which interest has been paid from the specific-tax fund as follows:

To Agricultural-College interest fund.....	\$14,741 83
To Normal-School interest fund.....	2,623 12
To Primary-School interest fund.....	710,359 64
To University interest fund.....	84,352 09
Total	\$763,115 28

The trust-fund debt was increased during the year in the sum of \$188,196.84.

The receipts on account of specific taxes showed an increase from the preceding year of \$156,133.37; of which sum \$128,857.16 came from the railroad companies.

The total apportionment of State taxes was \$1,474,672.26, an increase over the apportionment for the year 1882 of \$353,581.03. The increase in the item for general purposes is \$338,400.92, or nearly the whole amount.

Railroads.—There were constructed in Michigan, by fifteen companies, during the year, 405.6 miles of railroad, the largest number of miles built by any State that year. The Michigan and Ohio, built by the Seney syndicate, was completed from Allegan to Toledo, 155 miles, much of it parallel with the Michigan Central.

Insurance.—The following figures are taken from the summary of the report of the State Commissioner of Insurance:

MICHIGAN BUSINESS, 1883.

NAME AND LOCATION.	RISKS WRITTEN.		PREMIUMS RECEIVED.		LOSSES INCURRED.		LOSSES PAID.	
	Fire.	Marine and inland.	Fire.	Marine and inland.	Fire.	Marine and inland.	Fire.	Marine and inland.
Michigan companies.....	\$18,501,257	\$1,490,693	\$167,892	\$10,197	\$61,928	\$5,290	\$50,601	\$3,578
Companies of other States..	149,450,285	11,044,896	2,166,140	96,699	1,117,305	89,980	1,033,984	75,010
Foreign companies.....	58,779,293	2,739,265	768,238	21,565	412,700	84,081	879,031	24,256

Education.—The following school statistics are furnished by the Superintendent of Public Instruction, in advance of the publication of his annual report:

Number of school districts, September, 1883.....	6,719
Increase over previous year.....	89
Number of school-houses.....	6,890
Increase over previous year.....	162
Number of children between five and twenty years of age.....	560,588
Increase during the year.....	22,477
Number of children attending the public schools.....	391,610
Increase over previous year.....	6,106
Number of sittings in public schools.....	435,836
Increase over 1882.....	3,481
Number of private and select schools.....	295
Number of teachers employed, male.....	127
Number of teachers employed, female.....	281
Increase over 1882.....	109
Wages paid teachers.....	\$2,461,496 66
Increase over 1882.....	267,588 73
Estimated value of school property.....	10,435,500 00
Amount on hand from previous year.....	983,638 22
Amount received from one-mill tax.....	640,141 50
Amount received on primary-school fund.....	724,564 21
Library moneys.....	82,665 90
Amount received as tuition for non-residents..	46,196 17
Amount received from district taxes.....	2,532,997 07
Amount received from all other sources.....	466,870 13
Total receipts for the year.....	\$5,883,426 20

Amount carried forward to next year.....	\$1,123,553 44
Expenditures, including wages of teachers, payments on debts, buildings, etc.....	4,259,873 76
Total expenditures for the year.....	\$5,883,426 20

From the annual report of the Warden of the State Prison, not yet in print, the following abstract is taken:

Number of convicts, Sept. 30, 1883.....	636
Received during the year.....	177
.....	813
Discharged by expiration of sentence.....	200
Discharged for new trial.....	8
Discharged by order of Supreme Court.....	1
Pardoned by Governor.....	19
Lost by escapes.....	4
Died.....	6
Transferred to Detroit House of Correction.....	2
.....	285
In prison, Sept. 30, 1883.....	573
Average length of sentence, 3 years, 9 months, 26 days. Classification by crimes: Murder in first degree, 3; murder in second degree, 8; manslaughter, 1; felonious assaults, 8; robbery, 10; rape, 4; attempt to rape, 3; abduction, 1; assault with intent to rob, 1; polygamy or bigamy, 4; incest, 1; against	

property, 115; forgery and counterfeiting, 12; perjury, 3; riot, 1; jail-breaking, 2.

The net earnings for the year were \$6,329.98; the net expenditures, \$89,257.70.

Iron.—The amount of iron-ore shipped from Lake Superior mines in 1888 was 2,851,872 tons: the approximate value of which was \$13,677,919. The Lake Superior charcoal-furnaces in 1888 produced 57,884 tons of iron, the approximate value of which was \$1,291,140. The product of the Lake Superior iron-mines since 1868 is 23,126,078 tons.

Salt.—The following table shows the amount of salt inspected in Michigan in 1888:

DISTRICTS.	Fins, balk.	Fins, barrels.	Pekers'.	Second quality.	Total.
Saginaw county*..	286,885	919,085	3,682	9,620	1,185,957
Bay county.....	217,907	680,418	3,422	5,820	1,106,461
Huron county.....	253,946	5,734	6,289	256,965
Iosco county.....	209,297	679	663	210,644
Midland county.....	59,370	6,756	66,126
Manitowish county.....	46,207	1,906	481	48,594
Grant county.....	3,086	2,100	6,176
St. Clair county....	3,392	1	1,387	4,780
Grand totals....	454,192	2,874,796	15,494	33,526	2,894,673

The above table shows a decrease in the amount inspected during the fiscal year from that of 1887 of 142,645 barrels.

Lumber.—The aggregate lumber-cut of 1888 was 938,675,078 feet, which was about 73,000,000 feet less than that of 1887.

MINNESOTA. State Government.—The following were the State officers during the year: Governor, Lucius F. Hubbard, Republican; Lieutenant-Governor, Charles A. Gilman; Secretary of State, Frederick von Baumbach; Treasurer, Charles Kittelson; Auditor, W. W. Braden; Attorney-General, W. J. Hahn; Superintendent of Public Instruction, D. L. Kiehle; Adjutant-General, A. O. Hawley; Public Examiner, H. M. Knox; Insurance Commissioner, A. B. McGill; Commissioner of Statistics, Oscar Malmbros; Railroad Commissioner, James H. Baker. Judiciary, Supreme Court: Chief-Justice, Charles E. Vanderburg; Associates, William Mitchell and D. A. Dickinson.

Legislative Session.—The Legislature convened on the 2d of January, and adjourned early in March. On the 1st of February, and on the thirtieth ballot, Dwight M. Sabin, Republican, was elected United States Senator by a vote of 81 against 30 for William Windom, 15 for Gordon E. Cole, and 9 for Lucius F. Hubbard.

Upward of 1,000 bills were introduced, of which about half became laws. Of those passed the larger number are special acts. The general laws outside of general appropriations number 150. Fifty-odd bridge appropriations were ordered, and a score of bills passed for general appropriations. Thirty-one bills relating to St. Paul and Ramsey county passed,

while Hennepin county and Minneapolis asked legislation to the extent of 25 bills.

Among the number of valuable additions to the statute-books is the act creating a Board of Public Charities and Corrections; the bill making murder punishable with the death-penalty; and the law regulating the practice of medicine and providing for the examination and licensing of all physicians who shall come to Minnesota, for five years. The savings-bank law was amended to permit the savings-banks to loan money in Dakota, and State banks were put upon the same platform as national banks in the matter of making their reports. A law likely to be fraught with some good and possibly some evil was the one making void bills, notes, and other negotiable paper obtained by fraud or artifice in the hands of any third person. A codification of the laws—stringent and comprehensive—for the prevention of the spread of infectious diseases became a law, while the companion bills, to prohibit the pollution of waters and to regulate slaughter-houses, failed. The date of beginning the fiscal year in the State was changed from November 1 to July 1. The chief appropriation was \$806,000 for improving the State Prison, the sum to be distributed over about ten years. Among the acts passed were also the following:

To prevent setting fire to woods, prairies, or other grounds.

To provide for borrowing money to defray the extraordinary expenditures of the State government.

To punish willful violation and omission of duty and gross negligence of duty on the part of railway employes.

Amendments were proposed to the Constitution, to be voted upon at the November election, viz.:

The official term of the Secretary of State, Treasurer, and Attorney-General shall be two years. The official term of the State Auditor shall be four years, and each shall continue in office until his successor shall have been elected and qualified.

The official year for the State of Minnesota shall commence on the first Monday in January in each year, and all terms of office shall terminate at that time; and the general election shall be held on the first Tuesday after the first Monday in November. The first general election for State and county officers, except judicial officers, after the adoption of this amendment, shall be held in the year 1884, and thereafter the general election shall be held biennially. All State, county, or other officers elected at any general election, whose terms of office would otherwise expire on the first Monday of January, A. D. 1886, shall hold and continue in such office, respectively, until the first Monday in January, 1887.

Increasing the term of office of the Clerk of the Supreme Court from three to four years, and reducing the official term of the judges of the supreme and district courts from seven to six years.

The proposed prohibitory amendment failed.

The appropriations made by this session, including standing appropriations of former Legislatures, for public institutions, current expenses, bridges and miscellaneous purposes, for the thirty-one months ending July 31, 1885, amounted to \$2,682,987.25.

Finance.—The report of the Treasurer for the

* Includes 16,785 barrels of solar salt.

eight months from Dec. 1, 1882, to July 31, 1883, the end of the new fiscal year, shows the following receipts and disbursements:

The receipts:

For revenue fund	\$546,890 31
For State institutions fund	484,277 18
For interest fund	65 48
For sinking fund	984 95
For seed-grain sinking fund	978 88
For permanent school fund	316,249 07
For general school fund	286,615 45
For permanent university fund	20,875 09
For general university fund	41,899 57
For internal improvement land fund	53,939 91
For forestry fund	27,014 52
For redemption fund	7,957 19
For internal improvement land fund interest	83,614 76
For swamp-land fund	50 00
For attorney Twelfth District	1,499 94
For school text-book fund	19,255 79
Total	\$1,575,198 99
Balance in treasury Dec. 1, 1882	148,098 58
Total receipts	\$2,018,297 57

The disbursements:

From revenue fund	\$570,842 69
From State institutions fund	386,917 07
From interest fund	3,490 83
From sinking fund	25,000 00
From redemption fund	9,549 61
From seed-grain sinking fund	1,000 00
From permanent school fund	404,800 00
From general school fund	85,297 86
From general university fund	67,216 51
From internal improvement land fund	10,658 88
From internal improvement land fund	86,935 00
From forestry fund	1,195 61
From internal improvement land fund interest	30,595 67
From attorney Twelfth District	1,499 94
From school text-book fund	20,286 97
Total disbursements	\$1,714,711 18

There was in the treasury a balance of \$557,744.27 Nov. 30, 1881. For the year ending Nov. 30, 1882, the receipts were \$2,201,415.79, and the disbursements, \$3,058,317.21, leaving a balance of \$143,098.58. The total bonded debt of the State was placed at \$4,339,000. The total taxable value of all property for 1882 was \$311,193,435.

The number of children enrolled in the public schools in 1883 was 191,873.

Agriculture.—The crops of 1883 are reported as follow: The yield of wheat was for 2,571,637 acres 88,305,373 bushels, an average of 14.89 bushels to the acre. There were 922,818 acres sown in oats, returning 84,448,609 bushels, an average of 37.33 bushels to the acre. Barley, 304,006 acres, producing 7,344,785 bushels, or 24.16 bushels per acre. Rye, 25,834 acres; production, 439,178 bushels. About 764,637 acres were planted in corn. The crop was poor in quantity and quality. The following was the yield of 1882:

Wheat	Bushels.	82,461,006	Oats	Bushels.	25,600,068
Corn	16,673,142	Barley	6,036,750		

Dairy Products.—The Auditor's report for 1883 gives a total of 301,688 milch-cows in the State, the assessable value of which is set at \$5,499,000. In 1882 there were 272,681 milch-cows, valued at \$4,983,000; and in 1881 the number was 267,577, worth, at \$18 each, about \$4,248,000.

The value of this year's butter product in Minnesota, at an average valuation of 30 cents

a pound, will exceed \$5,300,000, and that of last year was close to \$5,000,000. In 1880 there was not a single creamery in the State worthy the name, and the one erected at Spring Valley in 1881 was much commented upon. Now there are seventy creameries or butter-factories of considerable size, and their number is being augmented almost every month. There were produced in 1882, 17,186,788 pounds of butter.

Party Conventions.—The Republican State Convention met in St. Paul on the 27th of June, and nominated the following ticket: For Governor, Lucius F. Hubbard; Lieutenant-Governor, Charles A. Gilman; State Treasurer, Charles Kittelson; Secretary of State, Frederick von Baumbach; Attorney-General, W. J. Hahn; Railroad Commissioner, James H. Baker.

The Democratic State Convention met in St. Paul on the 2d of August, and nominated the following ticket: For Governor, W. W. McNair, of Minneapolis; Lieutenant-Governor, R. Frazee, of Becker county; Secretary of State, J. J. Green, of Le Sueur; Treasurer, John Ludwig, of Winona; Attorney-General, John W. Willis, of St. Paul; Railway Commissioner, A. T. Lundholm, of Stillwater.

Mr. McNair declined, and Mr. Bierman was substituted in his place.

Election Returns.—At the election in November, the Republican ticket was successful by the following majority: Hubbard, 9,149; Gilman, 14,290; Von Baumbach, 24,045; Kittelson, 23,035; Hahn, 28,295; Baker, 23,452. The amendments received an average majority of 50,072.

Cyclone.—Near the end of August a cyclone struck the city of Rochester, Olmsted county, a handsome place of about 6,000 inhabitants, and in a brief time over 100 houses had been entirely demolished, 19 persons killed, and nearly 100 wounded. The storm passed through sections of Dodge county, leaving a trail of death and destruction.

MISSISSIPPI State Government.—The following were the State officers during the year: Governor, Robert Lowry, Democrat; Lieutenant-Governor, G. D. Shands; Secretary of State, Henry C. Meyers; Treasurer, W. L. Hemingway; Auditor, Sylvanus Gwin; Attorney-General, Thomas C. Cutchings; Superintendent of Public Education, J. Argyle Smith; Commissioner of Agriculture and Immigration, E. G. Wall. Judiciary, Supreme Court: Chief-Justice, J. A. P. Campbell; Associate Justices, H. H. Chalmers and Timothy E. Cooper. The only election during the year was for members of the Legislature. That body, when it meets in 1884, will consist of 33 Democrats, 3 Republicans, and 1 Independent in the Senate, and of 99 Democrats, 12 Republicans, and 5 Independents in the House.

Finance.—The Auditor's report shows the valuation of the property in the State to be as follows:

For 1882, realty	\$70,712,851	} State tax..	\$293,565 42
For 1882, personally ..	87,313,209		
Total	\$118,026,060		
For 1883, realty	\$87,504,173	} State tax..	\$316,887 51
For 1883, personally...	89,168,754		
Total	\$196,754,927		

The assessment for 1883 shows an increase of \$20,556,227 over the valuation in 1879, when the land was last assessed.

The following extract from the Treasurer's report for the years 1882 and 1883 will show the general financial condition of the State:

RECEIPTS.	
The receipts for 1882	\$770,959 52
The receipts for 1883	747,864 75
Cash balance in the treasury, Jan. 1, 1882.....	645,106 23
Total	\$2,062,980 55

DISBURSEMENTS.	
The disbursements for 1882	\$1,057,441 05
The disbursements for 1883	896,494 90
Cash balance in the treasury, Jan. 1, 1884.....	165,939 60
Total	\$2,062,980 55

RECOGNIZED INDEBTEDNESS.	
Chickasaw school fund	\$315,709 71
Chickasaw school-fund interest	10,876 13
Common-school fund, old account	517,046 45
Common-school fund, distributive	123,139 10
Seminary fund, account of University of Mississippi.....	544,061 23
Warrants outstanding	30,173 99
Certificates of indebtedness outstanding	2,556 00
State bonds, series "G," past due and not presented	1,000 00
Mississippi 4 per cent. bonds due Jan. 1, 1890 ..	216,000 00
Agricultural-College bonds due Jan. 1, 1896.....	227,150 00
Interest on 8 per cent. State bonds, past due and not presented	390 00
Deposits by insurance companies, currency not included in cash balance	60,000 00
Railroad-tax for distribution	37,293 21
Swamp-land fund	83,587 23
Total	\$2,974,593 06

On the 1st of January, 1882, there was a cash balance of \$545,106.28 in the treasury. On the 1st day of January, 1884, this balance was reduced to \$168,939.60.

Education.—"It affords me pleasure" says the Governor, "to be able to state that the cause of education is at present receiving more attention in Mississippi than at any former period of her history. The average attendance for 1882 and 1883 was largely in excess of that of any previous years since the inauguration of the system. Teaching in public schools has improved, and this is due in part to the introduction of teachers' institutes in many counties. Great interest is being manifested in the State Teachers' Association, which has been organized in this State, and the recent meeting was largely attended."

During the session of 1881-'82 there were in the literary department of the University of Mississippi 202 students; in the law department, 12. During the session of 1882-'83, there were in the literary department, 245; in the law department, 14. The present session opened in September, and at the close of 1883 there were enrolled in the literary department, 236; in the law department, 9.

In June, 1883, the trustees opened the doors

of the university to women, and 12 matriculated the following session. There are now 22 in attendance.

The last Legislature appropriated \$8,000 for the repair and improvement of the university buildings. The law prohibiting the sale or giving away of intoxicating liquors within five miles of the university is working well.

In the Agricultural and Mechanical College, the first year, there were 854 students: 87 in college classes; 267 in the preparatory department. The second year, there were 304 students: 150 in college classes; 154 in the preparatory department. The third year, there were 317 students: 148 in college classes; 169 in the preparatory department.

The college has received from the State in the aggregate \$205,000. With this sum and \$9,000 given by the citizens of Starkville, and the interest on the land-scrip fund, and \$15,000 realized from the sale of bonds, authorized by an act approved March 7, 1882, the college has been supported for three years, and has acquired property worth \$180,357.

In the past three years the college has realized from the sale of surplus produce of the farm and dairy, \$7,447.44.

In the Alcorn Agricultural and Mechanical College the attendance for the past two years has been rather larger than heretofore, but it still averages only 100 a year. One great difficulty the institution encounters is the broken and irregular attendance of the pupils, but few going the entire session. There have been but three graduates since the college was founded. The faculty is composed of the president, two professors, and one tutor. The college is practically a normal school for the education of colored teachers, though agriculture is taught with some success.

In Tougaloo University the attendance is larger than at any previous time, there being a total of 147—74 males and 73 females. The school was never so well equipped and officered. The managers and instructors number 13. The expense per month for board and tuition is \$10. About 200 acres of land are in cultivation. Most of the labor is done by the students. An industrial superintendent has recently been added to the corps of instructors.

The institution was founded and is carefully supervised by the American Missionary Society of New York.

The school-buildings are valued at.....	\$26,000 00
The farm, with buildings, is valued at	11,500 00
The stock and vehicles are valued at.....	8,500 00
Total	\$51,000 00

State Institutions.—In the Lunatic Asylum the death-roll has been larger than usual, owing, it is thought, to overcrowding and an insufficient supply of water. The completion of the East Mississippi Insane Asylum will enable this one to reduce the number of patients.

The total amount expended on account of the Institute for the Blind for the year 1882 was.....	\$37,576 12
And for the year 1883.....	11,798 67
Total	\$49,374 79

The entire cost of the present establishment, including the \$15,000 originally appropriated and expended in 1880-'81, is \$46,119.80.

The building was completed in September, 1882, and possession taken in October following. Since that date everything has been working to the satisfaction of the Trustees.

Under the management of Mr. J. R. Dobyns, who continues in charge, the Institution for the Deaf and Dumb has attained unusual and extraordinary success. The pupils have made rapid advances, and can communicate their thoughts with readiness and facility by signs and in writing. Articulation instruction has been introduced within the last two years with gratifying success. There were in attendance, in 1882, 57 whites and 15 colored; in 1883, 66 whites and 15 colored. The last Legislature appropriated \$3,000 for the erection of buildings on the lands adjacent to the city of Jackson, in the possession of the Board of Trustees, suitable for the accommodation, care, and instruction of the colored deaf-mutes. A site was secured and necessary buildings erected, within the appropriation, for that purpose.

On the first day of January, 1884, there were in charge of the lessees of the Penitentiary 771 convicts, of whom 696 are colored, 74 are white, and 1 Indian. During the last two years, beginning Jan. 1, 1882, and ending Dec. 1, 1883, 218 have died, 118 have escaped, and 25 have been recaptured. During the two years preceding those last named, out of a total of 376 convicts, 122 died, 136 escaped, and 25 were recaptured. The number received in 1882 was 408; in 1883, 293. The number of convicts by crimes against person is 548; against property, 223. The number discharged in 1882 was 219; in 1883, 144.

Progress of the State.—In regard to the recent progress of the State, the Governor reports:

In the last two years alone 461,783 acres have been purchased through the Auditor's office from the State. There is a growing confidence in the future, as shown by the purchase of these lands and of 435,110 acres of lands held by the Federal Government in the last two years, together with the unprecedented homestead entries, amounting to 286,288 acres. The reduction in the debt and the rate of taxation and yearly expenditures has been accomplished without detriment to the public service or neglect of the different charitable and educational institutions. All these have been liberally sustained and new ones established. During the past two years some 450 miles of railroad have been built in Mississippi. Large sums have been invested in cotton-factories, oil-mills, cotton-compresses, etc., and I am pleased to say that the investment has been profitable in every instance. The capacity of some mills has been doubled within the last two years, and they are still unable to supply the demand for their fabrics.

Manufactures.—To encourage the establishment of factories in this State, the Legislature of 1882 passed an act exempting from taxation, for ten years, the machinery used for the manufacture of cotton and woolen goods, yarns or other fabrics, composed of these or other materials, or for the making of all kinds of machinery or implements of husbandry, or all other articles not prohibited by law.

There are fourteen cotton and woolen factories: The Wesson mills, at Wesson; Natchez cotton-mills, at Natchez; Rosalie cotton-yarn mills, at Natchez; Stonewall cotton and woolen mills, near Enterprise, Clark co.; Juanita cotton and woolen mills, near Enterprise; Ullman woolen-mills, at Bay St. Louis; Yocona cotton-yarn mills, at Water Valley; Stansbury cotton-mills, at Carrollton; cotton-mill at Canton, and two cotton-mills at Corinth; Bay Springs cotton-factory, Tishomingo co., and another at Port Gibson.

There is a cotton-seed oil mill at Natchez, two at Vicksburg, one at Port Gibson, one at Jackson, one at Yazoo City, one at Grenada, one at Columbus, one at Meridian, one at Aberdeen, one at Lexington, one at Refuge Landing, one at Greenville, and a number of others in process of construction. A great many saw-mills are going up throughout the long-leaf pine region, a good many built by Northern capital. Besides these, there are a great many in operation already.

Timber.—There are 20,000,000 or more acres of timber-lands, which consist of pine, red-gum, oak of many varieties, cypress, magnolia, willow, cottonwood, beech, locust, and elm. Of long-leaf pine, in the region of Pearl river, contiguous to the Illinois Central Railroad, there is perhaps 6,000,000,000 feet (board-measure) now; east of Pearl river there is perhaps the same quantity. There is perhaps of the short-leaf pine standing, 7,000,000,000 feet. The red-gum, to which the people heretofore attached but little value, is now taking its place to some extent.

Health.—About 784 cases of small-pox have been reported as occurring in the State in 1882 and 1883. Where an extensive outbreak of the disease has occurred, it has been the rule to place an inspector in charge, and to employ guards, both on foot and mounted, when necessary to secure the isolation of cases.

Concealed Weapons.—On this subject the Governor says:

A fruitful source of crime is the too prevalent habit of carrying concealed weapons. Impulses are often born of opportunities, and it frequently happens that the possession of a pistol presents strong temptation to its unlawful use. In my opinion the most efficient remedy for the evil of carrying concealed weapons is to make their use to kill, or attempt to kill, a crime not admitting of defense, so that, if killing or attempting to kill is by means of a weapon drawn from concealment on the person, there shall be no excuse or justification. If one could not, under any circumstances, lawfully use a deadly weapon, carried in concealment on the person, he would cease to carry it.

Miscellaneous.—On the 17th of January a convention of citizens interested in the culture of jute was held in Jackson, and on the 1st of October an Interstate Levee Convention assembled in Vicksburg. In April a cyclone swept over a portion of the State, being especially destructive in the towns of Wesson and Beau-regard, where many lives were lost.

MISSOURI. State Government.—The State officers during the year were the following: Gov-

ernor, Thomas T. Crittenden, Democrat; Lieutenant-Governor, Robert A. Campbell; Secretary of State, Michael K. McGrath; Treasurer, Philip E. Ohappell; Auditor, John Walker; Attorney-General, Daniel H. McIntyre; Superintendent of Public Schools, William E. Coleman; Register of Lands, Robert McCulloch; Superintendent of Insurance Department, John F. Williams; Railroad Commissioners, George C. Pratt, Archibald Sevier, and Jas. Harding. Supreme Court: Chief-Justice, Warwick Hough; Associate Justices, John E. Henry, Elijah H. Norton, Robert D. Ray, and Thos. A. Sherwood.

Legislative Session.—The Legislature met January 8d, and adjourned April 2d.

Among the acts passed are the following:

To prevent the change of rates for freight without notice thereof by railroad companies in this State; to protect owners of property shipped for sale on commission, and to punish persons for making false returns of such sales; concerning persons charged with crime and becoming insane between indictment and trial, and to provide for their disposition; to protect Government lights and light-house stations on the navigable waters of this State; to prevent and punish malicious mischief; to provide for counting, comparing with the list of voters, and examining ballots in cases of contested elections; creating a State Board of Health, and defining its duties and powers; relating to the deposits of foreign insurance companies; to provide for a topographical survey of the sunken and overflowed lands of southeast Missouri; to authorize corporations which have been or hereafter may be organized for the purpose of reclaiming swamp and overflowed lands to levy in certain contingencies an additional tax of fifteen cents per acre per annum; to regulate the practice of dentistry in the State; to regulate the practice of medicine and surgery in the State; to facilitate the assessment and collection of revenue; revising and amending the general laws in relation to roads and highways, and providing for establishing, opening, repairing, and vacating the same; to provide for the construction of turnpike-roads; to establish a Bureau of Labor Statistics, and inspection of factories, mines, and workshops throughout the State, and to provide for the appointment of an inspector of the same.

Two amendments to the Constitution were proposed, to be submitted to the people in November, 1884. One of these provides for the raising of a tax of not over fifteen cents on the \$100 for road and bridge purposes. The other extends the jurisdiction of the St. Louis Court of Appeals over fifty-five counties as well as the city, and establishes at Kansas City an additional appellate court, to be known as the Kansas City Court of Appeals, having jurisdiction over the residue of the State, and consisting of three judges. It also gives the Legislature power to create one additional Court of Appeals, and to regulate the jurisdiction of these courts. Other important acts are the so-called "Downing high-license" law, and the act creating a commission of three judges to relieve the Supreme Court. The general appropriation bill provides for \$6,134,301, and the special appropriations \$550,000, \$100,000 being to extend and repair the State University.

Education.—The report of the Superintendent of Public Schools shows that decided improvement was made in the public schools of the

State during the year. The statistics, while approximately correct, are quite unsatisfactory, for many county clerks fail to make correct returns from all the districts, and some fail to make any report whatever. In referring to colored schools, the superintendent says:

The prejudice heretofore existing against colored schools and the education of the colored youth, to give them equal advantages with the whites, as the law directs, has in a great measure disappeared, and the colored schools are maintained for the same length of terms as the white schools. Sometimes a case arises where the people or board refuse to open a colored school as the law directs, but only a few such cases have been reported to my office. Nearly all the colored schools are taught by colored teachers, and, so far as at present known, they are all colored. This plan is less objectionable and works much better than otherwise.

The last General Assembly made appropriations for educational purposes as follow:

One fourth of revenue	\$292,242 14
Interest on school fund	174,540 00
State moneys, 1884	564,762 14
Estimated for 1884	570,000 00
University (for building)	100,000 00
University support	54,540 00
Agricultural College debt	28,000 00
School of Mines, support of	15,000 00
Normal School, Kirksville	20,000 00
Normal School, repairs	15,925 50
Normal School, Warrensburg	20,000 00
Normal School, repairs	15,000 00
Normal School, Cape Girardeau	20,000 00
Normal School, repairs	12,750 00
Lincoln Institute	12,500 00
Repairs for same	8,500 00
Deaf and Dumb Institute	92,500 00
Repairs for same	24,000 00
Blind Asylum	52,000 00
Repairs for same	5,900 00
Increase of school fund	218,462 99

Total appropriation

\$1,843,890 93

The following report is made by the County School Commissioners, showing the number of children of school age in the State:

White children	719,670
Colored children	43,838

Total

762,998

White children enrolled	457,509
Colored children enrolled	23,820

Total

511,329

The number of teachers employed in the State is 12,077; average monthly salary, \$46.61.

Finances.—Between the 1st of January and the 1st of September the Fund Commissioners purchased and retired 572 State bonds of \$1,000 each, which leaves still outstanding of the bonded debt of the State \$13,231,000. The remainder of the debt will mature as follows:

1885	\$4,000	1890	\$242,000
1886	1,856,000	1892	884,000
1887	3,137,000	1894	49,000
1888	3,184,000	1895	625,000
1889	848,000	1911	3,081,000

The assessed value of the taxable property last year was \$656,250,413, an increase of \$6,983,171 over the valuation of 1882, and \$54,528,000 over that of 1881. The State taxes collected last year amounted to \$3,345,378.

Temperance Convention.—The Prohibition Alliance of the State met in Warrensburg on the

26th of June, and remained in session until the 28th. Its resolutions included the following:

That we hereby pledge our individual and organized efforts for the defeat of any candidate for the next General Assembly of the State, whether the nominee of a party or not, who shall refuse to declare publicly in writing that if elected he will vote and industriously labor for the submission of a constitutional amendment prohibiting the manufacture, for sale, and the sale of intoxicants, as a beverage, within this State.

MONTANA. Territorial Government.—The territorial officers during the year were: Governor, John Schuyler Crosby; Secretary, Isaac J. McOutcheon.

Railroads.—Three years ago the Northern Pacific Railroad reached the eastern border of Montana, and in August of this year the two ends met, 50 miles west of Helena. There are 787 miles of its trunk line within the Territory, and two branch lines have been completed, one from Livingston to the borders of the National Park, 50 miles, and another to the mining center at Wickes, 20 miles. There are also in the Territory about 200 miles of narrow-gauge road, a part of the Union Pacific branch extending from Ogden, Utah, to a connection with the Northern Pacific at Garrison, Montana, with a branch at Butte.

Banks.—Montana has twenty-five banking institutions, nine of which are national banks. Four of these latter are in Helena, and have a combined capital of \$875,000, with deposits to the amount of \$4,800,000.

Finances.—In 1882 there was a total assessment of \$33,211,319, an increase of \$9,170,511 over 1881. The assessment for 1883 is about \$46,560,800. Even this fails to do the Territory justice, for it does not include a dollar for the mines, whose net income alone is taxed.

The Territory does not owe a dollar, and the aggregate indebtedness of the thirteen counties is under \$1,000,000, mostly incurred for public buildings, and for roads and bridges.

The expenditures for 1882 by warrants drawn on the treasury amounted to \$61,067.52. The estimated expenditures for 1883 were \$70,500.

Amount of revenue proper collected during 1882.. \$90,863 47
Amount of revenue proper collected during 1881.. 75,296 64

Increase of revenue proper for 1882..... \$15,576 83

Schools.—The only means of support for the schools is a property-tax, divided among the districts of each county in proportion to the number of children of school age. By territorial law this county school-tax can not be less than three mills nor more than five mills on the dollar. It averages about four mills. In addition to this, many districts vote an additional special tax to extend the school term. All of the larger places have provided themselves with convenient school-houses. Besides those of former years, seven large graded school-buildings of the first class are in process of construction, and the value of school-buildings in the Territory is fully \$200,000.

General Condition.—On this subject the Governor in his report, dated Oct. 31, 1888, says:

At the time of the census of 1880, Montana had fewer than 40,000 inhabitants. That same year witnessed the entry of the first railroad within her borders. During the ten preceding years the population had barely doubled, but within the past three years it has advanced from 40,000 to upward of 80,000. While it is true that much of Montana's surface seems adapted to a scanty population engaged in pastoral pursuits, other sections, covering probably a fourth of its area, creviced and underlaid with mineral wealth, are certainly destined to give homes and employment to a dense population at no distant day.

The last Territorial Legislature authorized a call for a Constitutional Convention with a view to submit the Constitution framed to the vote of the people in November, 1884. The convention will assemble in January, and the members have already been elected.

The following was the vote for delegates in Congress in 1882: Martin Maginnis, Democrat, 12,398; A. O. Botkin, Republican, 10,914.

Some experiments are now in progress to test the feasibility of artesian wells. One at Miles City has struck a strong flowing stream at the depth of 852 feet.

Timber-Lands.—The timber-lands of Montana are almost exclusively confined to the mountains—estimated to cover two fifths of the Territory—where the lands would be of very little or no value when once stripped. Every year witnesses a greater waste by fires, that care might prevent, than would suffice to supply the wants of settlers.

Mining Products.—The rich placer-mines of early days have probably yielded up their most bountiful harvests, yet the oldest ones continue to be worked with good results. A great deal of what is properly mineral land is still more valuable for agriculture, in which it produces year after year, instead of being worked out for a single harvest, though a rich one. But the more permanent and productive mines are the quartz-lodes of gold, silver, and copper, of which the entire range of the Rocky mountains and its various spurs seem to be full, focusing at certain points in surpassing richness. In every county of the Territory, with the possible exception of Dawson, the easternmost, these mineral veins are known to exist. They are best developed and most productive in Silver Bow county, of which Butte City is the center. The gross yield of the mines of that single county for 1888 was upward of \$4,000,000. "The most careful recent estimate," says the Governor, "is to the effect that the yield of \$10,000,000 of the present year will be increased for 1884 to \$30,000,000 in gold, silver, copper, and lead."

It is estimated that over 20,000,000 pounds of copper will be shipped in 1884 from the mines at Butte, Silver Bow county.

Live-Stock.—The following shows the most recent returns of live-stock:

	NUMBER.		VALUE.	
	1882.	1883.	1882.	1883.
Cattle.....	287,210	475,000	\$4,699,812	\$14,250,000
Sheep.....	362,778	700,000	1,018,124	2,100,000
Horses.....	67,000	90,000	8,197,020	6,787,000

Indians.—The Governor recommends the curtailment of the Indian reservations, which comprise nearly two fifths of the Territory, while the Indians number not more than 18,000. "Besides the matter of cutting down the Indian reservations," he says, "a heavy and pressing duty rests upon the General Government for their support and education. The great body of the Blackfeet, North Piegans, Assinaboines, and Gros Ventres are even in a half-starved condition, owing to the failure and disappearance of the buffalo and other large game. These Indians must be supplied before spring, or they will have to choose the alternative of starvation or stealing the white man's cattle. They should be placed on smaller reservations, and be recompensed for the lands surrendered by supplies of stock, cattle and sheep in particular. The Flatheads on the Jocko reservation are well advanced in civilization and toward self-support. The disappearance of the larger game and the want already experienced make these Indians willing to exchange land for cattle, and anxious to cultivate the land."

Mormons.—There is a settlement in Deer Lodge county, and another in Gallatin county, of monogamic Mormons, expelled from Utah for their apostasy. Their numbers are small, they are industrious, good citizens, and they seek no proselytes; and their children, growing up under the training of the schools and in association with the citizens of the Territory, rise above and drift away from Mormonism.

MONTENEGRO (Cernagora, "Black Mountain"), a principality in eastern Europe. The government is an absolute monarchy. The legislative and executive powers, and the control of the revenue, remain practically in the hands of the Prince, though organic statutes of 1852, 1855, and 1879 introduced the representative principle in the form of a legislative body, called the State Council, of eight members, one half elected by the male inhabitants who bear arms or have done military service. The throne is hereditary by male primogeniture in the family of Petrovich Njegos, who liberated the country from the Turks, and was proclaimed Vladika, or Prince-Bishop, in 1697. Danilo I, who succeeded his uncle, Prince Peter, the celebrated poet and reformer, in 1851, abandoned the title of Vladika, and assumed that of Hospodar. He was assassinated, Aug. 13, 1860, and was succeeded by Nicholas I, the present reigning Prince. The inhabitants of Montenegro are divided into forty tribes, each governed by elected elders and a chief, called the Knjas, who acts as judge, and in time of war is the military commander. By the administrative statute of 1879, the country was divided into eighty districts and five military commands. There is no standing army, except the Prince's body-guard of one hundred men; but in case of war all Montenegrins are soldiers from the time when they can first bear arms until they have no more strength. The military population is divided into companies

of a hundred men. Each military district furnishes a battalion, or two if it has more than eleven companies. The ministers are the sovereign's appointees on the Council of State.

Statistics.—The area is about 3,470 square miles. The population is officially reported as 286,000. With the exception of about 4,000 Catholics and as many Mohammedans, the people are adherents of the Greek Orthodox Church. There are about 2,000 Montenegrins in Austria, Turkey, and Russia, and a small number in Alexandria and San Francisco. The capital, Cetinje, has about 2,000 inhabitants. Podgoritz, Dulcigno, Nikitchich, and Antivari are somewhat larger.

The exports are estimated at 2,000,000 florins (\$1,000,000); they consist of rabbits and hare, cheese, fish, smoked mutton, wool, sumac, wine, fruits, etc. There are 444 kilometres (or 228 miles) of telegraphs.

Ministerial Changes.—During the insurrection in the Crivoscie and the Herzegovina in 1862, Prince Nicholas preserved an attitude which the Austrian resident minister, Col. Thömmel, reported to be perfectly correct, notwithstanding the dispatches of the commander of the Austrian forces, Baron Jovanovich, to the contrary. The sympathy of the Montenegrins for their kindred in the annexed provinces was too strong to allow the Prince to carry out any loyal intentions he may have had of preserving neutrality. The pretended military cordon was a fiction, for fugitives who were disarmed at the frontier were provided with weapons and ammunition again in the interior, and used Montenegrin territory as a base for their raids, until the Austrians established a cordon on their side, and thus crushed out the rebellion. This formidable frontier guard is permanently maintained. The Austrian party in Cetinje was headed by the Voyvode Mascha Vrebica, Minister of the Interior. The more powerful Russophile party had for its leader Bozo Petrovich, President of the Senate, a cousin of the Prince. The feeling against Austria became more decided when the Prince received in reply to his demand of indemnification for the support of the refugees, the answer from Vienna that he might keep them. The Austrian Government relented to the extent of amnestying all but the leaders of the Herzegovinians, who were glad to return to their fields. But the Crivoscians were left to encumber the scanty resources of the Cernagorans. Prince Nicholas, familiarly called Nikita, visited St. Petersburg later in the year, and returned the sworn ally of the Czar. After his return, the agitators, confined in compliance with Austrian demands, were set at liberty. Shortly afterward the Minister of the Interior was dismissed. Bozo Petrovich succeeded him as Minister of the Interior and became Minister President. The Minister for Foreign Affairs, Stanko Radonich, and the Finance Minister, Ilija Cerovich, sent in their resignations, but the former was retained.

Marriage of Princess Zorka.—The attention of Europe was attracted to the movements of the Servian pretender, Peter Karageorgevich, in the early part of the year. This prince had spent his life and dissipated his fortune in weak and hopeless attempts, instigated by Austria, to stir up a rebellion in Servia and regain his father's throne; he visited Montenegro and was received with many marks of cordiality and respect by Prince Nicholas. Prince Peter denied that his visit had any political significance, declaring that he came simply on a pious pilgrimage to the seat of his ancestors and the home of Servian liberty. The close and cordial relations between the Czar and Prince Nicholas were remarked at the coronation at Moscow, where the Cernagoran prince appeared by the side of the Czar as though he were a relative, and alone of all the foreign visitors received popular ovations. On August 10th, Peter Karageorgevich was given in marriage at Cetinje, Prince Nicholas's eldest daughter, Zorka. The Russian Government, according to rumor, furnished a handsome dowry. The idea of a Great Servia, under Russian protection, is the chief aim of Russian activity in the Balkans. Prince Peter Karageorgevich's father was driven from the throne on account of his subservience to Austria. The same fate now threatened the house of Obrenovich. But the immediate recognition of Prince Peter's claims did not seem likely to be the object of Russia in taking him under her protection. From various expressions of Prince Nicholas, it appears that he has hopes of founding the kingdom of United Servia. Montenegro was the only Servian land not subjugated by the Ottomans. A Servian song says that, when Freedom deserted the Servians, she escaped to the crags of Cernagora.

Turkish Boundary Difficulty.—The Turkish boundary question was stirred up again in the early part of 1883, after resting since the end of 1880. The line drawn through the map by the plenipotentiaries at the Berlin Congress was even more difficult to establish than the new boundary of Greece. The delimitation was carried out in the main according to the Berlin Treaty before the naval demonstration of the powers in 1880, with the exception of the transfer of the districts of Plava and Gusinje, patrimonial possessions of the clans of the Hotti and Klementi. This transfer could not be effected without a bloody conflict with the then all-powerful Albanian League. The outcome of the intervention was, that Montenegro retained, in the place of those districts, the port and district of Dulcigno, which are more valuable than any of the lands ceded by the Berlin Treaty. The southeast boundary of Montenegro remained undetermined until the principality pressed for a settlement, and in January, 1883, the preliminaries were arranged between Bedry Bey, as Turkish plenipotentiary, and the Montenegrin commissioners. The settlement which they arrived at regard-

ing the line to the northeast of Lake Scutari preserved the actual frontier, leaving the villages of Matagosh and Vladnia to Turkey, and Gosik, as well as the hill of Voina, which is of strategic importance for the defense of Podgoritza, in Montenegrin possession. The continuation agreed upon as far as Planinica corresponds with the line stipulated in the Treaty of Berlin, the boundary between the Kuchi Kraina and the Gruda and Klementi tribes.

The portions adjacent to Lake Scutari were transferred to the Montenegrin authorities, and occupied without difficulty. In the Kraina the delimitation agreed upon could not be carried out without a conflict. The Albanians gathered to resist the occupation with arms, but the Turkish military interposed and loyally assisted the Montenegrins to establish their authority after a severe skirmish. The Porte declared its willingness to evacuate the Ottoman portion of Kolashin, but when it refused to give up part of the Plava-Gusinje territory, Montenegro broke off the negotiations and appealed to the signatory powers. Upon receiving no answer to the first communication, of January 31st, it addressed a note of urgency to the powers, February 9th, declaring its intention to take forcible possession of Matagosh and Vladia, and asking for a decision of the boundary dispute. On February 11th the Gruda, Klementi, Kastrati, and Shkrieli clans met in Bessa and swore the *bessa* (blood-pact) against the Montenegrins and the Turkish troops, in case they should attempt to partition their lands. They showed their temper in two sanguinary skirmishes with the Turkish military in Scutari. The Albanians, with the experience of their race-kindred in Podgoritza to teach them, have stronger grounds than simple religious and national sentiment to resist being handed over to Montenegrin jurisdiction. The new code of laws, elaborated by Prof. Bogosich, can not counteract the national prejudices and propensities which refuse equal rights to Mussulmans in Montenegro. Their lands and herds are divided up among Montenegrins on perpetual leases at arbitrary rentals which they are unable to collect, and they themselves are driven to emigrate, or expelled on a trumped-up charge of conspiracy, if other means fail.

Border Warfare.—A border war was carried on between the Albanians and Montenegrins for two or three months. Fierce skirmishes, which were no better than butcheries, took place all along the frontier, and a long list of blood-revenges was treasured up on both sides. Every Montenegrin fled from Scutari, and peaceful communications were entirely interrupted. At length, after a third note to the powers had failed to stir them from their apathy, the Montenegrin Prince fell in with the desire of the newly-appointed Vali of Scutari to put an end to the useless bloodshed by reopening negotiations. An interview was held at Rjeka, April 21st, in which the Vali, Mustapha Assim Pasha, said that the Klementi and

Hotti would never become Cernagoran subjects, and could not be made to abandon their pasture-lands without force, and that the Porte was not willing to carry on a military campaign against them to carry out uncertain provisions of the Berlin Treaty. Prince Nicola replied that these things should have been thought of before signing the treaty, that Montenegro had need of valley-lands, and that it had an historical claim to territory once peopled by Serbs and ruled by the Servian emperors. With that it was agreed to postpone discussion for several months, and leave the boundary controversy open while peace was being restored and friendly intercourse resumed. Mustapha Assim Pasha invited the Albanian chiefs to a conference to discuss measures of public safety, but the message was answered with a refusal. The chiefs of the Shoshi, Shallas, Marturi, Nikai, Gashi, Kastrati, and Hotti, all belonging to the Malissora group of tribes, communicated with the Mirdites, and the Luria, Matija, and Dibra-Posht tribes, with whom the *bessa*-oath had been taken. An assembly was held at Kastrati April 26th. Here it was resolved to revive the Albanian League. They swore together to resist any encroachment of Montenegro on Albanian territory, and the Ottoman authorities if they infringed on the rights of the tribes. No communications were to be held with the Vali. The Albanians sent for a large supply of cartridges for the Martini-Henry and Snyder rifles with which they were all armed. The Vali strengthened the garrison at Tusi, and upon his urgent request 6,000 Nizams were sent from Oréte. The Porte admonished the new Vali to adopt conciliatory methods with the Malissora tribes. An obnoxious ordinance relating to the collection of the tax on cattle was revoked, but orders were given to collect the tax where the authorities had the power. This, and the firing upon the Djovanni, a branch of the Shoshi tribe, when they entered Scutari to purchase supplies, exasperated the Albanians. The unnecessary severity of the Vali in preventing the harboring of outlaws in Scutari drove a number of influential persons into the mountains to aid in the organization of the League. A proclamation was issued to the Hotti, Gruda, and Kastrati, May 19th, assuring them that the Sultan desired nothing but the conservation of their ancient customs and their submission to his authority. A deputation of the tribesmen met the Pashas at Scutari. Mustapha Assim Pasha declared that a regulation of the boundary-line was unavoidable. This question, the Albanian representatives replied, could only be considered by a council of all the tribes. From the general council the answer came that the Albanians had for four hundred years given proofs of their readiness to give their lives for the Padishah, and that they would not enter into negotiations with the Government, which had often deceived them, unless they had a guarantee that the Government would not

demand the cession of their territory to their mortal enemies. The Vali then announced that the regulation of the boundary would be carried out—with force, if necessary. The League held an assembly at Rabshi, May 25th, which resolved to send armed men into the disputed district to be ready for eventualities.

On the night of June 1st they took Tusi by surprise, captured all the military stores, disarmed the garrison, and sent the troops to Matagos. A simultaneous attack upon Helmi was frustrated through the vigilance of the garrison. Hafiz Pasha, with a body of Cretan Nizams, marched against the Albanians. He was preceded by a deputation of notables of Scutari, who brought back word that the troops would not be allowed to enter the territory of the tribes. When the Turkish troops appeared, the Albanian outposts opened fire. The Nizams advanced to the village of Kastrati, where a desperate fight of several hours' duration took place. The steam ironclad and gunboats on Lake Skadar bombarded and destroyed the village. The next day, in order to gain time for re-enforcements to come up, Hafiz Pasha resumed negotiations. In the night of the 2d, contingents of the Hotti, Shalla, and Shoshi tribes came to the aid of Kastrati. Abdul Aga, the Hotti chief, took command and ordered an attack. The battle lasted from morning till night. More than 500 dead and wounded covered the field. A truce was called on the 5th for the burying of the dead, but a conflict took place between the Albanian re-enforcements, who were hurrying to the scene of conflict, and the Posripa tribe. The latter joined the League after their chief had fallen. On the 6th hostilities were renewed in the vicinity of Shiptzanik, where the Albanians had intrenched their camp. The battle was decided by the Krupp artillery of the Turks, and in the afternoon the Albanians retreated in good order toward the northeast into the district of the Hotti. Hafiz Pasha advanced on his march to Tusi. The next morning he was again set upon by Abdul Aga's bands near Hum. In a furious hand-to-hand combat hundreds fell on both sides. Although terrible damage was inflicted on the Turks, his own forces were so weakened that the Albanian commander retreated into the mountains.

On the 9th Hafiz Pasha reached Tusi, but could not retake the fort without re-enforcements. Mustapha Assim Pasha was preparing to march into the field in person, when lightning struck the powder-magazine at Scutari, June 8th, and destroyed the whole supply of ammunition. On the night of the 9th some bands of the Skreli crept up to the intrenchments with which Hafiz had surrounded his camp, and from under the cover of the trees opened fire. In the darkness the Turks fought with one another, killing and wounding 300, while the Albanians disappeared. When the Pasha made ready on the 11th to proceed to Tusi, he found the road blocked by superior numbers of the mount-

aineers. He concluded, therefore, to make secure his communications with the coast and relieve Fort Helmi, which was besieged by 1,000 Klementi. With his four or five battalions of available troops he was unable to penetrate to the besieged garrison, which suffered for want of food and water. After a couple of days of skirmishing, finding himself nearly surrounded by the Albanians, who were continually receiving re-enforcements, the Turkish commander decided to give battle rather than retreat across Lake Scutari. On the 14th and 15th the Turkish Nizams fought with desperate courage. Many hundreds of corpses covered the field. Three Krupp guns were captured by the Leaguers. Hafiz Pasha then sent a message, proposing a truce and negotiations, to the Albanian leaders, Abdul Aga Hotti and Dod Prechi. The latter refused to treat, knowing that it was only a *ruse* to gain time for re-enforcements. Hafiz Pasha then crossed the lake in a sail-boat and returned on the 17th with three battalions. His troops had defended themselves with difficulty against incessant attacks. With the fresh troops Hafiz again took the offensive, and in an eight hours' battle compelled the League troops to retire. These battles cost the Turks over 1,200 men; the Albanians reported their loss as 800.

Marching farther, Hafiz Pasha encountered the Malissori near Shin Mari, where his army was again surrounded. The Albanians were rendered savage and desperate by the ruthless acts of the Turks, who burned all the villages and farm-houses on their way. The Turkish troops fought their way through after a day and a night of fighting, but left several hundred dead on the battle-field and 50 captives in the hands of the Albanians. Another Turkish detachment under Shaban Bey was defeated on the 16th and 17th, with a loss of 250, near Tusi, which place was burned by the Albanians. On the 18th two battalions of Nizams came up, with four guns, whereupon the Albanians retreated into the district of the Hotti.

Forced back in front by Hafiz Pasha and on the flank at Tusi, the Albanians retired into their mountains and confined themselves to defending the defiles of approach. The Turkish commander pitched his camp near Spinje and opened negotiations, on the basis of instructions from Stamboul, for the subjection of the insurgents. The latter, who were encamped in the approaches to Gruda, suffered from the want not only of ammunition, but of food, as their herds were in Mirdita or far away in the mountains. Hafiz Pasha demanded unconditional surrender, but promised the tribes complete amnesty and the confirmation of their ancient rights. Recently the Vali, Mustapha Assim Pasha, had called upon the Kastrati chief Dod Bachir, whose lands were in the ceded territory, to help effect the peaceable transfer, and the latter accompanied his refusal with an expression of amazement that the Porte should wish to get rid of loyal sub-

jects by force. The League commanders, Abdul Aga Hotti, Nicol Mirasi, and Shaban Smaku, refused to deliver up the leaders, but agreed to surrender on the condition that the integrity of their territory was guaranteed, and that they should be left free to defend it eventually against the Montenegrins. Hafiz Pasha rejected the conditions, and left them another week to consider. As a proof of his determination, he burned the rest of the villages, and destroyed the growing corn and gardens. The League renewed its appeal to the representatives of the powers at Scutari, getting no encouragement with regard to the boundary question, but receiving a promise to intercede with the Turkish authorities and endeavor to induce them to proceed less barbarously. As the result of their efforts, the Vali went among the insurgents and proclaimed the intentions of the Porte to grant an amnesty and indemnity for the destroyed property. Hafiz Pasha, who had received large re-enforcements, began strategic operations, which led to fresh skirmishes, in which the Turkish artillery carried the day. A demand for the surrender of the chiefs of the rebellion was again refused, but the Albanians continued negotiations.

A deputation of the League then went to Montenegro and opened secret negotiations with the Government. They proposed that Montenegro should assume a protectorate over all the Malissori tribes, which should be gradually extended over the whole Ghegi territory; that the Montenegrins should confirm their particular rights, respect their religion, and not interfere in their administration further than was the practice with regard to the tribes that were already subject to the Montenegrin rule. In return, the Albanians promised to aid the Montenegrin Government in war, in the same way as they have the Porte, to pay the same contributions that they have to the Porte, and to annul all existing blood-oaths. These unexpected propositions were at first received favorably by the Montenegrins, though the scheme could not have been definitely settled, as Prince Nicholas was absent in Paris. Hafiz Pasha, growing impatient, pressed for a decision, and received the answer that the Albanians would not deliver up their chiefs, but that if he attacked them again, they would go over to the principality of Montenegro.

The Leaguers relied on the experience of the Turks of their ability to defend the passes of the mountains indefinitely and with little difficulty. With their old muzzle-loading muskets this was possible. But they had not learned to make the cartridges for the Martini-Henry and Snyder rifles, with which they were now armed, and, although they had friends enough in Scutari, it was useless to attempt to get cartridges in any quantity, first through the custom-house and then out of the city and through the Turkish lines. The suppression of the rebellion was only a matter of time. First the Kastrati, whose villages were burned, sent back

the arms which they had captured from a transport and made their submission. The leaders either joined the Skreli or fled to Montenegro; their houses were fired and their cattle confiscated. The Shalli and Shoshi, who had attacked the garrison of Scutari in April, were excluded from the amnesty. In July an expedition was undertaken against these tribes and against the Skreli, who were responsible for the murder of Salih Aga. The Skreli sent a deputation, offering to yield to the demands of the Government. Hafiz returned to Tusi and sent word that the murderer of Salih Aga must be surrendered and the chiefs come to Scutari to receive the commands of the Vali. The tribe refused these terms, and Hafiz again set out with six battalions and four mountain-guns. Three sharp skirmishes took place, in which the Skreli were victorious. Yet when the Shalla and Shoshi, after hearing of the submission of all the other tribes, also accepted the amnesty, the Skreli withdrew to distant fastnesses in the hills, whither Hafiz Pasha had no inclination to follow them, content with having secured the rectification of the frontier, and pacified the neighborhood of Lake Scutari. The deputations of the Shalla and Shoshi were well received by the Vali, and the Stamboul authorities were so gratified at the favorable termination of the difficulties that they imposed no ransom for the attack on Scutari. Their leaders escaped into the Herzegovina. All the tribes were commanded to deliver up to the Government the weapons it had furnished them at the time of the Russian war and during the conflict with the great Albanian League, a mandate to which no attention was paid. On the 10th of August Hafiz Pasha made his triumphal entry into Scutari.

The Porte was informed betimes of the secret offer of the Malissori tribes to accept a Montenegrin protectorate, which was made in June. Engagements were said to be entered into with the Cettinje Government to avert this, but the substance of the promises has not been divulged. Prince Nicholas visited Stamboul soon after, and was received with great hospitality and distinguished honors by the Sultan. He is the first prince of the Cernagorans who has paid a visit to the Padishah since the foundation of the principality. This event made a profound impression on the Albanians, who for centuries have been accustomed to regard the Turks and Montenegrins as irreconcilable enemies. At this interview the boundary dispute, after years of diplomatic controversy, was settled in an hour between the heads of the two states. The Prince of Montenegro was persuaded to relinquish his claims to the lands of the Hotti and Kastrati, who retain their pastures undivided. In compensation, Montenegro receives accessions of territory in the Plava and Gusinje districts.

The delimitation commission met directly after the return of Prince Nicholas. The line northeast of Lake Scutari to Gradishte was

fixed. The district of Planinica as far as Mocha, and thence to Mojkovac on the Tara, which is the terminal point of the delimitation, was not marked out by the end of the year.

MORGAN, Edwin Denison, an American merchant, born in Washington, Berkshire county, Mass., Feb. 8, 1811; died in New York city, Feb. 14, 1883. At the age of seventeen he entered the store of his uncle, Nathan Morgan, with whom, in about three years, he became a partner. In 1836 he removed to New York, and engaged in business on his own account, as a grocer, in Front street. From that time till the date of his death his life may be divided into three periods. The first embraced about twenty years, during which he was most active and energetic as a merchant, extending his operations to distant lands, and becoming well known as a successful importer. His connection with the firm of E. D. Morgan & Co., as senior partner, was continued through various changes in its organization, and only ceased with his death. For another period of about twenty years, including a portion of the years allotted to his active business career, he was largely identified with the political life of his adopted city and State, and of the United States—being at one time a member of the Board of Aldermen of New York; twice State Senator; a delegate to the conference assembled at Pittsburg in 1856; chairman of the convention that followed at Philadelphia, and afterward chairman of the National Republican Committee; twice Governor of the State of New York; and, finally, a member of the United States Senate. During the term for which he was elected to this last high office he was never once absent from a meeting of the Senate, and was one of its most efficient working members.

On the conclusion of his term, in 1869, the ex-Senator directed his energies largely to the various institutions with which he was connected as a director, notably with the National Bank of Commerce, the United States Trust Company, the Lake Erie and Western Railroad Company, and the Western Union Telegraph Company. He was for many years President of the Woman's Hospital of New York, and associated with many charitable associations, to all of which he was a liberal benefactor. He gave \$100,000 to Williams College, and a like sum to the Presbyterian Theological Seminary. In his long, active, and varied career as merchant, statesman, and trustee, he enjoyed a high character for integrity, ability, and sound judgment, commanding in all these various relations the entire confidence of his fellow-citizens. He was twice tendered the office of Secretary of the Treasury, but declined it. His appointment by President Arthur was confirmed by the Senate, but the office was refused because of age and increasing infirmities. His interest in politics did not cease with his retirement from the Senate, but his counsel was always at the command of those

filling the highest offices in public life. In the critical period of our civil war, during which he was Governor of New York, his services were as important as those of any other Governor, and contributed largely to the final success of the national cause. He was tendered by President Lincoln the appointment of major-general of volunteers, and accepted the rank, but declined any compensation for services. A memorial volume, with a fine portrait, was printed privately by his widow, who, with an only grandchild, survives him.

MORRILL, Lot M., an American lawyer, born in Belgrade, Maine, May 8, 1813; died in Augusta, Maine, Jan. 10, 1883. He entered Waterville College (now Colby University) in 1835, but did not remain through the year. He then studied law, and in due time was admitted to the bar. One of his fellow-attorneys was Timothy O. Howe, with whom he was later associated in the United States Senate. He removed to Augusta, established himself in practice, and took the lead in the Democratic party in Maine. In 1854 he was elected to the Legislature, where he gained much reputation; and on his re-election in 1856, he was chosen President of the Senate. In 1855 Mr. Morrill denounced the course of his party on the question of slavery in Kansas, and severed his connection with his former associates. He was nominated in 1857 by the Republicans for Governor, and was elected by over 15,000 majority. His administration was very successful, and he was twice re-elected; and he served his native State in that office during the years 1858-'60.

In 1860 Senator Hamlin was elected Vice-President of the United States, whereupon Gov. Morrill was chosen by the Legislature to serve during the remainder of Hamlin's term. He entered the Senate Jan. 17, 1861, and was placed on important committees. He attended the "Peace Conference," from which much was hoped, but which led to no beneficial result. During the two years that followed, Morrill took an active part in public affairs, and in 1868 he was elected Senator for the term ending in 1869. He was chairman of the Committees on Expenses, on the District of Columbia, on Appropriations, and on Indian Affairs. In the Republican caucus for a successor, Mr. Morrill was defeated by a single vote; but, as Senator Fessenden died in 1869, Morrill was appointed to serve out the remainder of Fessenden's term. In 1871 he was again elected Senator, and in the discharge of his duties devoted much attention to financial questions. He was what was called a "hard-money" man, and voted against the bill for inflating the

currency, which was vetoed by the President, and voted in favor of the resumption act of 1875. He was noted as being a steady, hard worker in committee-rooms, and was especially familiar with naval and Indian affairs.

On Secretary Belknap's resignation, President Grant asked Senator Morrill to take a seat in the Cabinet, but he preferred to remain where he was. In June, 1876, his name was sent in by the President for the Treasury Department, and he was immediately confirmed. During the few weeks before entering upon his new and important duties, he was busily engaged in looking after the appropriation bills. He was chairman of the Senate Committee on Appropriations, and strained every nerve to carry these important measures. He bade farewell to the Senate on July 6th.

As Secretary of the Treasury Mr. Morrill was able and energetic, and gave very general satisfaction. He was familiar with all government business, was inflexible and resolute in enforcing the laws, and showed that clear common sense which is always popular in a minister of finance. In November, 1876, while in New York, he made an address to the moneyed men of the metropolis, from the steps of the Sub-Treasury Department, which proved effective and well-timed. His annual budget, in December of the same year, was very straightforward, and gave a clear presentation of the financial condition of the nation. He urged immediate and yet gradual contraction of the currency, and declared that specie payments could be resumed in 1879. His recommendations had the merit of simplicity and directness. He asked Congress to give him authority to fund greenbacks at his discretion, in 4½ per cent. thirty-year bonds, and to compel the national banks to accumulate coin.

When Mr. Hayes became President, in 1877, he offered Mr. Morrill a foreign mission; but it was declined. He was appointed, in March, Collector of Customs for Portland and Fal-mouth district, Maine, which post he held at the time of his death. On getting back to his native State, he took but little active interest in politics. His health became infirm, and he suffered greatly from inflammation of the stomach. In his last illness, attended by his wife and family, he sank quietly and peacefully to rest. Although not to be called eloquent in speech, or brilliant in debate, he was always earnest, clear, and sensible. With a fine head and an impressive air and manner, Mr. Morrill rarely failed to convince his hearers that the measures he advocated were judicious and sound in principle.

N

NEBRASKA. State Government.—The following were the State officers during the year: Governor, James W. Dawes, Republican; Lieutenant-Governor, Alfred W. Agee; Secretary of State, Edward P. Roggen; Treasurer,

P. D. Sturdevant; Auditor of Public Accounts, John Wallich; Attorney-General, Isaac Powers, Jr.; Superintendent of Public Instruction, W. W. Jones; Commissioner of Public Lands, A. G. Kendall. Supreme Court: Chief-

Justice, George B. Lake; Associate Justices, Amasa Cobb and Samuel Maxwell.

Legislative Session.—The Legislature, containing 15 Republicans, 11 Democrats, 6 Anti-Monopolists, and one Greenbacker in the Senate, and 55 Republicans, 26 Democrats, 16 Anti-Monopolists, and 8 Independents in the House, convened on the 2d of January, and adjourned on the 26th of February. On the 4th of January, Gov. Dawes delivered his inaugural address, from which the following are extracts:

There is an evil of considerable magnitude which of late years has prevailed in many localities of our State, to the great injury of large numbers of our people. I refer particularly to the sale of fraudulent patent rights and of stock in fictitious corporations, by which unsuspecting persons have been induced to make worthless purchases, and give in payment their negotiable promissory notes, which, by a transfer to innocent holders, they were finally compelled to pay. There seems to be a well-founded doubt in the minds of many whether, in the present condition of our criminal law, such fraudulent practices can be reached and punished. I would, therefore, respectfully suggest the propriety of incorporating into the law a suitable provision remedying this defect.

Article XI of the Constitution, sections numbered four and seven, reads as follows:

"SECTION 4. Railways heretofore constructed, or that may hereafter be constructed in this State, are hereby declared public highways, and shall be free to all persons for the transportation of their persons and property thereon, under such regulations as may be prescribed by law. And the Legislature may from time to time pass laws establishing reasonable maximum rates of charges for the transportation of passengers and freights on the different railroads in this State. The liability of railroad corporations as common carriers shall never be limited.

"SECTION 7. The Legislature shall pass laws to correct abuses and prevent unjust discrimination and extortion in all charges of express, telegraph, and railroad companies in this State, and enforce such laws by adequate penalties to the extent, if necessary for that purpose, of forfeiture of their property and franchises."

These citations are made for the reason that I wish to bring before your minds the fact that by virtue of these provisions the people have reserved to themselves absolute power in all matters pertaining to the correction of abuses, extortions, or unjust discrimination on the part of railroads or other corporations.

On the 31st of January, Charles F. Manderson (Republican), on the seventeenth joint ballot, was chosen United States Senator. The vote was as follows:

C. F. Manderson, 75; J. H. Stichel, 20; James E. Boyd, 17; J. S. Morton, 14; C. H. Brown, 5; A. H. Connor, 1; D. M. Nettleton, 1. Total, 133.

Among the acts of the session were:

Joint resolution to Congress praying for the abolishment of tolls on the railroad-bridges spanning the Missouri.

Authorizing counties to issue bonds for refunding their bonded indebtedness, and provide for registering and certifying the same, and for levying a tax to pay interest and principal thereof.

To provide additional remedies for enforcement of judgments and orders for alimony and maintenance.

Amending section 4, chapter 55, compiled statutes, by adding the following: "Persons who can show documentary evidence that they have passed a satisfactory examination before medical boards of other States created for the purpose of such examination, and all surgeons or assistant surgeons who were com-

missioned and served as such in the late war of the rebellion."

Joint resolution to Congress requesting such legislation as will compel railroad companies to take out patents and pay taxes on lands granted them by the national Government.

For the security of guests and lodgers in hotels against injury by fire.

Apportioning the State into ten judicial districts.

Prohibiting the uttering of false pedigrees of stock. To protect butter and cheese manufacturers.

Requiring county treasurers to publish a tabulated statement of the affairs of the office in June, 1853, and January, 1854, and semi-annually thereafter.

For the incorporation of churches, parishes, and religious societies.

Amends section 11, chapter 50, compiled statutes, "Liquors." The amendment is the old section with the following added: "Provided, that any person or persons shall be allowed to sell wine made from grapes grown or raised by said person or persons on land belonging to or occupied by said person or persons in the State of Nebraska, the same to be sold in quantities not less than one gallon, without procuring the license provided for in this chapter."

Prohibiting extortion and discrimination in the transmission of telegraph dispatches.

Amending the Constitution in regard to the Legislature. Members will remain in office two years, and receive a salary of \$300, and ten cents mileage both ways. Regular sessions to continue sixty days. No bills to be introduced after the fortieth day, except in response to a special message from the Governor.

Prohibiting the fraudulent transfer of property.

To prevent beginning of round-up of cattle till after the 15th day of May.

To protect the health of female employes, by compelling employers to provide chairs for their female employes.

For the protection of inmates of the Hospital for the Insane; providing that every inmate shall be allowed to write one letter a week and have it posted without censorship of officers.

Appropriating \$50,000 for the erection of a new building, and for repairs and improvements of the Nebraska State Reform School. One-fourth-mill tax to raise money.

Capitol appropriation bill; provides for taking down the old building, and makes a half-mill tax.

Prohibiting the importation, selling, or running at large of domestic animals afflicted with any contagious disease.

Several bills for the regulation of railroads were introduced, but none was passed.

Party Conventions.—The Democratic State Convention met in Omaha, on the 29th of August. James W. Savage, of Douglas county, was nominated for Justice of the Supreme Court; and J. M. Woolworth, of Douglas, E. R. Daniels, of Madison, and G. W. Johnston, of Fillmore, for Regents of the University.

The platform declares against protective tariff, against prohibitory liquor laws, against encroachments of corporate capital, and against free passes.

The Republican State Convention met in Lincoln, on the 26th of September. The following is the ticket nominated: For Judge of the Supreme Court, M. B. Reese, of Saunders county; for Regents of the University (long term), Milton J. Hull, of Clay, and John T. Mallalieu, of Buffalo; for Regents of the University (short term), Jesse M. Hiatt, of Harlan, and Ed. P. Holmes, of Pierce.

The platform declares for protective tariff,

for a constitutional measure to prevent discrimination by railroad and telegraph companies, for the reclamation of lands granted to railroads but not earned by them, and approves the administration of President Arthur.

The Anti-Monopolists indorsed the Democratic ticket in part, and nominated David Butler, Amos Dean, and J. F. Merritt for Regents.

Election Returns.—At the election in November, the Republican ticket obtained a majority. The vote was as follows:

Reese, Republican.....	Judge.
Savage, Democrat and Anti-Monopolist.....	52,945
	47,195

REGENTS, LONG TERM.

Hull, Republican.....	56,331
Mallison, Republican.....	56,961
Daniels, Democrat.....	41,993
Butler, Anti-Monopolist.....	18,172
Woolworth, Democrat.....	31,097

REGENTS, SHORT TERM.

Hlatt, Republican.....	56,427
Holmes, Republican.....	56,445
Dean, Anti-Monopolist.....	34,464
Merritt, Anti-Monopolist.....	18,511

For District Judges, Democrats were chosen in the First and Seventh districts, and Republicans in the other eight.

NETHERLANDS, THE, a constitutional monarchy in Western Europe. The Constitution, proclaimed Nov. 8, 1848, vests the legislative authority in the States-General, composed of two chambers. The executive authority is exercised through a council of eight ministers.

The Government.—The reigning King is William III, born Feb. 19, 1817, who succeeded his father, William II, March 17, 1849. The heir-apparent is Alexander, Prince of Orange, born Aug. 25, 1851. The ministry is composed of the following members: Minister of Foreign Affairs, Dr. P. J. A. M. van der Does de Willebois; Minister of the Interior, Dr. J. Heemskerck Az; Minister of Justice, Dr. Baron M. W. du Tour van Bellinchave; Minister of Finance, W. J. L. Grobbee; Minister of the Colonies, F. G. van Bloemen Waanders; Minister of the Waterstaat, Commerce, and Industry, J. G. van den Bergh; Minister of War, Major-General A. W. P. Weitzel; Minister of Marine, Vice-Admiral F. L. Geerling.

In consequence of the Cabinet changes, the Stadtholder-General of the East Indies, Fredrik s'Jacob, resigned late in December.

Area and Population.—The area of the Netherlands, which are divided into eleven provinces, is 12,648 square miles. The population on Dec. 31, 1879, when the last census was taken, was 4,012,693. The computed population at the same date in 1882 was 4,172,971. The number of marriages in 1882 was 29,565; births, 153,900; deaths, 93,396. In 1879 the population was divided as to religion into 2,469,814 Protestants, 1,439,137 Catholics, 81,693 Israelites, and 22,049 of other faiths. The cities of over 100,000 inhabitants were: Amsterdam, with 350,201; Rotterdam, with 162,140; and the Hague, with 127,931.

Finances.—The following statement gives the expenditures and receipts as set down in the budget of 1883:

EXPENDITURES.	Guilders.
Royal household.....	750,000
Cabinet.....	625,161
Foreign Affairs.....	700,114
Justice.....	5,463,523
Interior.....	12,300,895
Marine.....	12,319,956
War.....	22,298,754
Public debt.....	80,381,294
Finance.....	8,493,915
Payment to communes.....	9,166,000
Worship.....	2,007,188
Colonial administration.....	1,152,572
Waterstaat, etc.....	19,102,071
Railroads.....	14,900,000
Total.....	189,265,967

RECEIPTS.

RECEIPTS.	Guilders.
Land-tax.....	10,955,770
Personal tax.....	10,416,000
Patents.....	4,198,400
Spirits.....	22,000,000
Other excise duties.....	17,175,000
Stamps, etc.....	24,790,000
Customs, etc.....	4,712,000
Plate and jewelry guarantee.....	311,100
Domains.....	2,100,000
Post-Office.....	4,650,000
Telegraphs.....	1,080,800
Lottery.....	480,000
Hunting and fishing licenses.....	145,000
Pilotage.....	1,002,000
Mining royalties.....	3,105
Railroads.....	2,121,000
Miscellaneous.....	4,561,525
Total.....	110,601,700

The expenditure for the colonies entered in the budget refers to the central administration of the West Indies and Surinam. The East Indies have a separate budget, voted by the States-General.

In 1883 the public debt amounted to 989,703,350 guilders, not including 10,000,000 guilders of paper money. The interest on the debt in 1883 amounted to 29,285,894 guilders; the sinking-fund charge to 1,045,400 guilders. The total amount of the debt in 1882 was 981,308,450 guilders. The new loan of 60,900,000 guilders was issued at 98½. A certain amount is to be paid off annually, after four years, the numbers of the bonds called being drawn by lot, and the whole extinguished in fifty-six years.

Army and Navy.—The army was reorganized in 1881 by introducing the German system of conscription. It is recruited partly by enlistment and partly by conscription. The conscripts remain with the colors twelve months, and, for the rest of their five years of service, are called out for six weeks annually. Besides the regular army, there is a militia, called the Schutterzen, divided into two classes, the active, composed of men between twenty-five and thirty-five years of age, and the sedentary, from thirty-five to fifty-five. The regular army numbered 2,326 officers and 62,684 men. Of the latter, 42,889 were infantry, 8,987 cavalry, 1,433 engineers, 13,291 artillery, and 441 special. The active Schutterzen numbered 28,600, and the sedentary 40,000 men.

The army of the East Indies is entirely dis-

tinct. It is recruited exclusively by enlistment among Europeans or natives. In 1882 the effective was 1,872 officers and 30,933 men, of which latter, 14,524 were Europeans and the remainder natives.

The navy in July, 1888, consisted of 23 ironclad vessels, 95 other steamers, and 20 sailing-vessels. The largest ironclad, the *Koning der Nederlanden*, has 8½-inch plates, and carries four 35-ton guns. It has two turrets, as has the *Prince Hendrik*, carrying four 12-ton guns, a ram of great speed. There are four other ram-bowed vessels ranked as first-class ironclads, all with a single turret, besides the *De Ruyter*, a monitor ram with a battery of 14 guns in a single turret. There are thirteen second-class ironclads, slow monitors intended for coast-defense, all built on the same model, with 5½ inches of armor and two 12-ton guns. In the East Indies are a number of armed steam and sail vessels in the maritime police service.

Commerce.—The total value of the special imports in 1881 was 865,568,000 guilders, as compared with 782,591,000 guilders in 1880; of the exports, 647,975,000 guilders, as compared with 582,684,000. Including the commerce with the Dutch colonies, the total imports in 1881 amounted to 919,671,000 guilders; exports, 690,885,000 guilders. Of the imports in 1881, 267,770,000 guilders came from Germany, 244,825,000 from Great Britain, 111,087,000 from Belgium, 60,753,000 from the United States, 58,022,000 from Java, 46,685,000 from Russia, 37,863,000 from British India, 20,942,000 from the German free ports, and 20,104,000 from France. Of the exports, 291,114,000 guilders went to the German Zollverein, 159,810,000 to Great Britain, 109,899,000 to Belgium, 42,092,000 to Java, and 16,860,000 to the United States. The imports of cereals in 1879 amounted to 166,200,000 guilders; exports, 108,800,000; imports of colonial produce, 85,000,000 guilders; exports, 32,700,000; imports of coal, 85,100,000 guilders; imports of metals, 108,200,000 guilders; exports, 66,900,000; imports of hides and leather, 25,800,000 guilders; exports, 24,100,000; imports of textile materials, 86,400,000 guilders; exports, 38,500,000; imports of yarns, 43,600,000 guilders; exports, 26,800,000; imports of textile fabrics, 84,700,000 guilders; exports, 21,100,000; imports of drugs, dyes, and chemicals, 66,900,000 guilders; exports, 54,100,000; imports of oils, etc., 49,700,000 guilders; exports, 31,900,000.

The mercantile marine consisted on Jan. 1, 1882, of 751 sailing-vessels, of an aggregate capacity of 615,602 cubic metres, and 86 steamers of 241,321 cubic metres.

Railroads.—The length of railroads in operation on Jan. 1, 1883, was 2,022 kilometres, or 1,260 miles, of which 1,056 kilometres belonged to the state, and 966 kilometres to private companies. The total earnings of the private lines in 1880 were 17,167,424 francs; expenses, 11,858,353 francs. The total outlay

on the Government lines up to June, 1881, was 176,339,544 francs.

Telegraphs.—The length of telegraph lines on Jan. 1, 1883, was 4,132 kilometres; length of wires, 15,486 kilometres; number of dispatches in 1882, 3,364,612, of which 2,009,297 were internal, 1,323,974 foreign, and 31,341 official. The receipts were 1,071,608 guilders; ordinary expenditures, 1,477,015 guilders; extraordinary, 102,395 guilders.

Mails.—The number of private letters sent through the post-office in 1882 was 45,978,611 domestic, and 13,850,420 foreign; postal-cards, 18,723,866; total, 78,552,397. The number of newspapers was 42,300,965. The receipts amounted to 4,590,540 guilders; expenses, 3,311,875 guilders.

Colonies.—The colonial possessions of the Netherlands have an aggregate area of 659,126 square miles, and contain a total population of 25,530,426.

The immigrant and European population of all the East India possessions, including that of Java, was in 1880 as follows: Europeans, 41,676; Chinese, 343,793; Arabs, 16,025; Hindoos and others, 9,119. The capital of the Dutch East Indies is Batavia, which had in 1880 96,957 inhabitants. Samarang contained 68,551; and Soerabaya, 122,234.

Java produces, for the benefit of the Netherlands, a large surplus revenue, after paying for its own government. Most of it is obtained by the sale of a vast amount of colonial produce, grown under the "culture system."

The budget for 1883 gives these receipts:

In Holland :	Guilders.
Sales of coffee	24,840,908
Sales of cinchona	145,085
Sales of tin	5,422,226
Railroads	1,165,000
Other receipts	715,581
In the East Indies :	
Sales of coffee	8,164,700
Opium	15,730,000
Leases of public lands	18,652,000
Customs	9,651,000
Salt duty	7,080,500
Posts and telegraphs	1,258,500
Railroads	8,156,000
Other receipts	30,231,992
Total	139,238,492

About one third of the annual expenditure is for the army and navy, and one third for the general administration, in Java and the Netherlands. The expenditure is stated at 24,388,492 guilders in Holland, and 123,811,629 guilders in the East Indies, making a total of 147,700,121 guilders, and showing a deficit of 8,461,629 guilders.

The exports of the Dutch East Indies in 1880 were of the total value of 176,954,000 guilders, of which 141,777,000 guilders were exported by private individuals and 37,177,000 guilders by the Government. The total exports in 1879 amounted to 175,745,000 guilders. The total imports in 1880 were 173,414,000 guilders, 157,474,000 on private and 15,940,000 on Government account, against the total of 154,652,000 guilders in 1879.

The aggregate tonnage of vessels entered in 1880 was 1,855,681; cleared, 1,779,805. The tonnage of the colonial fleet in 1880 was 146,-110 tons; in 1881, 143,817 tons.

The colony of Surinam, or Dutch Guiana, has an area of 46,060 square miles, and a population of 69,856. The West India islands belonging to Holland are: Curaçoa—area, 210 square miles; population, 24,507. Aruba—area, 69 square miles; population, 6,198. Bonaire—area, 95 square miles; population, 5,060. St. Martin—area, 17 square miles; population, 3,286. St. Eustace—area, 7 square miles; population, 2,258. Saba—area, 5 square miles; population, 2,202.

Ministerial Crisis.—In March the Van Lynden ministry, after an adverse vote, February 26th, of 68 to 2 votes on the proposition to reduce the limitation of the franchise, determined to hand in their resignation. The Opposition was made up of the Catholic and ultra-Protestant parties, and the object of the votes was to prevent the reform of the electoral laws which was demanded by all the Liberals. Dr. Heemskerck got together a Cabinet after several weeks. His own group counted only a half-dozen votes; but the Liberals were split into two irreconcilable factions. The new ministry was composed mostly of men outside of Parliament and not known to politics.

Legislation.—During the Cabinet crisis, legislation went on without interruption. The proposition for a new loan was approved, though the rate of interest was fixed at 4 instead of 3 per cent., as intended by the Government. The terms were so attractive that twelve times the 60,000,000 was subscribed. The North Sea fishery treaty, framed the previous year by a conference of the interested powers, was approved. The project of a new canal, to connect Amsterdam with the Rhine, was confirmed in the form proposed by the passage of an expropriation act. The new Conservative ministry applied themselves to the task of regulating the disordered finances of the country. The expenditures for the colonies were to be reduced, except those for Curaçoa, which are somewhat increased. It was proposed to revive the timber duties and increase the spirit and tea duties; but only a part of the new imposts were approved by the Chamber. The catastrophe in northern Java, and epidemics among human beings and animals in the East Indies, increased the difficulties of the Government.

The question of a revision of the Constitution was before the country, but the Liberals could not agree as to the extent of the reform. In the elections of half the members of the Second Chamber in June, the Liberals, who could not agree on the question, lost three seats, electing only 18, while the Conservatives elected 24 members. The two sections of the Left still commanded a majority in the Second Chamber. By the provincial elections, which were held later, the large Liberal majority in

the First Chamber was not diminished. The points in which the Liberals proposed to alter the Constitution were to make the law of succession to the throne clear and complete, to empower the Council of State to speak out independently in administrative affairs, to abolish the electoral cense and substitute an intellectual qualification, and to reduce the terms of representation, so that the States-General will be entirely renewed within the period of five years; further, the complete introduction of universal personal military service, the abolition of the oath, and an easier process for revising the Constitution. The new ministry upon assuming office appointed a commission to study the question of revision.

War in Atcheen.—The war in Sumatra was continued, and no important success was achieved by the Dutch soldiers. The natives were armed with excellent rifles, obtained from trading-vessels. The woods and hills of northern Sumatra were favorable for guerilla warfare. The leader of the rebels, the Rajah Njay Hassan, refused the terms which were offered, and demanded the return of the disputed territory, and the payment of 5,000 guilders.

(For an account of the International Exhibition at Amsterdam, see *WORLD'S FAIRS*.)

NEVADA. State Government.—The following were the State officers during the year: Governor, Jewett W. Adams, Democrat; Lieutenant-Governor, C. E. Laughton; Secretary of State, J. M. Dormer; Treasurer, George Tuflly; Comptroller, J. F. Hallock; Attorney-General, W. H. Davenport; Superintendent of Public Instruction, C. S. Young; Surveyor-General, C. S. Preble. Judiciary, Supreme Court: Chief-Justice, Thomas P. Hawley; Associate Justices, O. R. Leonard and C. H. Belknap.

Legislative Session.—The Legislature convened on the 1st of January, and adjourned on the 1st of March. Ninety-three laws were passed, among which were the following:

Consolidating Washoe and Roop counties under the name of Washoe.

Defining the rights of husband and wife.

For the prevention of fraud and the better protection of miners in the sale and purchase of ores.

To enable mining corporations to consolidate, and defining the manner of such consolidation.

Providing for the taxation of mines that produce a ton or less of ore or mineral-bearing material per day, and to encourage the prospecting of undeveloped mines.

Providing for the support of illegitimate children.

Providing for the licensing of traveling merchants or soliciting agents, commonly called drummers.

Providing for the consolidation of domestic and certain foreign corporations.

Granting the right of way and providing for the construction of the Nevada and Northern Railroad from Elko to the head-waters of the Owyhee river, and thence to the pine-forests of Oregon; like rights to the Nevada Southern Railroad, from Wells, Elko county, to the Colorado river.

For the better observance of the Sabbath.

The following proposed amendments to the Constitution are to be voted on at the election in November, 1884:

Section 2 of Article IV is amended, changing the time of the convening of the Legislature from the first Monday in January to the first Monday in February. This is for the purpose of giving the State officers an opportunity to prepare their reports, so that they will be ready for the Legislature when it convenes.

Section 1 of Article II is amended so as to require naturalized citizens to perfect their citizenship six months prior to the time of voting. This is evidently for the purpose of preventing political parties and candidates from defraying the expense of naturalization papers for such persons as do not care enough for the privilege of exercising the elective franchise to pay for themselves. It also disfranchises all persons convicted of the offense of selling their votes.

Article XVI is changed so as to render it necessary for constitutional amendments to be adopted only by one Legislature instead of two consecutive ones, before submitting them to the voters for ratification. It requires, however, the vote of two thirds of the members of each House instead of a bare majority, as under the present system. The article is further amended by fixing the minimum number of members of a Constitutional Convention at one half the membership of both branches of the Legislature, instead of the aggregate number, as it now stands.

Section 8 of Article XI is amended so as to permit the proper board to invest the funds accruing from the sale of State lands for educational purposes in the bonds of other States, instead of restricting them to United States and Nevada State bonds, as at present.

The question of calling a Constitutional Convention will also be submitted at the same time.

Finances.—The Comptroller estimated the amount of expenditures necessary for the fiscal year 1883-'84 at \$307,550.68. Of this the amount dependent on taxes, exclusive of the amount of deficiencies for 1882, will be:

For ordinary current expenses.....	\$490,800 00
For public schools—five-cent tax.....	27,000 00
Tax for State interest and sinking fund.....	94,000 00
Total amount dependent on taxes.....	\$551,800 00

The appropriations made by the Legislature at this year's session amounted to \$470,300.

The amount of taxable property in the several counties, as returned by the county assessors to the State Comptroller for the years 1882 and 1883, was \$27,369,335.37 in 1882, and \$27,857,656.68 in 1883.

The State tax, 90 cents on each \$100 in 1882, was \$246,328.99; in 1883, \$250,718.91.

At the beginning of the year the State had \$381,127.08 in coin on hand; the State school fund had \$576,617.50 in first-class securities; the University fund, \$56,780, also in good securities; the public debt amounted to \$336,587.50. The receipts for 1881 were \$302,435.74, and expenses \$346,917.01. In 1882 the receipts were \$303,445.94, and expenses \$286,842.66. For the two years there was an excess of \$27,868.99. The assets of the State school fund are shown to be \$622,008.85.

RECAPITULATION OF EXPENSES.

Legislative.....	\$58,873 58
Executive.....	87,500 09
Judicial.....	24,042 00
Printing.....	14,008 79
Public buildings.....	9,516 87
State-Prison.....	70,320 18
Charities.....	73,248 81
Schools.....	54,754 29
Interest on State debt.....	25,120 00
Redemption of State bonds.....	24,000 00
Invested funds.....	155,899 45
Miscellaneous.....	26,943 72
Total.....	\$571,981 88

The total valuation of real property for the year was \$18,845,868.01; of personal, \$8,912,804.80; a total of \$27,728,172.81, and an increase of \$388,737.44 over 1882. On this valuation the State received a tax of \$249,823.56, and the several counties \$614,552.05, a total of \$864,375.61.

The receipts from the sale of State lands amounted to \$93,462.78.

The net yield of bullion, upon which taxes were paid, was \$1,648,407.89, upon which the total tax collected was \$57,572.40, of which the State received \$14,790.52, and the counties \$42,781.88.

Mining.—The following is the bullion product by counties for 1882:

COUNTY.	Gold.	Silver.
Churchill.....	\$50,000	\$30,000
Elko.....	35,000	500,000
Esmeralda.....	50,000	1,470,000
Eureka.....	385,000	1,700,000
Humboldt.....	350,000	80,000
Lander.....	20,000	1,000,000
Lincoln.....	25,000	430,000
Nye.....	25,000	230,000
Storey and Lyon.....	920,000	560,000
White Pine.....	40,000	460,000
Washoe.....	10,000	17,000
Totals.....	\$2,000,000	\$6,750,000

The bullion yield for 1883 was \$7,487,634.25.

State Institutions.—Provision for the insane was made by the enactment of a law, approved Feb. 24, 1881, providing for the erection and equipment of a State Insane Asylum at Reno, and appropriating \$80,000. The building has been completed.

In July, 1882, the State patients in the asylum at Stockton, Cal., 148 in number, were transferred to the new asylum. The number of patients, Nov. 1, 1883, was 149. The number of convicts in the State-Prison on November 30 was 117. The average attendance at the State University during 1882 was 28.

The following table gives the number of children of school age by counties:

COUNTIES.	COUNTIES.		
Churchill.....	89	Lyon.....	515
Douglas.....	386	Nye.....	214
Elko.....	918	Ormsby.....	1,790
Esmeralda.....	227	Storey.....	2,655
Eureka.....	808	Washoe.....	1,060
Humboldt.....	472	White Pine.....	368
Lander.....	618		
Lincoln.....	498	Total.....	9,518

The population of the State has decreased since 1880.

Railroad Incorporations.—During the years 1881 and 1882 nine certificates of incorporation were filed by railroad companies in this State. This is the list:

Nevada Western; California Central, Nevada Division; Salt Lake and Western; Nevada Midland; Nevada and Oregon; Carson and Colorado, Second Division; Eureka and Colorado River; Battle Mountain and Lewis; Salt Lake and Western.

Election Returns.—The following is the vote cast in November, 1882:

OFFICES.	Republican.	Democratic.
Governor.....	6,885	7,770
Lieutenant-Governor.....	7,862	6,906
Secretary of State.....	7,787	6,570
Comptroller.....	7,451	6,523
Treasurer.....	7,654	6,683
Attorney-General.....	7,131	7,116
Superintendent of Schools.....	7,551	6,742
State Printer.....	7,800	6,559
Surveyor-General.....	7,512	6,776
Supreme Judge.....	7,728	6,545
Clerk of Supreme Court.....	7,668	6,626
Congressman.....	6,462	7,720

Of the seven district judges chosen, the Republicans elected six and the Democrats one. The Legislature has 12 Democrats and 8 Republicans in the Senate, and 27 Republicans and 18 Democrats in the House; Republican majority on joint ballot, 10.

NEW BRUNSWICK, an eastern province of the Dominion of Canada. Area, 27,322 square miles; population in 1881, 821,233. Capital, Fredericton.

Towns.—The towns of importance in New Brunswick, and their population, are: St. John, 26,127; Portland, 15,226; Fredericton, 5,218; Moncton, 5,032; Chatham or Miramichi, 4,600; Newcastle, 4,000; Carleton, 4,000. The chief town, St. John, at the mouth of St. John river, conducts over two thirds of the entire trade of the province. Portland is a suburb of St. John. Fredericton, the capital of the province, is on St. John river, 84 miles from the bay. Vessels ascend far above Fredericton, steamers running as far as Woodstock, a small town in Carleton county, near the Maine border. Moncton is the junction of the St. John branch of the Intercolonial Railway with the main line. The workshops, etc., of the railway are here. It is also a port on Petitcodiac river.

Soil.—The valley of the St. John river, the shores of Northumberland straits, and of the Bay of Fundy, are, on the whole, fertile and very well fitted for agriculture and grazing. The northern districts are rocky and very thinly peopled. Agriculture is not conducted on even an ordinary scale, the product being little more than enough for home consumption.

Climate.—The climate of this province is very genial along the shores of the Bay of Fundy and the Gulf of St. Lawrence, but inland extremes of summer heat and of winter cold are often experienced. The most northern point is in latitude 48°, and the most southern about latitude 45°. The waters of the Gulf Stream moderate the climate of the southern part somewhat, and this modification is assisted by the continuous flow and ebb of the tides in the bay. These tides rise to very great heights in the inlets or "guts" along the shores—sometimes attaining the extreme of sixty-five feet.

Ports.—The ports of New Brunswick are: Dalhousie, Bathurst, Cavagnet, and Shippegan, engaged in the timber and fishing trade, on the Bay of Chaleur; Chatham, Newcastle, Richibucto, Shediac, on the Gulf of St. Lawrence and Northumberland straits. The first

two are lumbering and ship-building towns, the last two are packet-stations for Prince Edward Island, as well as ship-building and lumbering ports. Moncton and Hillsboro, on the Petitcodiac; Dorchester and Sackville on Shedpody and Cumberland bays, are ship-building, lumbering, and coal stations. Campo Bello, St. George, St. Andrews, and St. Stephens, on Passamaquoddy Bay, are lumbering, ship-building, and general commerce stations, trading largely with Calais, in Maine, on the boundary. St. John has already been noticed. Fredericton has a large river trade as well as the timber business.

Industries.—Lumber is the chief export and source of wealth. The total of all exports of New Brunswick products in 1882 was \$6,599,881, of which \$4,724,422 was lumber. The fisheries rank next, the exports of New Brunswick fish amounting to \$753,251. This is chiefly on account of dried and fresh herring, and of lobsters. Including the two departments, agriculture and grazing, the farming exports amounted in 1882 to \$578,420, nearly all of which went to the United States. The exports of manufactured articles for the year in question amounted to \$365,743. This sum is made up chiefly of extract of hemlock-bark, \$129,812; ships, \$101,840; grindstones, \$30,438; wooden manufactures, \$27,053; gypsum, \$10,430; and junk and oakum, \$15,543. The exported minerals amounted to \$140,908. Of this, \$35,561 represents coal; \$20,140, crude gypsum; \$19,689, iron-ore; \$4,733, antimony-ore, and \$57,684, stone and marble.

Education.—The present system of free public schools in New Brunswick exists under the provisions of the Common-Schools Act of 1871, and of several acts since passed by the provincial Legislature. This enactment had for its object "the establishment throughout the entire province of a well-equipped system of schools, in which the instruction should be open to the children of poor and rich alike; the quality of the instruction good enough for all; and the general character of the instruction non-sectarian and national.

Almost from the day New Brunswick became a separate province (1784) the Legislature had recognized the duty of fostering the work of education, and the statute-book from time to time gave evidence that the importance of placing the means of instruction within reach of every child was more and more clearly perceived. The greatest step in advance, previous to 1871, was made by the passage of the Parish Schools Act of 1858.

The administration of the school law and regulations, and the general supervision of the schools, are vested in the Chief Superintendent, subject to the Board of Education, of which he is a member. The Board of Education, which is the ultimate authority, under the law, in all matters relating to public schools, is composed of the Governor, the members of the Executive Council, the President of the

University, and the Chief Superintendent of Education—twelve in all.

The whole province is divided by the Board of Education into small districts for local school government. The salaries of teachers are paid in part by the Chief Superintendent of the Provincial Treasury and in part by the trustees. School-buildings and grounds may be paid for by loans extending over a limited period, and poor districts are specially aided by the Board of Education in providing buildings. The law provides for the efficient grading of schools wherever the number of pupils in the district is sufficient. Besides the schools supported and governed as above detailed, there are fourteen county grammar-schools, located in most cases in the shire-towns. Except in the city of St. John, pupils of both sexes attend the same schools and departments.

“The place occupied by the normal school in our school system has no counterpart in any school system of any other province or State on this continent, unless it be in that of Prince Edward Island. It is not, like the normal schools of Nova Scotia, Ontario, and the American States, an adjunct of the system; it is central and vital to it. It is not the head, but in respect of agency by which the quality of school instruction is to be guaranteed even to the extremities of the province, it is the heart of the system.” Thus spoke the chief superintendent, Dr. Rand, in his address at the opening of the new building erected for the institution at Fredericton. The building provides ample accommodation for about 200 student-teachers, and for the four Model School departments with about 200 pupils.

The proportion of the population at school, in the summer term of 1881, by the census of the year, was 1 in 6.18. The average monthly percentage of pupils daily present during the term was 72.44. The number of teachers and assistants employed was 1,453, of whom 1,239 had received normal-school training. The number of schools in operation was 1,386; the number of pupils enrolled that term was 51,921, and for the whole year 64,267. The average number of teaching days the schools throughout the province were in session was 101½, out of 108 teaching days in the term. Total provincial grant for education, for the year ended April 30, 1882, \$153,085. Total of county fund drafts in the same year, \$88,068.

The College of New Brunswick was established by provincial charter in 1800; founded and incorporated by royal charter in 1823, under the name of King's College, Fredericton, with the style and privileges of a university; reorganized under an amended charter in 1860, and denominated the University of New Brunswick. The university derives certain revenues from lands and other property originally granted by the province; it also receives an annual legislative grant of about \$9,000. The Faculty of Arts consists of five professors, and the course occupies three years.

NEW HAMPSHIRE. State Government.—The following were the State officers at the close of the year: Governor, Samuel W. Hale, Republican, succeeding Charles H. Bell; Secretary, Ai B. Thompson; Treasurer, Solon A. Carter; Attorney-General, Mason W. Tappan; Superintendent of Public Instruction, James W. Patterson; Insurance Commissioner, Oliver Pillsbury; Railroad Commissioners, Orren C. Moore, E. B. S. Sanborn, and Edward J. Tenney. Supreme Court: Chief-Justice, Chas. Doe; Associates, Clinton W. Stanley, Isaac N. Blodgett, Wm. H. H. Allen, Isaac W. Smith, Lewis W. Clark, and Alonzo P. Carpenter.

Legislative Session.—The Legislature convened on the 6th of June, and adjourned on the 15th of September. On the 7th of June Gov. Hale was inaugurated. On the 2d of August, and on the forty-third ballot, Austin F. Pike, Republican, was chosen United States Senator, by a vote of 181 to 112 for Harry Bingham, Democrat, and 22 for others. In both branches, 424 bills were offered, of which 201 failed to pass; and 66 joint resolutions, of which 19 failed to pass. Among the acts and joint resolutions passed were the following:

- To establish a new apportionment for the assessment of public taxes.
- To promote the welfare of the common schools.
- In relation to uniting, separating, forming, dissolving, or changing the lines of school districts, in amendment of chapters 43 and 86 of the general laws.
- In relation to holding of teachers' institutes.
- To aid Dartmouth College in furnishing instruction for indigent students from New Hampshire.
- In relation to savings-banks. By it the charters of all savings-banks in the State incorporated for a term of years are made perpetual.
- Providing for the compensation of the bank commissioners.
- To incorporate the New Hampshire Life Insurance Company.
- To prevent fraudulent divorces.
- For the better registration of births, marriages, and deaths.
- To prohibit the sale of toy pistols and other toy fire-arms.
- For the punishment of parents who neglect to provide for the support of their minor children.
- To facilitate the detection and punishment of crime.

The railroad consolidation bill was passed, under the title of “an act to provide for the establishment of railroad corporations by general law.” The act affects thirty-four railway lines operating exclusively inside of New Hampshire, and eight other lines. The principal feature of this act is to authorize any two or more, or all of the said railway lines, to consolidate by perpetual leases, or partnership-contracts, into one corporation. It authorizes also the building of new railroads, and the taking of private property therefor, whenever and wherever a railway corporation chooses to do so. These things, besides the fixing and mortgaging the capital stock, and other matters, the act allows the railway companies to do, “provided the Supreme Court of the State, or three referees appointed by the court, shall decide that the public good requires such new

railroad, or that the public good will be promoted by the proposed union." "An act to establish a Board of Railroad Commissioners" was also passed.

Among the joint resolutions passed by the Legislature of 1883 was the following:

"Relating to a Constitutional Convention." It provides that, at the November election in 1884, the electors shall vote on the question, "Is it expedient that a convention be called to revise the Constitution?"

Finances.—During the fiscal year ended May 31, 1883, the State revenue from all sources amounted to \$935,675.72, and the expenditures for all purposes to \$792,286.11; leaving in the treasury, on June 1st, an available cash surplus of \$204,622.49; such surplus, on June 1, 1882, having been \$61,233.48. This favorable result is due to the recently adopted system of biennial sessions of the Legislature.

The State debt on June 1, 1883, was \$3,388,060.94. As to a portion of its principal, amounting to \$450,000, and falling due on Sept. 1, 1884, the Governor observes that, unless large sums of the public money are appropriated for extraordinary expenses in the mean time, it may be paid at maturity with the surplus of revenue over expenditures accumulated in the interval.

Railroads.—The following is a list of the railroads operating in New Hampshire, the value of each road, and the tax assessed on it for the present year:

NAMES OF RAILROADS.	Value of road and equipments.	Amount of tax.
Eastern	\$425,000	\$4,227 95
Boston and Maine	1,500,000	17,848 41
Ashmetot	150,000	1,835 05
Boston, Concord, and Montreal	2,500,000	30,290 43
Fitchburg	18,000	204 72
Yankee and Lowell	400,000	4,577 28
Wilton	250,000	3,091 75
Cheshire	1,200,000	13,921 07
Grand Trunk	550,000	6,704 00
Northern	2,000,000	24,559 87
Concord	2,500,000	29,312 63
Manchester and North Wear	73,000	914 92
Concord and Portsmouth	475,000	5,858 40
Dover and Winnepesaukee	850,000	4,221 60
Portsmouth, Great Falls, and Conway	875,000	4,527 29
Manchester and Lawrence	1,500,000	18,601 58
Concord and Claremont	465,000	5,725 29
Sullivan County	500,000	6,004 70
Worcester and Nashua	180,000	2,074 05
Mount Washington	180,000	1,807 71
Suncook Valley	140,000	1,694 18
Portland and Rochester	15,000	185 50
Monsadnock	100,000	1,224 78
Portland and Ogdensburg	50,000	618 85
Wolfborough	48,000	584 09
		\$190,870 47

The aggregate amount of the tax assessed on railroads in the State for 1883 is nearly \$21,000 greater than for 1882, when it was \$170,003.85. The excess is almost entirely attributed to the increased rate of taxation.

Savings-Banks.—The number of savings-banks in operation in the State, on June 1, 1883, was sixty-six; the two oldest were chartered in 1823. The deposits amount to \$39,124,000;

the total assets exceeding \$40,000,000, and the number of depositors being 118,187.

In the matter of savings-banks, the last Legislature enacted some important changes, the better to provide for the interests of depositors, the principal one relating to the commissioners. Their number is reduced to two; and their compensation, which was previously paid by the banks, is now made payable by the State, at the rate of three dollars a day of actual service, besides the allowance of ten cents mileage. At the same time, the new law imposes on the commissioners a more exacting and more responsible service than was required of them before.

Insurance.—The total of fire-risks carried in the State, during 1882, was \$69,987,572, and that of life-risks, \$11,950,766. The system of insurance supervision now obtaining in the State was established in 1870, and the totals of premiums which her citizens have paid since then to the insurance companies of either sort during these thirteen years are of an almost equal amount, namely: for fire insurance, \$5,998,286.90; for life insurance \$5,978,545.24. The losses paid to the citizens of the State in that time aggregate: fire, \$3,172,802.45; life, \$2,657,519.04. The aggregate premiums collected in New Hampshire by the fire-insurance companies of other States in 1882 amounted to \$470,484.22, and the losses paid by them in the same year were \$480,168.94. The New Hampshire Fire Insurance Company collected \$60,176.67 of premiums in the State during that year, and paid \$30,344.21 of losses. The life-insurance companies, all of other States, collected in New Hampshire \$288,317.03 of premiums, and the losses paid by them amounted to \$269,588.97. The fire and life insurance companies of other States, for the business transacted in New Hampshire during the year 1882, paid into her treasury \$7,578.57 of taxes; and the New Hampshire Fire Insurance Company paid into it a tax of \$2,600 on its capital stock.

Education.—The State Normal School, in operation since 1870, has since then graduated 400 pupils, a yearly average of 80. The present number of pupils is 40. The location of it is regarded as a serious drawback to its success. The Governor recommends the establishment of a second Normal School in the northern section of the State.

Respecting public instruction in the State generally, Gov. Hale points to the impediments to its efficiency and diffusion resulting from the district system, and decidedly subscribes to the opinion of the ablest educators that the change from that to the town school system can not be too soon effected.

State Charities.—The Asylum for the Insane during the year has been under a new superintendence, whose management the trustees aver to have been marked by ability and devotion. The present number of its inmates is 254. During the forty years of its existence, the

number of patients admitted into the asylum was 4,423, and that of patients discharged as recovered, 1,593.

The number of indigent persons who belong to other unfortunate classes, and whom the government of New Hampshire keeps as its beneficiaries in institutions of other States, is as follows: Twenty deaf and dumb at the American Asylum in Hartford, Conn., two at the Clarke Institute in Northampton, and two at the Horace Mann School in Boston, Mass. Of blind persons, there are ten at the Perkins Institution for the Blind in South Boston; and at the Massachusetts School for the Feeble-Minded the State keeps three beneficiaries. For the education of the deaf-mutes the State pays annually \$175 per capita.

Correctional Institutions.—In the State Industrial School, opened twenty-five years ago, for the correction of wayward youth, there were at the beginning of June 110 inmates—boys, 92; girls, 18. The total number received in this institution since its establishment is 1,100, of whom two only died of disease.

The State Penitentiary contains 121 prisoners, all males except one. No escape from it has occurred during the past thirteen years. Owing to the diminished number of prisoners who might be employed at work, the results of the labor-contract system in 1882 were not so satisfactory for the prison's income as before. The earnings amounted to \$16,845.19, and the expenditures to \$20,366.20, leaving a deficiency of \$3,522.

Legal Reform.—Concerning the present system of the State laws, the Governor lays before the Legislature several of its defects, both in substance and procedure, and earnestly urges their immediate correction. In regard to some among such defects he says: "Theoretically, the Executive Department is responsible for the administration of the laws, the officers directly charged with prosecutions being the Attorney-General and the county solicitors; but it is a fact that, outside of the law reports, and the fragmentary chronicles of the newspapers, there is no published report whatever of the administration of either criminal or civil laws." He suggests that the Legislature should provide for an annual report by the county solicitors to the Attorney-General, and for a report by the Attorney-General to the Governor. The legal proceedings which are now used in the State, with regard to the relations existing between debtors and creditors, the Governor characterizes as subject to manifest and frequent injustice.

Divorce.—In regard to divorces, the Governor plainly says that during the past forty years their number has steadily and alarmingly increased, in proportion to the increased number of the causes for which the Legislature has successively allowed them to be granted. He says: "Of the fourteen causes for which divorces may be granted in this State, there are

five that render the marriage relation a matter of option, and under cover of which it is robbed of all its obligation and solemnity."

NEW JERSEY. State Government.—The following were the State officers during the year: Governor, George C. Ludlow, Democrat; Secretary of State, Henry C. Kelsey; Treasurer, George M. Wright; Comptroller, Edward J. Anderson; Attorney-General, John P. Stockton; Superintendent of Public Instruction, Ellis A. Apgar. Judiciary, Supreme Court: Chief-Justice, Mercer Beasley; Associate Justices, Manning M. Knapp, Edward W. Seuder, Bennet Vansyckel, David A. Depue, Alfred Reed, Jonathan Dixon, Joel Parker, William J. Magie. Court of Errors and Appeals, the Chancellor, the Justices of the Supreme Court, and Lay Judges: John Clement, Martin Cole, Caleb S. Green, William H. Kirk, William Paterson, Jonathan S. Whitaker; Chancellor, Theodore Runyon; Vice-Chancellors, Abraham V. Van Vleet and John T. Bird.

Legislative Session.—The Legislature met on January 9th, and adjourned on March 23d. On January 24th, John R. McPherson, Democrat, was re-elected United States Senator, by a vote of 43 against 36 for Garret A. Hobart, Republican, and 2 for Gov. Ludlow. Among the acts of the session are the following:

Enabling corporations incorporated under special charter to increase the amount of their capital stock, and also the number of their directors; an act which enables horse railroads to increase their capital stock to double the present amount; relating to the consolidation of docks and stores for the keeping of live-stock; an act providing for the cancellation of defective conveyances made by attorneys and agents; supplement to an act to appoint harbor-masters and inspectors, approved March 31, 1869, which provides that no ship or vessel shall be anchored within 300 yards of the end of a pier extending from the shore of New Jersey into the waters of New York Harbor, between Ellis Island and Castle Point, in Hoboken, and requires all harbor-masters to enforce the law; authorizing the Governor to appoint six persons to constitute a Board of State Charities and Correction, of which the Governor shall be president.

There were filed in the Secretary of State's office, of Senate bills, 97 bills and 2 joint resolutions approved; 2 bills passed over the veto and 1 bill filed without approval—total, 100 bills and 2 joint resolutions; and of the House bills, 108 bills and 4 joint resolutions approved.

The Legislature provided for the limiting of the hours of labor of children.

Finances.—The accounts are divided and kept under the four headings of Agricultural College Fund, the Deaf and Dumb Fund, the School Fund, and the State Fund. The Agricultural College fund consists of \$116,000 of State bonds. The Deaf and Dumb fund consists of \$58,793.58, derived from the sale of the Stevens Battery, and appropriated by the Legislature to the Institution for the Deaf and Dumb. There has been expended from this amount \$45,000, leaving \$13,793.58. The school fund amounts to \$3,285,767.11. The securities of the State fund consist of stock of the Camden and Amboy Railroad and Delaware and Raritan canal companies, with a

par value of \$288,700. This stock pays 10 per cent. interest. The receipts during the last year (excluding the items not to be counted on in the future) amounted to \$861,702, and the ordinary disbursements were \$1,051,901. "The receipts of the State," says Gov. Ludlow in his message to the Legislature of 1884, "should be increased to \$1,000,000 per annum. The sum derived from the taxation of railroads should be at least \$750,000; tax on foreign insurance companies, \$5,000; State-Prison receipts, \$75,000; interest and dividends, \$29,000; judicial fees, by an amendment to the law which will meet the difficulties shown in the Comptroller's report, should produce \$30,000; the item of official fees may safely be put down at \$13,000; assessments on corporations, \$25,000; a tax should be levied on telegraph and express companies, which now pay nothing, and would produce at least \$20,000; a small tax on corporations, other than those already taxed as such, should be levied, with the result of at least \$100,000."

The report of the Commissioners of the Sinking Fund show that the assets of the fund are as follow :

Loans on mortgage	\$438,954 99
Interest accrued thereon	11,454 54
Decreases against real estate	27,529 92
United States bonds (par value)	50,000 00
New Jersey bonds (par value)	11,000 00
School-district bonds (par value)	5,000 00
Balance in bank	62,608 21
Total	\$682,547 66
Real estate, costing	425,659 18
Total	\$1,068,206 84

By the supplementary report it is shown that the fund will probably be exhausted by 1893, leaving \$800,000 unprovided for.

The investment in railroad property in this State, as stated by the Commissioner of Railroad Taxation, is \$227,884,584. Almost the entire amount is withdrawn from the ordinary assessment-rolls of the municipalities, and is taxed under a special system, at one half of one per cent. upon its true value, and the tax is paid directly into the State treasury. The tax levied upon the railroads of this State the last year was \$677,557.76, or less than one third of one per cent. upon the amount invested. Other property in the State is taxed at rates varying from one to three per cent.

The commissioners have prepared a schedule of the riparian lands of the State, and show that, out of 4,452,750 lineal feet, the State has disposed of but 500,708. The commissioners attribute the ready sale of these lands to the reasonable prices charged for them, ranging from twenty cents per lineal foot, on unimproved beaches, to fifty dollars on the Hudson river and Bay of New York.

State Institutions.—The number of convicts in the State Prison at the beginning of the year was 798, and at its close 804—87 females and 767 males. The receipts and expenditures of the past year were as follow :

Paid for maintenance	\$62,439 88
Paid for repairs	4,500 73
Paid for salaries of officers and inspectors	9,000 00
Paid for salaries of deputies	56,209 64
Paid for discharged convicts	1,800 00
Total	\$133,478 19
Earnings of prisoners	72,706 88
Net loss to the State	\$60,766 81
Net loss previous year	61,168 27

The number of inmates of the Reform School for Boys has increased slightly over that of last year, being 380 as against 322. The law of 1882, providing for an appropriation of not exceeding \$100 a year for the maintenance of each inmate, has worked well. Four hours of each day are devoted to school and to exercise, and the remainder to employment on the farm, in the workshops, or at the brick-yard. The boys earned, last year, \$19,816.04, nearly half the cost of maintenance.

There were in the Industrial School for Girls, at the close of the year, 27 inmates, of whom twelve were received during the year. The trustees claim, that of the 185 girls committed since 1871, over 100 have been reclaimed.

The report of the officers of the Trenton Asylum shows that the number of patients on October 31st was 627, two less than the preceding year. The expense of maintaining the institution during the past year was \$156,281.81, of which \$44,326.18 was received from the State; \$83,274.73 from the counties; and \$25,448.72 from private patients. The institution owns 65 acres of farm-land, and rents 170 more.

The Morristown Asylum reports 707 patients at the close of the year, an increase of 40 since the last report. The expense of maintaining the institution was \$196,624.96, of which \$39,675.91 was received from the State; \$38,800.84 from the counties; and \$57,840.48 from private patients.

The number of the inmates of the Home for Disabled Soldiers at the beginning of the year was 339; there were 291 admitted during the year, and 474 discharged. The total number under care was 680.

During the year, the organization of the New Jersey Institution for the Deaf and Dumb was completed and the building occupied. As the law organizing the institution provided that the course of instruction should be five years, the admissions into the new institution were limited to those pupils who had received instruction for less than that time. They numbered 66, which with 18 original admissions makes the number in the institution 84. It can comfortably accommodate 175 pupils.

Education.—There were raised and appropriated for school purposes during the year the following amounts :

State school-tax	\$1,375,699 20
State appropriation	100,000 00
Township school-tax	24,585 72
Interest from surplus revenue	88,004 49
Local tax for teachers' salaries	974,560 89
Total	\$1,567,849 60
Local tax for school-houses	507,752 81
Total	\$2,075,602 61

The number of children of school age in the State is 349,242, and there are 211,905 pupils enrolled in the several public schools, and 48,707 attend private schools. The school property of the State is valued at \$6,515,620, and affords accommodation for 194,456 pupils; the cost of each pupil, on a basis of the average attendance, is \$15.14 a year.

The managers of the Normal School report 218 pupils enrolled during the year; the number of pupils graduated was 39.

The Agricultural College is supported entirely by the proceeds of the land given by the General Government, and by the liberality of Rutgers College, to which it is attached; the State is under no expense in regard to it, and, of the 60 students in attendance, 38 are enjoying State scholarships.

Statistics.—In 1880 there were 7,167 establishments whose total capital was \$112,421,593, employing 87,145 persons, whose wages aggregate \$46,408,045. The total value of products was \$255,925,236.

The leading industries are as follow (the first column of figures shows the number of establishments of each, the second gives the capital employed, and the third the value of the products):

Silk and silk goods	103	\$6,952,325	\$17,122,290
Iron and steel	40	9,099,050	10,841,896
Sugar and molasses.....	4	2,110,000	\$2,841,258
Meat-packing, etc.....	81	1,775,200	20,719,840
Foundry and machine-shops.....	188	7,481,431	11,282,748
Flour and grist-mill products.....	491	8,579,068	8,450,944
Cotton and cotton goods..	24	8,961,145	5,089,519
Drugs and chemicals.....	41	8,830,750	4,908,965
Malt liquors.....	40	8,260,800	4,532,788
Jewelry.....	63	2,555,699	4,079,677
Woolen goods.....	37	2,580,125	4,984,007

Under the various "bounty laws" there have been paid upon "flax-stalks" \$5,000 for 858 bunches, and upon "flax-fiber" \$4,000 for 155 bunches. The bounty paid upon 5,595 tons of sorghum-cane grown was \$5,595, and for 319,944 pounds of sugar made from sorghum, \$3,199.45.

Northern Boundary.—The commissioners appointed by the States of New York and New Jersey, to locate the northern boundary line of this State, have concluded their labors. Their work was limited to a remarking of the line that was run in 1774, by the restoration of such of the monuments as had been destroyed or injured. This work has been thoroughly done, and in a manner to insure stability.

Party Conventions.—The Democratic State Convention met in Trenton, September 18th, and nominated Leon Abbett, of Jersey City, for Governor. The platform declares in favor of a tariff for revenue "so adjusted as to give protection and encouragement to home productive industry and labor, without producing or fostering monopolies"; and demands "the equalization of taxes on all properties within the State, whether that of individuals or corporations."

The Republican State Convention met also in Trenton, on September 18th, and nominated Judge Jonathan Dixon for Governor. The platform commends President Arthur's administration, declares for a protective tariff, and demands "such a prudent and economical administration of the affairs of the State as will make needless any direct State tax."

Nominations were also made by the Greenbackers and Prohibitionists.

Election Returns.—The vote in November was as follows: Democratic, 103,856; Republican, 97,047; Prohibition, 4,153; Greenback, 2,960. The Legislature, to meet in 1884, will consist of 12 Republicans and 9 Democrats in the Senate, and 84 Democrats and 26 Republicans in the House.

NEW JERUSALEM CHURCH. The General Convention of the New Jerusalem Church in the United States met in its sixty-third session in Boston, Mass., June 1st. The Rev. Chauncey Giles was chosen President. Reports were made from the local associations, as follows: Canada Association, five societies; Maine Association, five societies; Maryland Association, four societies; Massachusetts Association, twenty-one societies, 1,497 members; Michigan Association, 124 members; Minnesota Association, Missouri Association, New York Association, 664 members; Ohio Association, eleven societies, 556 members; General Church of Pennsylvania, seven societies, 359 members; Illinois Association, and from a number of single societies, besides which several evangelists and missionaries reported upon the progress of their labors. The endowment fund of the Theological School was reported to be now \$21,780. The receipts of the Board of Missions had exceeded those of the previous year by \$349. A single missionary was actually employed by the board, in Middle Tennessee, but other missionaries were aided by it, in different parts of the United States and in Italy and Sweden. The trustees of the "Lungerich fund" for the publication and distribution of the works of Swedenborg reported that their income for the year had been \$1,439, and their expenditure \$2,626, and that a balance remained in their hands of \$33,322. Sixty-seven thousand books had been distributed to the date of making the report. The German Missionary Union had supplied books and tracts to fifteen societies. Reports were presented by the Committee of Correspondence from the Italian mission (where considerable success had been gained in Sicily, and twenty volumes of new church books had been published in Italian), from East Prussia, Denmark, Sweden, and Switzerland. An address was read from the Australasian Conference, which consists of four societies, "and hopes to meet once in three or four years." Stress was laid in the discussions of the Conference upon the importance of the publication of the works of Swedenborg in Latin, for which a fund, called the "Latin fund," had been set apart. This fund was intrusted to the Ameri-

can Swedenborg Printing and Publishing Society, to be used for the gratuitous circulation of the Latin editions.

The English Conference.—The seventy-sixth meeting of the English Conference of the New Church was held in London in August. The Rev. Chauncey Giles and the Rev. Louis Tafel were present as visiting delegates from the United States. Reports were presented of sixty-three societies, having 5,490 registered members of more than twenty years of age, and 6,597 Sunday-school pupils, with thirty-five ordained ministers and fifteen licentiates. Missionaries of the church were working successfully in Germany, Poland, Denmark, Sweden, and Switzerland. The present meeting of the Conference was attended with especial interest, because the year was marked by the one hundredth anniversary of the foundation of the New Church in England, which occurred on the 5th of December, 1783. The fact was remembered in the Conference, and was commemorated in a special service.

NEW MEXICO. Territorial Government.—The following were the Territorial officers during the year: Governor, Lionel A. Sheldon; Auditor, Trinidad Alarid; Treasurer, Antonio Ortiz; Secretary, William G. Ritch; Commissioner of Immigration, Gilbert Scudder. Supreme Court: Chief-Justice, Samuel B. Axtell; Associates, Joseph Bell and Warren Bristol.

Present Condition.—According to the census of 1880, the Territory had a little over 119,000 people. Since that time the increase has been large. Along the lines of railroads the old towns show considerable growth, many new ones have been founded, and all have the appearance of activity and thrift. Ranchmen have settled all over the Territory in large numbers. New mining camps have been established, and reduction-works are being erected. The law imposes a poll-tax on each able-bodied male inhabitant over the age of twenty-one years, and the returns of the assessors of the various counties show the number of such persons to be over 32,000. About three fourths of the population are natives of the country, and speak the Spanish language. But the spread of the English language is rapid, especially in the towns. New Mexico has an admirable climate, great natural resources, an orderly condition, and a population, especially the natives, kindly and hospitably disposed. It lacks a thoroughly systematized government; the methods in vogue are an admixture of common and civil law systems.

Resources.—There are 8,000,000 acres of land adapted to the production of fruits, vegetables, and cereals, and water is convenient and sufficient for purposes of irrigation. These lands are highly productive, but the methods of cultivation are far behind the times. Wheat of the finest quality can be raised. The greatest wealth of the Territory lies in its minerals. These comprise gold, silver, copper, lead, iron, and zinc, and coal is abundant. Development

has been slight, and reduction-works are few, though recently a greater impetus is manifest. During the year 221,270 tons of coal, of an average value of \$3 a ton, were mined. There were nearly 500 men employed in coal-mines.

Finances.—In 1881 the taxable property of the Territory amounted to \$14,088,554; in 1882 it advanced to \$20,441,395; and in 1883 to \$27,137,908. Except the Atlantic and Pacific, all the railroads in the Territory are exempt from taxation for a period of six years from completion, and none have been completed for so long a time. One per cent. is levied upon the taxable property—one half for the Territory, one fourth for county purposes, and one fourth for schools. At the end of the year the Governor expected the Territory would be out of debt, and would have a respectable surplus on hand.

Railroads.—Some progress has been made in the construction of railroads. The Atlantic and Pacific is finished across Colorado river, which furnishes an additional connection with the Pacific coast. A narrow-gauge road has been completed from Deming to Silver City, in Grant county, 46 miles; another from Lordsburg, on the Southern Pacific, to Clifton, Arizona, 30 miles of which are in New Mexico; and a third is partly constructed from Santa Fé to Española, 84 miles, connecting with the Denver and Rio Grande.

Education.—The greatest want of New Mexico is a proper school system. A law passed at the last session of the Legislature authorizes the establishment of charitable schools for indigent orphan children, the management being confided to the Governor and the archbishop. Schools are established for nearly one hundred children, which make no distinction on account of religious opinions, and are divided between Catholics and Protestants in substantially fair proportions. The Legislature at the same session also passed an act authorizing the creation of separate school districts in seven of the counties of the Territory by a vote of the people. Under this law the districts may regulate their own schools. The law contemplates compulsory attendance for five months of the year, but it is not executed. The census of 1880 shows that the greatest percentage of illiteracy in the United States is in New Mexico.

Land System.—On this subject the Governor expresses the following views:

New Mexico is largely plastered with grants of land, real or pretended, made by the Spanish and Mexican Governments. By law these grants are segregated from the public domain, and must continue in a condition of practical mortmain until final action is taken to determine their validity. The claimants do nothing to develop, or improve, or pay taxes on them, and a satisfactory title can not be acquired by others. In some cases the grants overlap, which leads to disputes, and occasionally to acts of violence. Confirmations have been carelessly made, and it is generally believed that errors and frauds have been practiced, and apparently legalized, through want of knowledge of, or attention to, the subject. Grants have been confirmed of greater dimensions than the Spanish or Mexican

laws seem to justify, and though mineral lands were not alienated in fee-simple by those governments, still confirmatory acts have been passed and patents issued, under which it is claimed that minerals pass to patentees. Success in securing confirmation of grants of a doubtful character so encouraged and emboldened the covetous, that it is alleged the manufacture of grant-papers became an occupation, and surveys have been so erroneously made as to lead to a belief that these grants are endowed with India-rubber qualities. No one will attempt to acquire any lands in the vicinity of these alleged grants, for fear that the stretching process will be applied. Prospectors avoid the grants because it is assumed that, in accordance with the practice in former confirmations, the minerals will pass to the claimants. Doubt and uncertainty seriously retard settlement and development. More than a third of a century has passed since this Territory was acquired, and still large numbers of the grants remain undisposed of.

The homestead and pre-emption laws were designed to distribute lands among the people, and to prevent land monopoly. In those localities where the great body of the land is productive of the necessaries of life, the intended result has been experienced. In the dry and mountainous country the contrary effect has been produced, and under the operation of the homestead and pre-emption laws the greatest land monopoly exists. Locations are made which embrace a spring, or extend along a stream, and the surrounding lands are valueless to any one but the locators of the water. Hence, the man who obtains one hundred and sixty acres controls the usufruct of a vast tract without cost, and without paying any tax to support the local government. A cattle company or an individual may, by owning a few acres, have the occupancy of a tract as large as some of the States.

Indians and Outlaws.—On these subjects the Governor, in his report for 1883, says:

At the time my last report was made, Oct. 31, 1881, New Mexico had recently been relieved from prolonged and destructive raids by hostile Indians. Since that time no raids have been made into the Territory, and no citizen has been killed on the soil of New Mexico, except Judge McComas and wife, which occurred in April last. The Indians then did not enter the Territory for the purpose of a raid, but were driven into it from Arizona by the forces in pursuit, and murdered the persons named while fleeing from the troops, and making their way by a circuitous route into Mexico. Preparations are so complete, and means so ample, that any hostile movement can be met, and crushed speedily and effectually.

Also, at the time my last report was made, the Territory in many parts was overrun by numerous desperate and criminal characters. Life and property were at their mercy, and they acted in defiance of the authorities. The condition was so bad, that good citizens felt justified in organizing vigilance committees, and lynch-law was frequently administered. The desperate and thieving element has substantially disappeared, and nothing more is heard of *vigilantes*, or lynch-law. Thirty militia companies are organized, armed, and officered by good men, under excellent discipline, and as favorably located over the Territory as the condition of the population will permit.

NEW YORK (STATE). Grover Cleveland, who was elected Governor in November, 1882, by an unprecedented majority, was inaugurated on the 1st of January. On the following day the Legislature was organized. The organization of the Senate, as made the year before, was left undisturbed, except that the new Lieutenant-Governor presided. Alfred C. Chapin, of Kings county, was chosen Speaker of the Assembly. For the first time in many

years the Democratic party had control at once of the chief executive office and both branches of the Legislature. There were several contested seats in the Assembly, but only one case excited special interest. In one of the election districts of the Thirteenth Assembly District of New York city, 178 votes were returned as cast for Thales S. Bliss, Democrat, and 120 for Henry L. Sprague, Republican. It was claimed in behalf of Sprague that the figures had been transposed through an error of a poll-clerk, which reversed the result of the election in the entire Assembly district. The county canvassers had refused to correct the error, and given the certificate to Bliss. The Assembly Committee on Privileges and Elections, consisting of five Democrats and four Republicans, reported, after a full investigation, in favor of Sprague's right to the seat, seven members signing the report. Two members of the committee, without disputing the facts established by the majority, reported in favor of Bliss, and after debate this minority report was adopted, 14 Democrats voting with the Republicans against the motion.

Legislative Action.—A subject which occupied a good deal of attention during the session was that of convict-labor, an effort being made to abolish the employment of inmates of the State Prisons by contract. An investigation of the alleged abuses of the system was made by a committee of the Assembly, and at one time thirteen bills affecting the subject were pending. A bill was passed forbidding the renewal of the contract for making hats at the Clinton Prison, but beyond that the system was not interfered with. An act was passed, however, near the end of the session, referring the question whether contract-labor should be abolished from the prisons to a vote of the people at the next regular election.

Two important acts affecting the civil service of the State were passed. One of these prohibited assessments for political purposes upon persons holding office or employment in the service of the State, or the collection of contributions for political purposes in any public office or institution. Although this act became a law, the same object was still more effectually provided for in the other bill, the main purpose of which was to regulate appointments to and removals from office. This bill was prepared under the advice of the New York Civil-Service Reform League, and was modeled on the national law. It was introduced simultaneously by a Republican in the Senate and by a Democrat in the Assembly, on the 25th of January. It was referred to the Judiciary Committees, whence it was favorably reported in the Assembly February 28th, two Democratic members of the committee dissenting. It was not acted on until April, when, through the efforts mainly of Republican members, it was brought under consideration, amendments having been added from another bill, which extended its provisions somewhat. When

on the 1st of May a motion was made in the Assembly to lay aside all orders of business having precedence, for the purpose of taking up this measure, it was defeated by a strict party vote, the Democrats opposing it. Later, on the same day, however, the same measure was adopted by a vote of 75 to 17, and the bill was ordered to a third reading by a *viva-voce* vote. It was finally passed with little opposition in either house, though the long delay was attributed to covert hostility.

The first section authorized the Governor to appoint, and the Senate to confirm, three Civil-Service Commissioners, not more than two of whom shall be adherents of the same party. These commissioners were to constitute the New York Civil-Service Commission, and were to hold no other official place under the State of New York. The Governor may remove any commissioner if he sees fit and appoint his successor with the consent of the Senate. The duties of the commissioners are to aid the Governor, as he may request, in preparing suitable rules for carrying the act into effect. As regards these rules, it is specified that they shall provide as follows:

1. For open, competitive examinations for testing the fitness of applicants for the public service now classified or to be classified.
2. All the offices, places, and employments so arranged or to be arranged in classes shall be filled by selections from among those graded highest as the results of such competitive examinations.
3. There shall be a period of probation before any absolute appointment or employment aforesaid.
4. Promotions from the lower grades to the higher shall be on the basis of merit and competition.
5. No person in the public service is for that reason under any obligation to contribute to any political fund.
6. No person in said service has any right to use his official authority or influence to coerce the political action of any person or body.
7. There shall be non-competitive examinations when competition may not be found practicable.
8. Notice shall be given in writing by the appointing power to said commission of the person selected for appointment or employment from among those who have been examined. And any necessary exceptions from said eight fundamental provisions of the rules shall be set forth.

The commissioners, who were to have a salary of \$2,000 a year each, were authorized to appoint a chief examiner with a salary of \$3,600, a secretary, stenographer, messenger, etc., making the entire annual expense of the commission about \$15,000. It was provided that

Within four months after the expiration of the present session of the Legislature, it shall be the duty of the Governor to cause to be arranged in classes the several clerks and persons employed or being employed in the public service, for the purposes of the examination herein provided for, and he shall include in one or more of such classes, so far as practicable, all subordinate places, clerks, and officers in the public service of the State. After the termination of eight months from the expiration of the present session of the Legislature, no officer or clerk shall be appointed, and no person shall be admitted to or be promoted in either of the said classes now existing, or that may be arranged hereunder pursuant to said rules, until he has passed an examination or is shown to be specially exempted from such examination, in conformity herewith. No elective officer, and no person merely employed as a laborer or workman, shall be required to be classified hereunder; nor, unless by the direction of the Senate, shall any person who has been nominated for confirmation by the Senate be required to be classified or to pass an examination.

Other sections of the bill authorized the

mayors of cities having a population of 50,000 or more to prescribe regulations for admission to the civil service of such cities in accordance with the principles of the law; prohibited political assessments upon office-holders or public employes, and the offering of any inducement for appointment to or retention in office; and provided for an investigation by the commission into the conditions of the public service throughout the State, and the expediency of further legislation, having for its purpose an extension and fuller application of the system of competitive examinations. The bill received the prompt approval of the Governor. A bill of a similar character, applicable to the city of New York alone, was defeated in the Assembly. (See REFORM IN THE CIVIL SERVICE.)

The act regulating primary elections which was passed in 1882, and applied only to the city of Brooklyn, was so modified as to apply to all the cities of the State, and in that form was enacted. It provides that any person who at any political primary election falsely personates and votes under the name of another, or obstructs or prevents others from voting who are entitled to vote, or fraudulently conceals or destroys ballots in the ballot-box, or takes ballots therefrom, or commits any other fraud tending to defeat or affect the result of the election, shall be deemed guilty of a misdemeanor. Before entering upon their duties the presiding officer and inspectors of the primary shall take the same oath now required of inspectors at general elections. The vote of any challenged person shall be rejected unless he be sworn as to his qualifications as a voter. It is made a misdemeanor for any person elected a delegate at such primary to accept money or valuable thing for his vote as such delegate.

A subject upon which much time was bestowed to no purpose was the amendment of the charter of the city of New York. On the 30th of January a resolution was adopted in the Assembly asking the mayor of that city to inform that House "what legislation, if any, he may consider necessary in order to economize, simplify, and improve the local government of the city of New York." The mayor replied on the 7th of February, submitting a scheme of charter amendment, the fundamental idea of which was to establish single heads for the administrative departments of the city, and give to the mayor full power of appointing and removing these. This plan was strongly supported and persistently advocated, but it was antagonized by powerful political influences; opposition schemes and amendments were presented, and finally the whole effort for charter reform was defeated.

Another subject which occupied a good deal of time and occasioned much controversy, was a project for increasing the water-supply of the city of New York, by means of a new aqueduct and an enlarged reservoir in the Croton basin. A carefully prepared bill for this purpose was introduced. It placed the charge of laying out

the line of the new aqueduct, securing plans, making contracts, and supervising the whole work, in the hands of a commission, and the controversy arose out of the method of appointing the commissioners. At first it was proposed that the Mayor, Comptroller, President of the Department of Taxes and Assessments, President of the Board of Aldermen, Commissioner of Public Works, and two citizens to be appointed by the mayor, should constitute the commission. This was modified so as to make the Mayor, Comptroller, and Commissioner of Public Works the official members. Then it was proposed to have four citizen members appointed by the mayor. This was strenuously opposed by some of the city representatives, who favored naming the commissioners in the bill. After much controversy it was decided that there should be only three citizen commissioners, and these were named in the bill, being James C. Spencer, George W. Lane, and William Dowd. All effort to secure the addition of a fourth citizen commissioner, or to have any power of selection left to the mayor, was defeated. The issue throughout was between those who wished to prevent political control over the aqueduct-work, and those who were credited with a desire to have such control, and the latter were successful. An effort was made, after the close of the session, to induce the Governor to veto the bill, but on the 1st day of June he gave it his approval, filing a memorandum of his reasons, which were mainly that there was urgent need of the new aqueduct, and he saw no evidence of the political jobbery alleged. The support given to the bill in the form in which it became a law was almost wholly Democratic, and the opposition was entirely Republican. (See *NEW YORK CITY*.) A bill was also passed authorizing the Commissioners of the Sinking Fund of the City of New York to investigate the merits of a scheme for obtaining a supplementary water-supply under high pressure from the Ramapo valley, in Orange and Rockland counties, and if convinced of the advisability thereof, to contract on behalf of the city, for the use of water thus to be supplied. One of the conditions provided for was that, within two years after the contract was entered into with the company proposing to construct the works, not less than 50,000,000 gallons per day of pure and wholesome water should be furnished, under a pressure due to a head of at least 300 feet above tide-water.

A bill requiring the elevated railroads in the city of New York to reduce their fares to five cents for each trip at all hours of the day passed both houses after much agitation. In the Assembly it was passed by a vote of 109 to 6, and in the Senate the vote was 24 to 5. It was nevertheless vetoed by the Governor after a hearing given to the advocates and opponents of the measure. The Governor argued at some length that the act was unconstitutional, because a contract had been entered into allow-

ing the companies to charge the existing rates of fare under the sanction of past legislation. The power of the Legislature to reduce fares under the General Railroad Act was limited by the condition that it could not be done without the consent of the corporations when it would reduce the profits to less than 10 per cent. of the "capital actually expended." This the Governor also regarded as a contract of the State, the obligation of which would be impaired by the bill. He furthermore believed that it would involve a breach of faith, inasmuch as liberal inducements had been necessary, and had been offered, to secure rapid transit in New York, and the rates of fare allowed were an essential part of the consideration under which capital had ventured into the enterprise. An effort to pass the bill over the veto was unsuccessful. The Railroad Commissioners were then called on to report upon the amount of capital "actually expended" in the construction of the elevated railroads, and the ratio of their profits to such expenditure. Two reports were submitted on the 19th of April, one signed by Commissioners Rogers and Kernan, and the other by Commissioner O'Donnell. The companies claimed that the cost of construction was \$30,646,659.27, but they included discount on bonds and other items which the commissioners did not regard as properly belonging to that account. They made deductions which left the "total cash cost" at \$22,688,258.14. The capitalization of the companies was found to be: Manhattan Railway Company stock, \$18,000,000, of which nothing was ever paid in; New York Elevated Railroad Company stock, \$6,500,000; Metropolitan Railroad Company stock, \$6,500,000; New York Company's funded debt, \$8,500,000; Metropolitan Company's funded debt, \$12,818,000; total, \$47,318,000. The commissioners did not regard the stock of the Manhattan Company as representing in any sense "capital actually expended." The gross income for the year ending Sept. 30, 1882, was stated at \$5,973,888.41, of which \$3,212,589.03 was derived from the lines of the New York Company, and \$2,755,483.62 from the lines of the Metropolitan Company. The operating expenses were \$1,794,871.83 for the roads of the New York Company, and \$1,796,684.88 for those of the Metropolitan. Taxes and interest on funded debt left the net income at \$352,069.37. Mr. O'Donnell did not agree with his colleagues as to the definition of capital expended and net income. He found the total capital actually expended on the entire elevated system to be \$22,250,608.72, and the net income to be \$2,375,910.54. He held that the roads are built under special charters; that the Legislature could amend, alter, or repeal these charters, and that there was no contract between the city or State not to reduce the fare. Mr. O'Donnell concluded by recommending the passage of a law fixing the "five-cent hours" on the elevated roads at from 4 to 10

A. M. and 3 to 9 P. M. He also proposed a law requiring the Railroad Commissioners to examine and ascertain the cash capital actually expended in the constructing and equipping of each surface railroad in the State, including street railways. Neither bill was passed.

A general act regulating the establishment of street railways was passed, but encountered a veto after the close of the session. The objection to it was that it secured special privileges for certain projects already existing in the city of New York.

A bill providing for submission to a vote of the people of a constitutional amendment prohibiting the manufacture and sale of intoxicating liquors was discussed in the Senate, and defeated by a vote of 18 yeas to 18 nays, only one Democrat voting in the affirmative, and two Republicans in the negative. The only change made in the excise laws was one affecting the cities of New York and Brooklyn alone. This was effected by a bill prepared by the delegations of those two cities, modified on suggestions made by the Governor after it had been submitted for his approval. The changes suggested by the Governor were in the direction of careful restriction, but the act as passed was much more liberal toward the liquor-traffic than the existing law which applied to the State generally. It abolished the requirement that holders of licenses should be hotel-keepers, permitted their removal from one place to another without losing their licenses, and forbade their arrest for violation of the law, except upon a warrant based on affidavits, unless engaged in selling on Sunday.

An act was passed regulating the conduct of receivers in winding up the business of insolvent corporations. Its chief features were that applications for the appointment of receivers should be made at a special term of the Supreme Court in the judicial district in which the principal office of the corporation was situated, that the compensation of receivers should be limited to 5 per cent. on the first \$100,000 received and paid out, and 2½ per cent. on all sums in excess of that amount; that the funds received should be deposited at one or more designated places, and that reports should be made to the court every six months, with detailed accounts of receipts and expenses. Restrictions were also put upon the employment of counsel, and a limit was fixed to the time for closing up the business of receiverships.

A proposition to submit to the people a constitutional amendment making legislative sessions biennial was defeated in the Assembly by a majority of one.

A bill apportioning the congressional representation of the State into thirty-four districts was passed, against the opposition of the Republican minority, who claimed that it was unfair, especially in the city of New York.

The first district was made to include the counties of Suffolk, Queens, and Richmond; Kings county was divided into four districts;

New York county below the Harlem river was divided into eight districts; that portion lying north of the river was joined to Westchester county to form the fourteenth district.

The other districts are as follow :

Fifteenth District.—The counties of Orange, Rockland, and Sullivan.

Sixteenth District.—The counties of Putnam, Dutchess, and Columbia.

Seventeenth District.—The counties of Ulster, Greene, and Delaware.

Eighteenth District.—The counties of Renasolaer and Washington.

Nineteenth District.—The county of Albany.

Twentieth District.—The counties of Saratoga, Schenectady, Montgomery, Fulton, and Hamilton.

Twenty-first District.—The counties of Clinton, Essex, Warren, and Franklin.

Twenty-second District.—The counties of St. Lawrence and Jefferson.

Twenty-third District.—The counties of Onondaga and Lewis.

Twenty-fourth District.—The counties of Otsego, Herkimer, and Schoharie.

Twenty-fifth District.—The counties of Onondaga and Cortland.

Twenty-sixth District.—The counties of Broome, Chenango, Madison, and Tioga.

Twenty-seventh District.—The counties of Oswego, Wayne, and Cayuga.

Twenty-eighth District.—The counties of Tompkins, Chemung, Seneca, and Schuyler.

Twenty-ninth District.—The counties of Ontario, Steuben, and Yates.

Thirtieth District.—The county of Monroe.

Thirty-first District.—The counties of Livingston, Genesee, Orleans, and Wyoming.

Thirty-second District.—The First, Second, and Third Assembly Districts of the county of Erie.

Thirty-third District.—The county of Niagara and the Fourth and Fifth Assembly Districts of the county of Erie.

Thirty-fourth District.—The counties of Chautauqua, Cattaraugus, and Allegany.

A bill extending the scope of investment for the funds of savings-banks met with strong opposition, in which the trustees of a majority of the savings-banks in the State united, and was vetoed by the Governor. Among other important measures which failed was one regulating charges for elevating grain, one reducing the fees of pilots in New York Harbor, and one increasing the number of surrogates in New York county to three.

New Offices and Officials.—A number of bills were passed during the session, providing for new offices and making changes in those previously existing, and a number of new appointments were made. At the beginning of the session, the Governor appointed as Railroad Commissioners, under the act of 1882, William E. Rogers, John D. Kernan, and John O'Donnell. The last mentioned was designated by the commercial organizations named in the act, and was the candidate of the so-called anti-monopolists. There was considerable opposition to him exhibited in the Senate, but the appointment was finally confirmed by a vote of 23 to 8, the confirmation in the other cases being unanimous. Later in the session, on the expiration of the term of office of Insurance Superintendent Charles G. Fairman and Bank

Superintendent A. B. Hepburn, John A. McCall, the deputy superintendent, was appointed to the former place, and Willis S. Paine, of New York city, to the latter. Mr. William B. Ruggles was elected by the Legislature Superintendent of Public Instruction, to succeed Neil Gilmour; James Shanahan was appointed Superintendent of Public Works, to succeed Silas B. Dutcher, in January.

Early in the session a bill was introduced providing that the completion of the new Capitol be placed in the charge of a single commissioner, to be appointed by the Governor. This passed, against the opposition of Republicans, in both houses. In the Senate it was declared by the Lieutenant-Governor to have passed, although a constitutional quorum did not vote, the Republicans abstaining, though present. The ruling that the visible presence of a quorum was sufficient, though not shown by the vote, caused much criticism on the part of the opponents of the Lieutenant-Governor. The salary of the new office was fixed at \$7,500, and later on the Governor appointed Isaac G. Perry, of Binghamton, to the position. The custody of the completed public buildings of the State was changed and placed in the hands of the Governor, Lieutenant-Governor, and Speaker of the Assembly, who had the selection of the Superintendent, by whom all subordinate employes were selected. Charles B. Andrews, of Buffalo, was appointed superintendent after the close of the session.

An act was passed providing for a commission of five persons, to be appointed by the Governor, to take all necessary preliminary action for the selection and appropriation of lands about Niagara Falls as a "State reservation," the object being the preservation of the natural scenery, and the protection of public rights therein. The commissioners were to receive no compensation, but their expenses in the discharge of their duties were to be met by the State. William Dorsheimer, J. Hampton Robb, and Andrew H. Green, of New York, Martin B. Anderson, of Rochester, and Sherman S. Rogers, of Buffalo, were appointed to the commission.

In pursuance of authority granted by a constitutional amendment ratified in 1882, an act was passed providing for the election of twelve additional justices of the Supreme Court, two in the first, fifth, seventh, and eighth districts respectively, and one each in the second, third, fourth, and sixth districts.

The office of Canal Appraiser and the body known as the State Board of Audit were abolished, and a Board of Claims was created to hear and decide upon all cases involving claims against the State for compensation or damages. The board was to consist of three commissioners appointed by the Governor, with the consent of the Senate, to hold office after their first appointment for a term of two, four, and six years respectively, and thereafter for terms of six years. Each commissioner was allowed

a salary of \$5,000 per annum and necessary expenses, not exceeding \$500. The board was authorized to appoint a clerk at a salary of \$2,000, a stenographer at \$1,500, together with five cents a folio for minutes furnished to claimants, and a messenger at \$800. The board was required to hold at least four regular sessions a year at Albany, beginning on the second Tuesday of January, April, September, and November respectively. All the necessary powers of a court of record were given to the Board of Claims, before which the Attorney-General was required to appear in behalf of the State. Appeals were allowed to the Court of Appeals from any final award on questions of law only when the amount in controversy exceeded \$500. The commissioners appointed to this new board were George M. Beebe, of Sullivan county; Henry F. Allen, of Buffalo; and Lyman H. Northrup, of Sandy Hill.

An act was passed abolishing the Board of Harbor-Masters for the Port of New York, and establishing a new one, the members of which were to be appointed by the Governor, with the advice and consent of the Senate, and to be paid salaries instead of being permitted to collect fees for their services, a practice which had been declared unconstitutional. Another act reorganized the Board of Emigration, and placed it in charge of a single commissioner, to be appointed by the Governor, with the consent of the Senate, who was to receive a salary of \$6,000 per year, and be allowed two deputies of his own selection, one with a salary of \$4,000 and the other with a salary of \$2,500 per year. On the last day of the session, May 4th, the Governor transmitted to the Senate a list of appointments, including those for Harbor-Masters, Port-Wardens, Quarantine Commissioners, and Captain of the Port of New York. The name of William H. Murtha, of Kings county, had previously been sent in for the new office of Commissioner of Emigration. The appointment was opposed by those Senators from New York affiliated with the Tammany organization, and the new appointments were also distasteful to them. The names sent in for Civil-Service Commissioners under the new law, which were those of Andrew D. White, Augustus Schoonmaker, and Henry A. Richmond, were promptly confirmed, as was that of C. F. Peck, for Chief of the Bureau of Labor Statistics, also a newly created position, but those for Harbor Commissioners, Port-Wardens, and Quarantine Commissioners were sent to standing committees, where that for Emigration Commissioner was already "hung up." As the Legislature was to adjourn that day, this action was equivalent to rejecting the nominations. The Governor sent a message to the Senate, which gave rise to a heated discussion, in which Senator Thomas F. Grady criticised the action of the Executive. The latter was as warmly defended by Senator Jacobs, of Kings county. The essential portion of the message was this:

I deem it my duty to remind you of the importance of giving effect to the law lately passed by the Legislature "to amend the laws relating to alien immigrants and to secure an improved administration of alien immigration." The statute was the result of investigation which demonstrated that the present management of this very important department is a scandal and a reproach to civilization. The money of the State is apparently expended with no regard to economy, the most disgraceful dissensions prevail among those having the matter in charge. Barefaced jobbery has been permitted, and the poor immigrant, who looks to the institutions for protection, finds that his helplessness and forlorn condition afford the readily seized opportunity for imposition and swindling.

As a result of the failure to confirm the appointment of a Commissioner of Emigration, the old board continued in power. There was some controversy as to the right of the harbor-masters to continue their functions, but it was not brought to an actual contest, and they continued as though no change had been made in the law. The question of calling an extra session of the Senate to dispose of these appointments was agitated for a time, but the Governor was not disposed to take that course, and renew the controversy.

Political Canvass.—The political canvass of the year presented no features of exceptional interest. The State officers to be chosen were, Secretary of State, Comptroller, Treasurer, Attorney-General, and State Engineer and Surveyor, and both branches of the Legislature were to be renewed. The advantage which the Democrats had gained by their sweeping success in 1882 was somewhat offset by the conduct of the Legislature in creating new offices and increasing public expenses. The differences among the Republicans had subsided, and the action of the party was generally harmonious, while the Democrats were more or less divided, especially in the city of New York. The consequence was a marked reaction, as shown in the result of the election.

The first convention of the year was held by the National Greenback Labor party at Rochester, on the 4th and 5th of September. The most important features of the platform were the following:

That railroads and telegraphs are public institutions, deriving their existence under the fundamental law of eminent domain, or right to take private property for public use; that under that law no legislative sanction can constitutionally confer on companies owning such property a right to tax commerce or travel, to pay interest or dividends on fictitious capital, or to make such property a source of private gain beyond a reasonable remuneration for services actually rendered, and a fair return on the money actually and in good faith expended by stock and bond-holders for its construction and equipment. . . . That pooling associations which allow railroad officials representing roads outside of the State to have a voice in determining transportation charges between points in the State are an outrage on the citizens, and should be prohibited by law. . . . That the outrageous contract prison-labor system still remains in force, notwithstanding the pledge contained in the platforms of the old parties to correct it, showing that no reliance can be placed in either to remedy the evil. We hold that prisons should be located on the mineral lands owned by the State in northern sections; that the prisoners should

be employed in developing the mineral resources of the State, so that their labors will not come in competition with the products of honest mechanics' toil, and that the prisoners should be paid for all they earn in excess of the actual cost of their keeping; and that the ballot-box is the only place through which American working-men can strike and obtain permanent relief from their present wrongs.

The ticket put in nomination was as follows: For Secretary of State, Thomas K. Beecher, of Chemung county; Comptroller, G. L. Halsey, of Otsego county; Attorney-General, Louis F. Post, of New York county; State Treasurer, Julian Winne, of Albany county; State Engineer, Edwin A. Stillman, of Ontario county.

The Republican State Convention met at Richfield Springs, on the 19th of September. Secretary of State Joseph B. Carr, Comptroller Ira Davenport, State Engineer and Surveyor Silas Seymour, and Attorney-General Leslie W. Russell were renominated, and Pliny T. Sexton, of Wayne county, was nominated for State Treasurer. The essential features of the platform were as follow:

We rejoice in the successful inauguration of civil-service reform, a result of Republican agitation and national progress, and insist that the work thus auspiciously begun be prosecuted to complete success.

We favor a system of tariff laws under which, while revenue for the Government is provided, American producers are justly protected, American labor elevated, and home markets are secured to home products for the advantage alike of the producer and laborer.

We favor the removal of all unjust burdens upon American shipping, and the awarding of ocean-mail contracts to the lowest bidders among owners of American vessels after open competition.

The tendency to create monopolies requires checking by adequate legislation. Unjust discrimination in transportation should be prohibited.

The free-canal policy of this State has in practice justified its adoption by restoring the canals to their usefulness.

We approve the plan of party reorganization in the city of New York.

The Democratic State Convention met at Buffalo. All efforts to secure unity in New York city had failed, and the Tammany and Irving Hall organizations refused to take part in common primaries as recommended by the State committee.

When the convention met, on the 26th of September, each of the three city factions appeared with separate delegations. There was considerable contest against the admission of the Tammany delegates, but the question was settled in advance by the State Committee, by deciding on a division of the representation on the basis adopted the previous year. This was done in the committee by a vote of 22 to 10. The following is the full report of the Committee on Resolutions:

The Democracy of New York reaffirms the platform adopted at its last State Convention, which has received the approval of the people, as shown by a majority of nearly 200,000 at the last election, and they especially denounce the proposition that the people should be taxed to raise a surplus fund for the Federal Government to distribute among the States. We claim with pride and satisfaction that every pledge therein made has been in good faith redeemed. Valuable re-

forms have been wrought; useless offices have been abolished; the civil service has been freed from the debasing and injurious influences of partisan manipulation; the freedom and purity of primaries have been secured; political assessments have been abolished; receivership abuses have been corrected; the principle of local self-government has been adhered to; the efficiency of the National Guard has been increased; taxation for the support of Government has been reduced; a State Bureau of Labor Statistics has been established; the rights of the working-man have been further protected, and the injurious competition of convict-labor has been curtailed. Business methods have been the rule in the management of State affairs. On the record thus made, and to which it will steadfastly adhere, the Democratic party asks a renewed award of the confidence of the people. We invite with reason all friends of improved State administration, irrespective of party, to join with the Democracy in preserving and perfecting the reforms in progress and in extending them to all branches of the State service. We heartily indorse Gov. Cleveland's administration. It justifies the great vote which elected him. He has deservedly won the affection of the people by his industry, firmness, intelligence, and aggressive honesty. The results make his administration one of the best the State ever had.

The nominations were as follow: For Secretary of State, Isaac H. Maynard, of Delaware county; Comptroller, Alfred C. Chapin, of Kings county; Treasurer, Robert A. Maxwell, of Genesee county; Attorney-General, Dennis O'Brien, of Jefferson county; Engineer and Surveyor, Elnathan Sweet, of Albany county.

The Prohibition party held a convention at Syracuse on the 26th of September, and nominated: For Secretary of State, Frederick Gates, of Herkimer county; Comptroller, Stephen Merritt, of Rockland county; State Treasurer, James Baldwin, of Steuben county; State Engineer, George A. Dudley, of Ulster county; Attorney-General, Virgil A. Willard, of Allegany county.

The platform declared the well-known principles of the party, and favored an amendment of the State Constitution prohibiting the manufacture and sale of intoxicating liquors.

The Election.—The election occurred on the 6th of November. The total vote for Secretary of State was 898,850, of which Carr, Republican, received 446,088; Maynard, Democrat, 427,491; Beecher, Greenback, 7,066; and Gates, Prohibition, 18,205; making Carr's plurality over Maynard, 18,597. For Comptroller, Davenport, Republican, received 429,878, and Chapin, Democrat, 445,974, giving the latter a plurality of 16,101. Maxwell, for Treasurer, had a plurality of 17,695; O'Brien, for Attorney-General, 18,766; and Sweet, for State Engineer and Surveyor, 18,871. To the Senate, 19 Republicans and 18 Democrats were elected, and to the Assembly, 72 Republicans and 56 Democrats. In the city of New York the vote for Secretary of State was—Carr, 68,267; Maynard, 92,050; for Comptroller, Davenport, 59,282; Chapin, 100,303. John Reilly, the Democratic candidate for Register, received 78,510 votes; Jacob Hess, Republican, 64,786; and James O'Brien, Independent, 18,797. All the Democratic candidates for judges were elected.

Of the seven Senators elected in the city, one was Republican, two Tammany Democrats, three Anti-Tammany Democrats, and one Union Democrat. Of the twenty-four Assemblymen, nine were Republicans, eight Tammany Democrats, and seven Anti-Tammany Democrats. Of the twenty-four members of the city Board of Aldermen, eight were chosen by the Republicans, eight by the Tammany organization, seven by the County Democracy, and one by an Independent Democratic association. Low was re-elected Mayor of Brooklyn by a vote of 49,934 to 48,091 for Hendrix, Democrat, and 349 for Leigh, Prohibitionist.

On the proposition to abolish contract labor from the prisons of the State, 677,779 votes were cast, of which 408,402 were in favor of the proposition and 269,377 against it. In the city of New York the vote stood 118,777 for the proposition to 14,801 against it. In the larger cities it was generally favored, and in the country districts opposed.

Finances.—The financial condition of the State is favorable and promising. During the fiscal year ending September 30th, \$635,200 of the canal debt was paid, leaving the aggregate indebtedness of the State \$8,478,854.87, against which stood a sinking fund of \$2,495,553.06. Hence the debt unprovided for was only \$5,978,301.81. With the exception of an unclaimed balance of \$3,000 of the old bounty debt, and \$122,694.87, the interest of which is devoted to the payment of annuities to Indians, this entire debt consists of "stock" issued for canal construction, bearing 6 per cent. interest, and redeemable in 1887, 1891, 1892, and 1893. The expenditures of the fiscal year, and the condition of the treasury on the first of October, are shown in the following table:

FUNDS.	Balance	Receipts for	Payments for
	in treasury, Oct. 1, 1888.	fiscal year ending Oct. 1, 1888.	fiscal year ending Oct. 1, 1888.
	Dollars.	Dollars.	Dollars.
General.....	1,052,286	6,695,939	6,615,519
Common-school.....	67,523	2,091,888	2,228,019
Free-school.....	179,405	3,063,726	2,007,712
Literature.....	8,295	77,128	62,491
United States deposits.....	89,082	1,287,801	1,266,758
College land-scrip.....	266,166	82,246	812,576
Elnira Female C. E.....	6,105	2,005	2,795
Military record.....	3,273	2,810	1,827
Canal.....	2,153,228	2,884,658	2,545,708
County-debt sinking.....	3,056
Totals.....	3,857,868	16,592,512	17,062,928

The total cash balance in the State treasury, Oct. 1, 1888, was \$2,387,254.44.

The assessed value of property in the State for the year was \$2,557,218,240 for real estate and \$315,039,085 for personal property, which shows an increase of \$124,556,861 in the former and a decrease of \$35,982,104 in the latter. The disparity of these figures for real and personal property, the actual values of which are approximately equal, reveals the inequality of assessment under the existing laws. The rate of taxation fixed by the last

Legislature was three and one-fourth mills on each dollar, which on this valuation would furnish a revenue of \$9,334,836.31 for the fiscal year 1883-'84, an amount considerably in excess of the requirements of the treasury from that source. The receipts of the year from the special tax on corporations was \$1,935,179.31, of which \$351,183.75 was for taxes due in 1880, which had been in litigation.

Canals.—The cost of maintenance and repairs of canals was \$240,585.54 from Oct. 1, 1882, to Feb. 1, 1883, and \$349,319.36 for the remainder of the fiscal year, under the administration of the new superintendent. The estimated expense of the canals for the fiscal year 1883-'84 is \$350,000 for repairs and maintenance, \$500,310 for interest on canal debt, and \$450,000 for the canal debt sinking fund, or \$1,600,310 in all, to be met by taxation. During the season of navigation, the first under the system of freedom from tolls, the total traffic on the canals was 5,775,651 tons, an increase of 324,350 tons over that of the previous year. The gain was only about six per cent., while there was a much larger increase in the traffic over the railroad lines which compete with the canals. The shipments of grain, however, from Buffalo by canal amounted to 43,350,916 bushels, against 29,430,688 bushels in 1882. State Engineer and Surveyor Seymour estimated the cost of putting the canals in thorough repair at \$3,502,443, and Comptroller Davenport recommended substantial improvements in these water-ways, including the deepening of the prism one foot.

Prisons.—The number of convicts in the three prisons of the State on the 30th of September was 2,828, distributed as follows: at Sing Sing, 1,462; at Auburn, 882; and at Clinton, 484. There has been a progressive decrease in the number since 1877, when it was 3,567. The earnings and expenditures of the prisons during the year were as follow:

AUBURN PRISON.	
Earnings.....	\$125,280 30
Expenditures.....	119,357 43
Surplus.....	\$5,922 88
SING SING.	
Earnings.....	\$237,288 48
Expenditures.....	188,219 78
Surplus.....	54,018 75
Total surplus.....	\$59,441 68
CLINTON.	
Earnings.....	\$44,542 80
Expenditures.....	94,578 20
Deficiency.....	50,835 40
Balance surplus.....	\$9,106 23

The first fiscal year during the whole of which the present system of administration under a State Superintendent was in operation was 1878. The cost of maintenance showed at once a very large decrease, being then \$429,599.76, against \$625,733.44 for the previous year, and much higher figures under the old

system. For 1883, it was reduced to \$397,955.35. The net deficiency from earnings in 1877 was \$317,411.06. The next year it was reduced to \$67,800.45; in 1881 it was converted to a small surplus; and in 1883 the surplus was \$9,106.23.

Of the results of the present system the superintendent claims: "The productive energy and capacity of the prisoners are constantly increasing. The physical and moral condition of the prisoners is steadily improving. The number of prisoners incarcerated in the State Prisons is gradually diminishing, although the population of the State is increasing. An enormous annual deficit on account of the maintenance of the State Prisons has been changed to a yearly surplus."

There were, on the first of December, more than 15,000 persons confined in the prisons, houses of refuge, penitentiaries, jails, and other penal establishments in the State.

Charitable Institutions.—The value of the property held by the various charitable institutions of the State, on the first day of October, was \$42,935,860.04, of which \$35,415,555.45 was in real estate, and \$7,519,804.59 in personal property. The receipts of all these institutions for the year ending Sept. 30, 1883, were:

State institutions.....	\$906,221 52
County and city institutions.....	2,363,720 42
Incorporated benevolent institutions.....	7,157,002 15
Total.....	\$10,429,944 09

Of this sum, \$719,753.98 was derived from the State, \$4,876,519.37 from cities and counties, and \$1,520,571.15 from legacies and donations. The expenditures during the year were:

By State institutions.....	\$1,485,942 63
By county and city institutions.....	2,363,720 42
By incorporated benevolent institutions.....	6,492,481 04
Total.....	\$10,391,894 08

The number of insane in the various institutions, on the 30th day of September, was 11,270, distributed as follows:

State Lunatic Asylum at Utica.....	600
Hudson River State Hospital.....	306
State Homoeopathic Asylum.....	260
Buffalo State Asylum.....	329
Willard Asylum (chronic insane).....	1,740
Binghamton Asylum (chronic insane).....	413
County poor-houses and asylums.....	1,807
City almshouses and asylums.....	5,010
In private asylums.....	498
Asylum for Insane Criminals.....	144
Asylum for Insane Inmigrants.....	109
Total.....	11,270

The number of State paupers under care on the first day of October, 1883, was 163. There were 1,426 committed during the year ending Sept. 30, 1883. There remained on the first day of October, 1883, under care, 189.

Public Education.—The following are the statistics relating to public schools for the year ending September 30th:

Total receipts, including balance on hand Oct. 1, 1883.....	\$13,306,065 14
Total expenditures.....	11,358,504 09
Amount paid for teachers' wages.....	8,265,452 88
Amount paid for school-houses, repairs, furniture, etc.....	1,925,671 27

Estimated value of school-houses and sites..	\$81,011,211 00
Number of teachers employed during legal term of school.....	21,123
Number of teachers employed during any portion of the year.....	31,570
Number of children attending public schools.....	1,041,039
Number attending normal schools.....	6,270
Number of volumes in school-district libraries.....	701,675
Number of persons in the State between the ages of five and twenty-one.....	1,631,500

There has been a steady decrease in the number of books in school-district libraries. In 1880 the number reported was 1,286,536; in 1881, 707,155; in 1882, 705,812, and now 701,675. There are twenty-four literary and thirteen medical colleges connected with the University of the State. Of these, two were chartered during the year — Canisius College, of Buffalo, and Niagara University, at Suspension Bridge. There are under the visitation of the Regents of the University 277 academies and academeal departments of union schools, comprising about 36,000 pupils and 1,400 teachers. The instruction of common-school teachers was carried on in 95 academeal institutions, in which 1,611 teachers were trained.

Banks, Insurance, Railroads.—Eight new banks of discount were organized, under State laws, during the year, and one failed, leaving the total number eighty-four, the condition of which, on October 1, was reported as follows:

		Increase during the year.
Resources.....	\$160,716,998	\$88,152,988
Capital.....	21,761,700	2,956,000
Surplus and profits.....	11,148,418	1,488,716
Due depositors.....	118,974,968	81,868,938
Other liabilities.....	18,898,813	1,344,284

Of the increase in capital, \$1,300,000 was the result of the conversion of banks from the national to the State system. On the first day of July 127 savings-banks reported to the Superintendent of the Banking Department. During the year one new savings institution was organized, and one closed after paying its liabilities in full. The condition of these savings-banks on the day named was as follows:

		Increase during the year.
Resources.....	\$483,662,008 15	\$28,583,425 49
Due depositors.....	420,881,007 88	20,087,168 96
Surplus on market value.....	62,114,698 47	2,957,654 24
Other liabilities.....	716,807 80	498,602 30
Number of depositors.....	1,119,512	52,994

The reports made July 1st by the sixteen loan, mortgage, guarantee, and indemnity companies doing business in this State exhibit the following condition:

		Increase in number.
Resources.....	\$160,187,764 04	\$20,379,220 90
Capital paid in.....	18,687,000 88	957,500 00
Surplus and profits.....	12,244,412 42	2,390,085 64
Due depositors.....	125,288,170 17	20,394,935 01
Other liabilities.....	9,229,350 92	*8,207,180 45

* Decrease.

Sixteen institutions for the safe-keeping and guaranteeing of personal property, with a capital aggregating \$2,886,900, were under the supervision of the Banking Department on the first day of October.

On the first day of July there were doing business in the State 147 joint-stock fire-insurance companies, with total assets of \$169,963,-924.56, including a net surplus of \$51,978,-273.83; fifteen marine-insurance companies, with total assets of \$23,253,860.86, including a net surplus of \$4,440,141.59; twenty-nine life-insurance companies, with total assets of \$449,-602,347.17, including surplus as regards policy-holders of \$76,751,890.78; and seven casualty insurance companies, with total assets of \$8,-617,413.41, and a net surplus of \$1,831,088.81. There were 131 co-operative insurance associations doing business in the State, Jan. 1, 1883. Of these 119 were New York State companies, and 12 were organized in other States; the number of certificates in force issued by these associations was 448,296. The amount of securities on deposit with the Insurance Department July 1st, for the protection of policy-holders insured by the various insurance companies transacting business in this State, was in the aggregate \$18,488,847.68, as follows:

New York State life-insurance companies.....	\$2,662,508 73
New York casualty-insurance companies.....	301,567 73
New York fire-insurance companies.....	1,693,000 00
Fire-insurance companies of other States.....	100 00
Foreign insurance companies.....	8,831,171 29

Under the new law regulating the formation and conduct of co-operative insurance associations and placing them under the supervision of the Insurance Department, thirteen such associations were incorporated in the State, and five organized in other States were admitted to transact business in the State. A number of old ones went out of existence. The administration of the Insurance Department was rendered more efficient and economical during the year, the number of clerks being reduced from thirty to seventeen, the services of an attorney being dispensed with, and the annual expense being reduced from \$48,650 to \$28,150.

During the eight months ending September 30th the new Railroad Commission caused the greater part of the 6,500 miles of railroad in the State to be inspected, investigated seventy-five complaints, and made a number of special inquiries and examinations, the results of which were embodied in a voluminous report to the Legislature of 1884. Much attention was given to the subject of accidents, their causes, and the means of prevention.

The following is the record of those killed or injured in the operation of the railroads in this State for the eight months ending Sept. 30th:

	Killed.	Injured.
Passengers.....	84	115
Employés.....	110	390
Other persons.....	178	146
Totals.....	372	650

Immigration.—The number of immigrants landed at Castle Garden for the eleven months ending with December 1st was 872,188, or 63,464 less than for the same months in 1882. The estimated number for the year was 890,000, against 455,450 during the previous year. During eleven months 4,818 immigrants were admitted to the hospital and refuge on Ward's island, of which 575 remained there on the 10th of December, 116 of them being insane. During the same period employment was found for 27,480, and 1,273 were returned to the countries they left as incapable of supporting themselves. The expenses of the Board of Immigration were met by \$168,054.04, collected by the United States Treasury Department from the vessels landing immigrants, and \$88,202.51 appropriated by the State. There was also \$31,049.29 expended for repairs of State property on Ward's island, which was drawn from the State treasury.

National Guard.—The militia of the State, known as the National Guard, consisted on the

Over 3,500 men were in camp there from June 16th to July 28th.

The New Capitol.—Work on the new Capitol at Albany progressed favorably during the year. The rooms designed for the Court of Appeals in the east end of the building were finished. A contract was made on the 19th of June for the construction of the southeastern staircase, at a cost of \$239,345.80, and it is expected to be completed by Sept. 15, 1884. The old Capitol and the State Library building were removed in preparing for the construction of the eastern approach to the new edifice. The State Library and Law Library were temporarily provided for in the new building, in which permanent rooms for them are to be ultimately furnished. When the new commissioner took charge of the Capitol, the granite and brick walls of the west end were unfinished. This wing extends 291 feet from north to south, and 62 feet from east to west, not including the space designed for the great staircase, 72 by 52 feet—all comprising about one fourth of

STATE CAPITOL, ALBANY.

30th of September of 11,568 officers and enlisted men. A camp of instruction is held at Peekskill in the summer, on a ground containing one hundred acres, and leased by the State at an annual rental of \$1,000. The lease expires May 1, 1885, and the State has the privilege then of purchasing the ground for \$13,000.

the floor-space of the building. Before the close of the year the walls were completed and roofed over. The total amount expended upon the building to December 15th was \$15,818,680.67. The amount expended from April 9th to December 15th was \$900,481.23, leaving a balance on hand at the latter date of \$99,518.-

77. The men employed during the greater part of the year numbered 1,800 to 1,400.

Adirondack Forests.—A special committee of the Senate was appointed, under a resolution adopted May 2d, to ascertain what lands could be bought, and at what prices, adjacent to the forest-lands already owned by the State in the Adirondack wilderness, with a view to preserving such forests as were necessary to protect the sources of water-supply in that region. The subject was one on which there was considerable discussion during the year. It was said that much injury had already been done by the reckless destruction of forests by lumbermen and charcoal-burners, and by fires carelessly kindled by hunting and camping parties. There was a demand that the State acquire control over such lands as it was desirable to maintain in a wild condition, and prevent the further destruction of the forests within the area which fed the important streams of the State. The acquisition of lands by purchase, and the appointment of a commission to have charge of them, were urged. The Senate committee reported in January, 1884, in favor of preserving the lands already owned by the State, and establishing a public park, within which should be inclosed all that it was desirable to protect. It did not, however, recommend a direct purchase of land from private owners, as it was likely to fall into the hands of the State from non-payment of taxes, as much had already done. The subject is one on which the Legislature of 1884 is likely to act.

Telegraph Suits.—In a suit brought by the State against the Western Union Telegraph Company for taxes claimed to be due for the year 1881, under the act taxing corporations on their franchises and capital stock, a decision was rendered by the referee, Judge Samuel Hand, on the 28th of September, and judgment was entered in favor of the State for \$178,397.26. The referee held that—

Under the new tax laws the company must pay a tax upon its franchise of a quarter-mill for each one per cent. of dividends declared during the year, computed upon its whole capital stock, and not merely upon that portion of such capital invested within the State, as claimed by the defendant. He followed the decision of the Court of Appeals in the case of the people against the Albany Insurance Company. The judgment was only for taxes due in 1881, and included \$12,000 penalty for non-payment of the tax on the demand of the Comptroller. Other taxes due the State from the Western Union Company, in accordance with this decision, make the total amount recoverable from the corporation about \$626,000. The law findings were:

1. That the said acts of 1880 and 1881 imposed a new and different system of taxation upon the defendant, as to taxes for State purposes, from any heretofore existing as to telegraph companies under chapter 471 of the laws of 1863, or any other statute; that by said acts the said defendant was subjected to a tax upon its franchise for State purposes of one quarter of a mill upon the whole capital stock for every one per centum of dividend declared during the year whenever these dividends reached six per centum, and not merely upon that portion of such capital invested within this State.

2. That the defendant has become liable to pay ten per centum of said tax imposed by the said acts in

case of neglect or refusal to pay such tax within fifteen days after the 1st day of January, 1882.

3. That, in accordance with the decision of the Court of Appeals in the case of the people against the Albany Insurance Company, the only part of the dividend of \$15,526,500 in stock declared March 26, 1881, to be estimated as the basis for the franchise tax imposed by the said statutes of 1880 and 1881, is the sum of \$1,135,102.62 declared from the earnings and profits made by the company since the law took effect, June 1, 1880.

4. Although this last part of the dividend does not amount to six per centum upon the then capital stock, yet I conclude the tax is to be at the rate of one quarter of a mill for each one per centum of such dividend, because the entire dividends declared during the year, including the cash dividend, make together more than six per centum either upon the original capital, \$41,000,000, or the subsequent capital, \$80,000,000.

5. No part of the dividend in stock exchanged for the Atlantic and Pacific Telegraph Company's stock, under the principle of the Court of Appeals decision in the people against the Albany Insurance Company, can be taken as any basis for taxation of the franchise under the acts of 1880 and 1881, as that stock was purchased with earnings made before the date of these acts, and does not seem to have permanently increased in value since 1879, but has been exchanged on about the basis of value existing in November, 1879. I hold that the temporary fluctuations in value during the year of property previously wholly purchased from previous earnings of the company are not a basis for the imposition of this franchise-tax.

6. I hold that no part of the dividend of \$68,858.50 in the stock of the company was from earnings or profits made during the year, or afforded any basis for an additional franchise-tax.

7. I find the plaintiff is entitled to recover from the defendant the said sum of \$118,718.66, with interest thereon from the 15th day of January, 1882; also, the sum of \$12,000; also, the sum of \$28,377.58, with interest thereon from the said 15th day of January, 1882, and the sum of \$2,837.76; and I direct judgment in favor of the plaintiff against the defendant for the aggregate sum of \$141,938.98, principal, and \$16,468.28, interest—making a total of \$178,397.26, with costs of the action.

The question of the validity of the issue of stock by the Western Union Telegraph Company, to be distributed as stock dividends, which was made in 1881, was decided in favor of the company by the Court of Appeals on the 2d of October.

In a suit brought against the Western Union Company to restrain the issue of stock, the special term of the Superior Court of New York city had held that the consolidation with the other companies was lawful, and the issue of stock to pay for their franchises and property was valid. It was also found that there was no conspiracy in the case, and that the stock distributed as a dividend "was not a division, withdrawal, or payment to its stockholders" of the capital stock, and its issue was a proper and lawful exercise of corporate power under the circumstances. This decision was reversed at the General Term of the court, and the case was before the Court of Appeals on an appeal by the company from the judgment of reversal. Judge Earle, in rendering the decision, said: "There are no laws in this State prohibiting the making of a stock dividend, and there is no public policy which, in all cases, condemns such dividends. No harm is done,

provided the dividend is not a mere inflation."

Miscellaneous Incidents.—On the 18th of October the one-hundredth anniversary of the disbanding of the American army of the Revolution was celebrated at Newburg. There was a military parade in the streets of the town, and a naval display on the Hudson river, a general decoration during the day and illumination in the evening, and appropriate literary and festive ceremonies.

On the 20th of December a new railroad-bridge across the Niagara river, constructed on the cantilever principle, was opened. (See **ENGINEERING.**)

Loren B. Sessions, who had long been under indictment for alleged bribery or attempt to bribe a member of the Assembly during the senatorial contest of 1881, when he was a member of the State Senate, was acquitted at Albany on the 18th of October. (See "Annual Cyclopædia," 1881, **NEW YORK.** For further details of affairs of New York city, see that title in this volume.)

NEW YORK CITY. The financial condition of the city of New York has somewhat improved in recent years, though the expense of carrying on the municipal government has steadily increased. The total amount of the funded debt at the close of the year was \$180,680,570.84; but against this was a sinking fund of \$38,134,544.96, leaving the net indebtedness at \$92,546,025.88—a decrease of \$3,595,922.70 for the year. There were outstanding \$2,953,600 of the revenue bonds of the year, which are issued in anticipation of receipts from taxes. The total amount of these bonds issued during the year was \$16,324,800, against \$19,247,800 in 1882; and the redemptions amounted to \$18,371,200 for the issues of the year, and \$4,962,600 for those of previous years which were all taken up. Stocks and bonds falling due in 1884 amount to \$10,469,631.37. The credit of the city is shown by the fact that the first installment of "additional water stock" to the amount of \$50,000, issued on account of the new aqueduct, redeemable in thirty and payable in fifty years, with 3 per cent. interest, was promptly taken at a premium of 1½ per cent.; loans on revenue bonds have been effected at 2½ per cent. Receipts for the sinking fund for the redemption of bonds amounted to \$9,061,252.56 for the year, and payments from it to \$7,891,061.89, leaving a balance of \$1,170,190.67. Receipts of the sinking fund for the payment of interest were \$2,768,199.37; payments, \$2,679,528.20; balance, \$83,671.17. The receipts of the city treasury for the year, including a balance of \$3,390,884.55 from the previous year, and \$20,998,866.70 from the issue of bonds, were \$56,908,291.78; the payments were \$54,262,086.89, including \$18,364,784.40 for bonds redeemed, leaving a balance of \$2,646,104.89. The total cash in the treasury from all balances at the end of the year was \$3,899,966.78. The tax-levy of the year

was \$29,167,029.81, and the general tax-rate was 2.29 per cent. on \$1,249,524,258 assessed value of real and personal property, and 2.0824 per cent. on \$27,152,906 valuation of personal property of corporations doing business in the city, which are exempt from taxation for State purposes, except on real estate. The amount of taxes collected up to December 31st was \$24,338,510.97, on which a rebate of \$148,257.72 was allowed for payment before November 1st. The total assessed value of property for the year was \$1,276,677,164, an increase of \$48,200,765.67 over the previous year. The total appropriations for the year 1884, as allowed by the Board of Estimate and Apportionment, on estimates from the different departments, amount to \$34,046,165.60, being an increase of \$3,869,380 over those of the previous year. Of the full amount, \$21,208,885.39 is apportioned by specific provisions of law, and is beyond the control of the Board of Estimate and Apportionment. The full city budget for 1884, compared with that of 1883 and with the estimates, is as follows:

General Statistics.—The estimated cost of new buildings, for which plans were filed in the Building Bureau, for the year, was \$48,214,846, the number of buildings being 2,748. This was an increase of 141 in the number of buildings, and a decrease of \$1,578,840 in the aggregate cost as compared with the previous year. The cost of alterations in old structures for which plans were filed was \$4,540,835, against \$4,267,181 for the previous year. The growth in building operations for ten years is shown in the following:

Year.	Estimated cost.	Year.	Estimated cost.
1874.....	\$16,667,414	1879.....	\$32,507,323
1875.....	18,226,870	1880.....	29,115,385
1876.....	15,908,880	1881.....	43,591,300
1877.....	13,865,114	1882.....	44,798,186
1878.....	15,219,060	1883.....	43,214,346

Total ten years.....\$262,404,450

The number of fires occurring during the year was 2,168, against 2,001 in 1882; the losses by fire amounted to \$3,517,826, a decrease of \$678,640 from the previous year. The average loss for each fire was less than for seventeen years preceding. A school of instruction has been established in the Fire Department. One new company was organized to man a floating engine, the most powerful fire-boat in existence, 125 feet long and 25 feet beam. Five engine and two hook-and-ladder companies were equipped with a second set of apparatus. The police force of the city numbered 2,783 men on the 31st of December.

The average number of persons under the charge of the Department of Charities and Correction during the year was 11,834. The health statistics of the city were unusually favorable. The number of deaths was 38,958, a decrease of 3,966 from the previous year. The deaths in tenement-houses were 18,041; 502 persons died in the rivers and streets. There were three judicial hangings. Violence caused 1,325 deaths; small-pox, 12; measles, 716; diphtheria, 709; typhus fever, 15; typhoid fever, 470; cerebro-spinal meningitis, 227; diarrhoea (among children under five years old), 2,867; diarrhoea (all ages), 3,393; alcoholism, 218; phthisis, 5,260; heart-disease, 1,690; pneumonia, 3,158; solar heat, 83; apoplexy, 524; Bright's disease, 1,845. Of children under 1 year, 8,724 died; under 2 years, 10,246; under 3 years, 13,720. One hundred and twelve persons more than 90 years old died, among them 8 men and 17 women who were more than 100 years old. There were 61 homicides. One hundred and sixty-one persons—134 men and 27 women—committed suicide. Thirty-four persons were accidentally poisoned. Forty-three persons were accidentally suffocated. The following is the record of contagious diseases:

	1882.	1883.
Scarlet fever.....	6,812	3,320
Diphtheria.....	3,507	2,090
Typhoid fever.....	636	1,373
Typhus fever.....	207	71
Cerebro-spinal meningitis.....	236	239
Measles.....	4,637	3,333
Small-pox.....	708	26

The number of births recorded was 28,972; marriages, 11,556; against 27,321 of the former, and 11,085 of the latter, in 1882.

Defalcations in Public Offices.—In the early part of April it was discovered that a defalcation had occurred in the Finance Department of the city. Evidence was found among the papers of a deceased coupon-clerk, William B. Carroll, that there had been a practice going on for some time of leaving paid coupons un-

canceled, and then selling them to brokers to be again presented for payment. On the 14th of May the comptroller, Allan Campbell, made a report to the mayor on the subject, in which, as the result of an investigation by the chief book-keeper of the department, he placed the loss at \$148,630. It was his conclusion that the frauds began in July, 1879, and were carried on by Carroll alone until his death in September, 1882.

A report made to the mayor on May 19th by the Commissioners of Accounts, after a brief investigation, put the total loss at \$169,460, of which \$10,930 was credited to the year 1879, \$17,257.50 to 1880, \$66,732.50 to 1881, and \$74,540 to 1882. The commissioners criticised the methods of the comptroller's office, and intimated that their investigation had been obstructed rather than assisted by the officials of the Finance Department. On the 4th of June Comptroller Campbell addressed a note to the foreman of the grand jury, requesting that a thorough investigation of the matter be made. In the mean time the Board of Aldermen had taken the matter up, and directed an examination to be made by a special committee. This occupied several weeks, and a report was made in which the lax methods of the office were criticised, and the theory was announced that the frauds had been conducted by Carroll alone by means of counterfeit coupons. Attached to the report were the following resolutions, which were adopted:

Resolved, That the Comptroller of the City and County of New York be and is hereby required to give a bond for the faithful discharge of the duties of his office in the sum of \$200,000, with two or more sufficient sureties to justify in double the amount, under oath, before a judge of the Supreme Court, on due notice to the corporation counsel.

Resolved, That the system of accounting pursued in the Finance Department is inefficient, insufficient, and in violation of the charter.

Resolved, That the directions of the charter that regulate the receipts and disbursements of the city funds form a safe system of finance; that through their violation has the city suffered by official defalcations, and that their strict observance, in the opinion of the Common Council, will be ample guarantee against any loss in the future.

Resolved, That, entertaining no question of the legal liability of one or more of the municipal magistrates during any period of the three years' process of William B. Carroll's defalcations, for the whole or part thereof, it is hereby referred to the corporation counsel, under the evidence, to institute such action and take such legal proceedings against any one or more such magistrates as he shall be advised can be sustained at law.

The grand jury, having failed in an effort to secure the aid of expert accountants from certain banks of the city, accomplished little in the way of an investigation. It made a presentment, however, with these suggestions:

1. That if the payments of the city coupons had been made by a responsible bank or trust company, as was formerly the practice, no loss could have accrued to the city.

2. That if the payments for coupons had been made by the City Chamberlain as formerly, the city would have been protected from loss by the large bond of

the chamberlain, which the jury believe would apply to cases like the Carroll frauds.

3. This grand jury is of the opinion that a law should be passed prohibiting any issue of the city's indebtedness other than in registered form, and they recommend the conversion of all outstanding coupon bonds into registered stock.

4. From the testimony before the grand jury they believe that the system and methods of book-keeping in the comptroller's office can and should be so changed and improved as to make a repetition of the late coupon frauds an impossibility.

On the 26th of July Comptroller Campbell resigned his office on account of broken health. The resignation was accepted and took effect August 1st. On the 3d of the same month the mayor appointed his private secretary, Seth H. Grant, to the vacant office. The Commissioners of Accounts made a second and more extended investigation of the coupon frauds, submitting a report on the 8th of October. Their examination covered the period from 1872 to 1882 inclusive, and the fraudulent overpayment of coupons, beginning in 1874, was found to amount to \$164,699.

In the month of September other irregularities were discovered in the Water Register's Bureau of the Department of Public Works, and in the Bureau of Arrears in the Finance Department. Two arrests were made in these cases, and indictments were found but not tried during the year. Two clerks and the auditor in the comptroller's office had been dismissed for negligence in connection with the coupon frauds, but the entire result of the manifold efforts at investigation was unsatisfactory. Finally, in November, a special grand jury was called for the Court of Oyer and Terminer, and was charged by Chief-Justice of the Supreme Court Noah Davis to make inquiry into all allegations of fraud and dereliction in the city departments, and of malfeasance in office under the city government. At the special request of the grand jury and the district attorney, \$20,000 was included in the city appropriations for 1884 to cover the expense of expert assistance in this inquiry, which was going on at the close of the year. Two changes had occurred in the office of district attorney since the question of this inquiry came up. The Hon. John McKeon, the incumbent of the office, died, and Wheeler H. Peckham was appointed by the Governor to succeed him on the 30th of November. After holding the office little more than a week, Mr. Peckham concluded that the state of his health would not permit him to carry on its arduous duties at such a time, and he resigned on the 9th of December. On the following day Peter B. Olney was appointed to the place.

New Aqueduct.—The subject of an increased water-supply for the city occupied much attention during the year. The matter had been several times urged by the Commissioner of Public Works, and in 1882 he had submitted to the mayor a plan for a new aqueduct, prepared by the Chief Engineer of the Croton Aqueduct. The State Senate early in January

adopted a resolution requesting the mayor to appoint a committee of citizens to act with himself in examining this plan, and to report upon its feasibility, the probable cost of the aqueduct, and the time necessary to carry the plan into execution. The mayor appointed as such committee the Hon. O. B. Potter, John T. Agnew, William Dowd, Amos F. Eno, and Hugh N. Camp. Public hearings were given, and the subject of the necessity of increasing the water-supply, the sufficiency of the Croton valley sources, and the merits of the new aqueduct scheme was fully investigated. A report was submitted to the Senate on the 7th of March, the conclusions of which were:

1. That the Croton water-shed is the amplest and most available source of supply for the city's wants.
2. That a new aqueduct capable of conveying 150,000,000 gallons of water daily should be built immediately.
3. That a storage reservoir or reservoirs should be constructed of suitable capacity to provide against all emergencies, and to provide a supply of water for the next twenty-five years.
4. That the work of constructing this aqueduct and storage reservoir or reservoirs should be surrounded with such safeguards as would insure immediate construction, and at reasonable cost to the city.

A carefully prepared bill was also submitted, which, with some modifications, was that passed by the Legislature. (See *NEW YORK STATE, Legislative Action.*) Strong efforts were made to prevent the change in the bill which took from the mayor the appointment of Aqueduct Commissioners, but without avail. The commission, provided for in the act of the Legislature, was organized in August, and began the consideration of the problem of a new aqueduct and an enlarged storage reservoir in the Croton valley. At the first regular meeting the Commissioner of Public Works submitted plans for the construction of a dam at Quaker Bridge, and for an aqueduct from the site of the dam to the Harlem river, near High Bridge, upon the line known as the "Hudson river route." That route met with serious opposition from property-owners throughout almost its entire length, and the commissioners finally came to a unanimous decision upon a modification of the "Hudson river route." The commissioners likewise unanimously determined to build the aqueduct of a size equal to a fourteen-foot cylinder.

The estimate of the Commissioner of Public Works of the cost of the project, on the plan submitted by him, was as follows:

Dam and reservoirs	\$4,000,000
140,811 feet of aqueduct from dam to Harlem river, at an average of \$60 per foot	8,418,660
2,320 feet tunnel across Harlem river, at \$100 per foot	232,000
11,936 feet of aqueduct from Harlem river to Manhattan valley, at \$50	599,800
4,000 feet of iron siphons across Manhattan valley, at \$28.50	874,000
Gate-houses connected with siphons	100,000
9,788 feet of aqueduct from Manhattan valley to Central Park, at \$60	586,980
Gate-house and connections to Central Park reservoir	100,000
Four waste-gates between dam and Harlem river	50,000
Total	\$14,460,940

The modification of the route by the commissioners, and the increase of rock-tunneling, would somewhat enhance the cost of excavation, but would reduce that of land-damage. Expert opinions as to the cost of the proposed Quaker Bridge dam, and the time necessary for its construction, varied widely.

Opening of the East River Bridge.—On the 24th of May the great suspension-bridge connecting the cities of New York and Brooklyn, across the East river, was formally opened, with appropriate ceremonies, and was delivered into the charge of the two cities by the Board of Trustees, who had had the supervision of its construction. By the subsequent action of the authorities it was continued under the control of the same board. At first only the drives and footway were opened to passengers, and, the legal counsel of the Board of Trustees being of the opinion that they had no authority to make any part of it free, tolls were charged; the rate for foot-passengers being one cent, and for teams from five to twenty cents, according to size. Later in the year the railroad was opened, trains of two cars each being run by the cable system of traction, and a fare of five cents for each passenger being charged. At first the footway was used by great numbers of people, and on the 30th of May a panic was caused by the fall of a woman at the stairway leading from the New York approach to the central span, during which twelve persons were crushed to death, and thirty-five others were injured. After the novelty wore away, no trouble was occasioned by crowds.

(For an account of this undertaking, see **ENGINEERING**, in the present volume.)

Evacuation-Day.—The one-hundredth anniversary of the final evacuation of the city by the British troops, which occurred on Sunday, the 25th of November, was celebrated on the following day. There was a military and civic parade, in which the President of the United States and other prominent Federal officers, the Governor of the State and his staff, the Governors of several other of the original thirteen States, and the mayor and other officers of the city participated. There was also a parade of steamers and tug-boats in the harbor. A bronze statue of Washington was unveiled on the steps of the sub-Treasury building, where an address was delivered by George William Curtis, and the celebration closed with banquets and illuminations in the evening.

Rapid Transit.—Near the end of the year a new Commission was appointed by the mayor under the rapid transit act of 1875, to consider plans for additional lines of railroad in the city. The cable system of propulsion and the use of improved motors were prominent subjects of consideration, as well as new routes proposed for surface and elevated roads.

The affairs of the existing elevated roads were subject to considerable litigation. The taxes assessed by the city for five years successively, amounting to \$2,286,836.82, remained

unpaid, and the questions involved were still in court. The agreement made in November, 1881, by the directors of the three companies, whereby they were to be merged into one, the stock of the New York Elevated Railroad to be replaced by first-preferred stock of the Manhattan Company and that of the Metropolitan by second-preferred stock of the same corporation, was still in litigation, certain stockholders of the Metropolitan Company having brought suit to have it set aside, and obtained an injunction pending the trial of the action. In a suit against the Manhattan and New York companies for damage to private property in front of which the structure of the latter line was set up, it was decided that the plaintiff could recover. A scheme for an underground railroad beneath Broadway to Union Square, and thence northward by two lines, to be known as the Arcade Railway, has been formed and urgently advocated.

New Parks.—In accordance with an act of the Legislature of this year, a commission was appointed by the mayor to select and locate lands for public parks in the twenty-third and twenty-fourth wards of the city, north of the Harlem river. The commission made a report to the Legislature of 1884, accompanied by a bill providing for the acquisition of the necessary territory by the city. The tracts selected were an area of 1,070 acres bordering on the line of Yonkers, to be known as Van Cortlandt Park; an area of 653 acres on the Bronx river, to be called Bronx Park; and 1,700 acres at Pelham Bay, on Long Island Sound, some distance beyond the present limits of the city. These were to be connected by broad parkways, that from Van Cortlandt to Bronx Park being 600 feet wide and one mile in length, and that from Bronx to Pelham Bay Park 400 feet wide and $2\frac{1}{2}$ miles long. A smaller space of 135 acres, to be known as Crotona Park, was selected below this series, to be connected with Bronx Park by a parkway. Two smaller spaces, of 38 and 25 acres respectively, and to be known as Claremont and St. Mary's Parks, were located still nearer the Harlem river. It was estimated that the entire area selected, 3,800 acres, could be acquired at an average cost of \$2,000 per acre, and it was said that their natural attractions were such that there would be little occasion for immediate embellishment. The park on Pelham Bay, with its islands, coast indentations, and picturesque views, it was claimed, would excel any pleasure-ground in the world for beauty and healthfulness. Regard was had in the selection for the purposes of public reservoirs, parade-grounds, botanical and zoological gardens, and a site for great fairs or exhibitions. The bill submitted to the Legislature authorizes the Mayor, Aldermen, and Commonalty of New York to take possession of the pieces of land located for parks, and to make application for the appointment of commissioners of estimate. On the confirmation of the report

of the commissioners, the mayor, etc., are authorized to take possession of the property, and keep the same open as public parks. The mayor, etc., within four months after the confirmation of the report of the commissioners, are required to pay for the property taken for the parks, and to issue city four per cent. bonds to produce the money required.

City Politics.—Franklin Edson was elected Mayor of New York in 1882 through a union of the three Democratic factions known as Tammany, Irving Hall, and the County Democracy, against a citizens' movement whose candidate was William Dowd. The mayor's appointments, at the beginning of his term, were avowedly determined by the necessity of securing for them the approval of the Board of Aldermen, whose members were in a peculiar sense the representatives of the various local political factions. He made an effort to secure action from the Legislature which would give the mayor the power of appointment and removal of heads of departments untrammelled, but, not succeeding in this, he professed to act on the principle of making the best of the existing situation, and avoiding contentions with the aldermen. His appointments throughout the year provoked criticism, on the ground that they aimed at satisfying the demands of all factions, so far as they could be reconciled, rather than promoting the highest efficiency of the public service.

During the political canvass of the autumn an effort to unite the Democratic factions failed, so far as delegates to the State Convention were concerned, but they all supported the general ticket. The city and county nominations they divided so as to agree on a common ticket, but in regard to legislative and aldermanic nominations they were divided. (See *NEW YORK STATE, Political Canvass.*) A plan for reorganizing the Republicans of the city was formed and carried out during the year. It was devised by a Committee of Eighteen, formed partly from the existing City Central Committee and partly of persons outside the old organization. The plan included a full enrollment of the Republican voters of the city in the several Assembly districts and the choice of delegates to a County Committee, members of district committees, enrolling officers and inspectors for the next year, and delegates to all conventions by the persons thus enrolled. Under the old organization, in order to vote at primary meetings, the voter was obliged to join an association, sign its constitution, and pledge himself to support all candidates of the party regularly nominated. Under the new plan it was only necessary to be enrolled under a declaration of intention to act with the Republican party. The enrollment took place after the election in November, and resulted in placing 23,454 names on the rolls, something more than twice the membership of the old associations, but much less than half the ordinary Republican vote of the city.

Much dissatisfaction with the municipal administration was developed during the year in consequence of the frauds that were exposed in some of the departments, and charges of corruption and extravagance. On the meeting of the Legislature of 1884, the question of charter reform was again agitated, and two committees, one of the Senate and one of the Assembly, set about investigating the condition of the city government.

NEW ZEALAND. See AUSTRALIA and POLYNESIA, p. 87.

NICARAGUA, a republic of Central America. The President is Dr. Adan Cárdenas. His Cabinet, in 1883, was composed of the following ministers: Finance, War, and Navy, Col. J. Elizondo; Justice and Public Worship, Dr. F. Delgadillo; Foreign Affairs, Señor F. Castillon; Interior, Señor J. Chamorro.

Finance.—The income in 1882 was \$1,639,000, while the outlay was \$1,510,000. The national indebtedness is altogether internal, and does not exceed \$700,000, in the shape of fundable bonds, for which the import duties are mortgaged, while \$222,000 are payable in cash. In 1883 the debt amounted to \$920,258. The amount of duties collected by the custom-house in the fiscal year 1881-'82 was \$1,275,507, against \$906,156 in 1880-'81.

Railroads.—There were in operation in 1882 about 55 kilometres of railroad, and 18 were then being built.

Telegraphs.—The number of offices in 1882 was 26; the length of lines, 777 miles, with 800 miles of wire. There were dispatched that year 64,544 private telegrams, and 16,601 were sent by the Government. There was collected the sum of \$18,733; and spent, \$20,789.

Postal Service.—The number of post-offices in 1882 was 18; expresses, 79; and postal agencies, 8. There passed through the post-office 177,109 private letters, 37,273 Government dispatches, 21,666 postal-cards, 39,001 registered letters, 424,955 newspapers, and 515 sample packages; together, 645,919 items of mail matter, producing an income of \$9,232, and involving an outlay of \$15,344.

Commerce.—There entered Nicaraguan ports in 1882 altogether 213 vessels, measuring 256,000 tons, and comprising 156 steamers, 8 of which navigated under the German flag, 2 being men-of-war, and 57 sailing-vessels, of which 11 were German.

	Import.	Export.
1875-'76	\$1,983,000	\$3,239,000
1877-'78	2,181,000	2,595,000
1879-'80	2,986,000	3,703,000
1881-'82	3,362,000	4,082,000

The products chiefly exported were: India-rubber, 14,000 quintals of 101½ pounds American, worth \$800,000; 7,300,000 pounds of coffee, worth \$530,000; gold and silver bullion, fustic, indigo, skins, hides, and cedar-wood.

Interoceanic Canal.—The following is a translation of the law adopted in October, 1883, by

the Nicaraguan Congress, for the purpose of obtaining a joint guarantee from the Central American states which may assist in promoting the construction of the Nicaraguan Canal:

ARTICLE I. The Government is authorized to unite with the other republics of Central America in guaranteeing that the net profits of the Nicaraguan Canal shall never amount to less than 8 per cent. on the capital employed in its construction, which shall not exceed \$75,000,000. This guarantee shall last twenty years from the date on which the canal shall be completed and opened to traffic.

ART. II. The Government is consequently authorized to guarantee a profit of 8 per cent. net upon \$20,000,000 of the capital fixed by the previous article, either in association with other governments, in the event of their guaranteeing the same rate of interest on the remainder of the capital, or singly, should the others not agree to act; but it must be stipulated that the expenses of construction and maintenance shall not exceed \$1,000,000 annually, and that any deficit in the amount of profits which shall have been recognized and paid by Nicaragua will be returned by the company from any excess of profits which may be subsequently obtained over and above the 8 per cent. which is guaranteed.

ART. III. The Government will subject this concession of its guarantee to the conditions it may consider necessary to establish in favor of the republic, and in order to determine the actual cost of the canal and the amount of profits.

ART. IV. The Government is also authorized to make treaties with the other Central American republics, establishing the aforesaid guarantee, and granting to their citizens the same privileges which are reserved to Nicaraguans by the concession of April 24, 1880; and to arrange with the company holding the concession, an additional contract stipulating the conditions containing the collective guarantee of the Central American states, or that of Nicaragua alone, as the case may be.

On December 20th Secretary Frelinghuysen made public a letter sent by him to Minister Lowell, concluding the discussion with the Government of Great Britain of the Clayton-Bulwer Treaty. The letter is dated Nov. 22, 1883. On the question of the failure of the plan for an interoceanic canal, on which the treaty was based, Mr. Frelinghuysen says:

Lord Granville raises the point that no time was fixed by the convention within which such interoceanic communications were to be made. While this statement is correct, it is also true that it was contemplated that the canal was about to be constructed at the time the treaty was negotiated, and that the survey therefor was then made, and that thirty-three years have elapsed without Great Britain rendering the consideration on which the treaty was based, and this failure, we think, affects the treaty in the same manner that a failure by Great Britain to give the consideration within a definite time, had one been fixed by the convention, would have affected it.

In regard to the provision that neither the United States nor Great Britain shall colonize or exercise any dominion over any part of Central America, Mr. Frelinghuysen says:

This is a most important provision. It is one of a cluster restraining one nation from having any advantage over the other in regard to the police of the canal, such as the provision against alliance, against occupation and fortification, and against taking advantage of any intimacy or influence; and yet it is claimed that the treaty does not prohibit the existence of a large regularly organized British colony in Central America, while it does prohibit the United States from having

any possession or colony there. The color for this claim is that, while the stipulation that neither of the two governments should colonize any part of Central America is most conspicuous, the declaration of Sir Henry Bulwer prior to the exchange of the ratifications of the treaty states that "her Majesty does not understand the engagements of that convention to apply to her Majesty's settlement at Honduras or its dependencies." This declaration can not be held to authorize the subsequent colonization by her Majesty's Government of a territory as large as three of our smaller States. The declaration was made not to change or vary the treaty, but of abundant caution that it might not be misunderstood. The meaning of the declaration, we think, is that a mere settlement of British subjects for the purpose of cutting mahogany and logwood at Honduras under Spanish-American sovereignty was not to be considered a British colony, and thus be a violation of the treaty, and I fail to see how, since the exchange of the ratifications of the treaty, the organization of a colony, with a full colonial government under the British sovereignty, can be looked upon as authorized or allowed either by the treaty or by Sir Henry Bulwer's declaration.

The Volcano of Ometepe.—A letter from Nicaragua dated June 12, 1883, said: "The volcano of Ometepe, in Lake Nicaragua, is at present in eruption. On May 1st, at 10 A. M., a frightful and terrifying subterranean rumbling was heard, which lasted between two and three minutes, but no outbreak was visible. On the following day a number of people climbed to the summit of the volcano, to find that the crater had increased in size, and was about thirty-five yards in length and three in width, but its depth could not be calculated. Around it were strewed large quantities of stones and rocks, covered with slate-colored mud; masses of these same materials had poured down in a southwesterly direction, forming a bed three hundred or four hundred yards in length, and ashes were scattered in all directions. Two days afterward, May 4th, a series of terrifying eruptions, accompanied by prolonged rumblings, occurred. At about 2.30 P. M., the earth and rock in the vicinity of the crater were seen to break, lava poured forth, and from it burst upward a thick column of lead-colored smoke, which sent the terrified villagers flying to the churches, in the belief that the whole island was about to be destroyed. Fortunately, however, no damage was done, as the lava followed a direction where there are no inhabitants, and the ground is not cultivated."

On June 19th another, more violent, eruption ended in the formation of a new crater, accompanied by a prolonged earthquake and an overflow of lava in the direction of Las Pilas. Two days later the mountain was rent in various other places, and from these rents red-hot lava flowed in all directions. Many boats were sent to the island from villages on the mainland, to save the unfortunate people. As some of the fugitives had sought shelter on a hill suddenly surrounded by a stream of glowing lava, no help could be extended to them, and they perished in great agony. The island was converted by these eruptions into one mass of liquid ignited lava, and thereby rendered entirely uninhabitable.

NORTH CAROLINA. State Government.—The following were the State officers during the year: Governor, Thomas J. Jarvis, Democrat; Secretary of State, William L. Saunders; Treasurer, John M. Worth; Auditor, William P. Roberts; Attorney-General, Thomas S. Kenan; Superintendent of Public Instruction, John C. Scarborough; Adjutant-General, Johnstone Jones; State Librarian, Sherwood Haywood; Governor's Council, the Secretary of State, Treasurer, Auditor, and Superintendent of Public Instruction; State Board of Education, the Governor, Lieutenant-Governor, Secretary of State, Treasurer, Auditor, Superintendent of Public Instruction, and Attorney-General. Department of Agriculture: Commissioner, Montford McGehee; Secretary, P. M. Wilson; Geologist, Prof. W. O. Phillips; Chemist, Prof. C. W. Dabney; Superintendent of Fish and Fisheries, S. G. Worth. Supreme Court: Chief-Justice, William N. H. Smith, of Wake; Associate Justices, Thomas S. Ashe, of Anson, and Thomas Ruffin, of Orange. Judge Ruffin resigned in September, and A. S. Merrimon was appointed.

Legislative Session.—The Legislature—consisting of 34 Democrats, 15 Republicans, and one Liberal in the Senate, and 70 Democrats and 50 Republicans in the House—convened on January 3d, and adjourned on March 9th. Among the acts passed are the following:

To incorporate the Wilmington, Point Caswell, and Clinton Railroad and Steamboat Transportation Company.

To authorize a sale of the State's stock in the Cape Fear and Yadkin Valley Railway Company, and provide for the speedy completion of the same.

To amend an act to provide for the sale of the State's interest in the Western North Carolina Railroad Company, and for other purposes.

Amending the charter of the Granville Railroad Company.—Changes its name to Atlantic and Western Railroad Company.

To empower counties, townships, cities, and towns to subscribe to the capital stock of the Albemarle and Raleigh Railroad.

To provide a residence for the Governor.

To incorporate the Insane Asylums of the State, and for other purposes.

To change the name of the Edenton and Norfolk Railroad Company to Carolina and Chesapeake Railroad Company.

To amend the charter of the Watauga and Caldwell Narrow-Gauge Railroad Company.—Changes its name to North Carolina and Tennessee Railroad Company.

To facilitate the construction of the Newbern and Beaufort Canal.

To change the fiscal year of the State government, and for other purposes.—Changes time of closing the fiscal year to the 30th day of November.

To provide for the support of the Institution of the Deaf, Dumb, and Blind.

To make appropriations for the several insane asylums of the State.

To incorporate the Black Mountain Railway Co.

To amend the landlord and tenant act.

To change the name of the Elizabeth City and Norfolk Railroad Company to Norfolk and Southern Railroad Company.

To incorporate the Wilmington, Chadbourn, and Conwayborough Railroad Company.

To increase the number of justices of the peace.

To authorize the Seaboard and Raleigh Railroad Company to change its corporate name.

To authorize the registration of the State bonds.

To authorize the Virginia and Carolina Railroad and the Palmetto Railroad Companies to construct and operate their roads within the State.

To repeal the prohibition law of 1831.

To incorporate the Asheville and Burnsville Railroad Company.

The State was divided into nine congressional districts.

Changes were made in the school law, the Board of Agriculture was reorganized, and the Code was adopted. The new Board of Agriculture consists of thirteen members, four *ex officio* and one from each congressional district, chosen by the Legislature. It was constituted as follows: Gov. Jarvis; the President of the State Agricultural Society, T. M. Holt; the President of the University, K. P. Battle; the President of the North Carolina State Grange, W. R. Williams; and by districts: 1. R. W. Wharton, of Beaufort; 2. Dr. Brooks, of Wilson; 3. James A. Oates, of Sampson; 4. W. F. Green, of Franklin; 5. L. W. Anderson, of Stokes; 6. John Robinson, of Anson; 7. A. Leazar, of Iredell; 8. Burwell Blanton, of Cleveland; 9. C. D. Smith, of Macon.

On January 16th Matt W. Ransom, Democrat, was re-elected United States Senator by a vote of 108 against 47 for William Johnson, Liberal.

Resources and General Condition.—There are about 6,500,000 acres of improved land in North Carolina and 16,000,000 of unimproved land. The State produces 450,000 bales of cotton, 30,000,000 bushels of corn, 30,000,000 pounds of tobacco, and exports wheat, rice, oats, ground-peas, etc.

It is estimated that in fifteen counties alone there are now standing 5,000,000,000 feet of long-leaf pine.

When the debt is all arranged it will amount to less than \$3,600,000, bearing 4 per cent. interest. There is, besides, a debt of about \$2,750,000, bearing 6 per cent. interest—the interest of which will be met by dividends from the North Carolina Railroad.

The assessment of property in the State in 1882 was \$168,000,000. The valuation in 1883 shows an increase of nearly 20 per cent. It will reach nearly \$200,000,000. The State and county taxes combined amount to 66½ cents on the hundred dollars.

The crop of corn in 1879 was 28,019,839 bushels; in 1882 it was 84,260,700; the crop of wheat in 1879 was 3,397,395 bushels; in 1882 it had risen to 5,494,800.

The cotton counties raise more corn per inhabitant than the average for the entire State, and pay more per acre for fertilizers.

The State has two coal districts—the Dan river, mainly in Stokes and Rockingham counties, near the middle of its northern boundary; and Deep river, mainly in Chatham county, near the center of the State.

The western half of the State is well dotted

over with valuable iron deposits, most of them wholly untouched. Iron exists in workable beds in thirty counties; but, for convenience, we may group the greater number of the most valuable known mines into four geographical divisions: First, the iron-regions of Granville, Chatham, Guilford and Stokes counties, lying to the north of the center of the State, within reasonable distance of the North Carolina coal-fields. Next the deposits of Gaston, Lincoln, and Catawba counties, lying to the west of the center of the southern border. In the north-west corner of the State, in Ashe, Caldwell, and Mitchell counties, is another series of beds. Finally, in Cherokee county, in the extreme southwest corner of the State, are deposits as yet but little known.

Copper is found in Person, Granville, Davidson, Chatham, and Ashe counties. A large portion of the North Carolina gold-mines, or mines which at the surface carry only gold, grow rich in copper as they approach the water-line, until, in many cases, copper becomes the metal of greatest value. This is especially true of the gold deposits of Guilford, Cabarrus, and Mecklenburg counties.

Gold-mining is now most actively prosecuted in Davidson county, but is carried on also in Rowan county.

Finances.—The chief items in the receipts are:

Public taxes.....	\$528,751 84
Tax on bank-stock.....	3,185 01
Sale of Confederate States bonds.....	2,527 50
From Western North Carolina Railroad.....	29,460 00
Drummers' license-tax.....	53,200 00
Fees from Secretary of State.....	6,148 00
Fertilizers, license-tax.....	42,000 00
Tax on insurance companies.....	18,198 98
Interest on bonds of Western North Carolina Railroad.....	59,500 00
Sewing-machine license-tax.....	2,400 00
Stationery, from counties.....	2,725 59
Other items swell the total receipts to.....	763,881 44

DISBURSEMENTS.

Agricultural Department.....	\$48,500 00
To disabled Confederate soldiers.....	1,690 00
Contingent expenses.....	17,394 00
Convict account, expense of conveying to Penitentiary.....	9,051 21
Department of Public Instruction.....	2,184 80
Auditor's Department.....	2,975 96
Executive Department.....	4,800 00
Fugitives from justice.....	1,955 30
Insane Asylum, Raleigh.....	65,500 00
Insane Asylum, Morganton.....	65,000 00
Insane Asylum, Goldsboro.....	29,000 00
Institutions for Deaf, Dumb, and Blind.....	84,000 00
Interest on consolidated debt of the State.....	88,370 00
Interest on bonds of Western North Carolina Railroad.....	59,555 00
Judiciary.....	38,089 09
Normal schools.....	6,500 00
Oxford Orphan Asylum.....	5,000 00
Penitentiary.....	110,000 00
Public printing.....	11,999 74
Quarantine regulations.....	1,451 55
Roster of State troops in Confederate service.....	3,018 00
Department of State.....	4,548 05
Treasury Department.....	6,445 99
University of North Carolina.....	12,000 00
Other items swell the total disbursements to.....	629,113 87

The item of \$58,555 paid out on account of interest on the mortgage bonds of the Western North Carolina Railroad is offset by the item of \$59,500 received from that company for

that purpose. The item of \$29,460 received from the Western North Carolina Railroad is the money paid for the convicts. The actual disbursements were, then, \$570,000.

Education.—The receipts from taxation for schools in 1882 were \$421,499.89, of which the polls paid \$174,732.97, and property \$162,095.88. There was derived from licenses \$51,662.87, from fines and penalties \$18,205.98. There was on hand from 1881, \$292,628.28.

There are 463,160 (176,886 colored) children of school age in the State, of whom 233,071 (88,286 colored) were enrolled as pupils. This shows an enrollment of only 50 per cent. of the children. The average attendance was only 182,546, or about 28 per cent. The number of schools taught were 3,578 white schools and 1,750 black. The average length of the school terms was three months. The pay of the white teachers averaged \$24 a month, and that of the colored teachers \$20 a month. The number of teachers was 5,178.

Congressional Election.—On Nov. 20, an election was held in the first district to fill the vacancy occasioned by the death of Walter F. Pool. The Democratic candidate was Thomas G. Skinner; the Republican candidate, Charles C. Pool. Mr. Skinner was elected by a majority of 777. Mr. Skinner's seat was contested, on the ground chiefly that he was elected from the new district, and not from the district in which the vacancy existed. The old district included Bertie, a Republican county, for which Carteret, a Democratic county, had been substituted in the new.

NOVA SCOTIA, an eastern province of the Dominion of Canada. Area, including Cape Breton, 21,731 square miles. Capital, Halifax. The peninsula is the "Acadia" of early French settlement. Cape Breton island forms part of the province, being separated from it only by the narrow strait of Canso.

Soil and Climate.—Unlike its sister province on the west, Nova Scotia has an excellent soil; but, also unlike it, possesses a very foggy climate, which renders the ripening of wheat difficult. Neither of these provinces depends on farming for a revenue, or even for anything more than a means of livelihood. Nova Scotia has an equable temperature throughout the year. The chief drawback is the fogs along the Atlantic coast. These are caused by the shore or cold currents from the north encountering the Gulf Stream. The colder waters sink under those of the Gulf Stream, and thus do not affect the climate directly. The ports are open throughout the winter, and ferries run continually to and from Prince Edward island.

Ports.—In order of importance, the ports of Nova Scotia rank as follow: Halifax, Yarmouth, Pictou, Truro, Sydney, Windsor, Antigonish, Amherst, Annapolis, Cornwallis, Lunenburg, Digby, Weymouth, Pansboro, Lockeport, Arichat, Baddeck, Barrington, Bridgetown, Guysboro, Liverpool, Londonderry, Margaretsville, Hawkesbury, Hood, Medway, Shel-

burne, and Oanso. These places carry on a considerable trade, both coasting and foreign.

Fisheries.—The total export of the produce of Nova Scotia in 1882 was \$8,860,769, of which \$4,437,864 belongs to fisheries; \$2,661,118 of this is on account of dry salted codfish; \$32,854 of wet salted codfish; \$840,761 of pickled mackerel; \$296,761 of pickled herring; \$816,612 of preserved lobsters. The United States received \$1,353,773 of the whole value; Great Britain, \$635,437; British Guiana, \$150,415; West Indies, \$2,141,743.

Lumbering.—The exports of the forest amounted to \$1,587,947. Of this, \$120,664 consists of fire-wood, shipped to the United States; \$22,744, hop and telegraph poles; \$745,517 of lumber, deals, etc.; \$495,262 of planks, boards, etc.; \$20,584 of masts and spars; \$21,427 of shingles; \$28,827 of railway-ties; \$42,316 of birch square timber, etc.

Farming.—The export product of grazing reached the sum of \$836,052; of agriculture, \$880,804—a total of \$1,666,856. Of this, \$127,382 is fruits exported to England; \$590,447 is potatoes, nearly all to the United States; \$15,612 is oats, etc.

Mining.—The mining products of Nova Scotia consist chiefly of coal, gypsum, manganese, and marble. The coal exports were \$328,493 for 196,905 tons; manganese-ore, \$17,796; crude gypsum, \$106,856; marble, \$16,253.

Manufactures.—These amount to only \$437,503, and are chiefly: leather, \$153,542; ships, \$63,171; grindstones, \$14,793; junk and oakum, \$14,285; boots and shoes, \$24,476.

Education.—The essential features of the system of public education in Nova Scotia were incorporated in the provincial statutes in 1865. Under the provisions of the "Act relating to Public Instruction," the supreme control of the schools is vested in the Executive Council, which, when dealing with educational matters, is known in law as the Council of Public Instruction. The Superintendent of Education, who is appointed by the Lieutenant-Governor, is chief administrative officer.

The local management of the schools is intrusted to a board of three trustees in each section. The trustees are elected in annual meeting by the rate-payers of the section. They have power to employ and dismiss teachers, and are a body corporate for the prosecution and defense of all actions relating to the school or its affairs.

The law provides for the establishment in each county town of a superior institution, under the designation of County Academy. Practically this name denotes the most advanced, or high school, department of the

town schools. The regulations require that this department shall be open, free of charge, to all youth of the county who are able to pass a specified entrance examination. A county academy receives from the Legislature a maximum grant of \$600 annually.

The Provincial Normal School occupies magnificent premises at Truro, almost the exact geographical center of the province. Connected with the normal school are excellent model schools. The average attendance of pupil-teachers is about 120.

Regulations of the Council of Public Instruction provide for the organization of a Provincial Educational Association and of Teachers' Associations in the various inspectorial districts. The Department of Education issues semi-annually a "Journal of Education," which is the medium of all official notices emanating from the Council of Public Instruction.

The report of the Superintendent of Education for 1882 shows the attendance during that year to have been as follows: Winter term, 76,888; summer term, 81,119. The total number of pupils registered during the year was 95,912. The number of teachers employed during the winter term was 1,890. The total expenditure on public schools for the year was \$571,889.64.

In 1883 the Legislature passed "an act to secure better attendance at the public schools," which embodies the principle of compulsory education. It has a local-option clause. The province possesses excellent institutions for the training of deaf-mutes and the blind.

The collegiate or university system of Nova Scotia is chiefly denominational. There are five institutions that confer degrees. The oldest of these, under the control of the Church of England, is the University of King's College at Windsor, founded in 1788, and granted a royal charter by George III in 1802. Dalhousie College, Halifax, is a quasi-provincial institution. Its resources have received large additions during the past few years. It was originally founded in 1828 by the Earl of Dalhousie, but its true history as a university dates from 1862, when it received from the Legislature its present constitution. Acadia College, Wolfville, is under the management of the Baptist denomination. It was founded in 1844. St. Francis Xavier College, Antigonish, and St. Mary's College, Halifax, are Roman Catholic. For many years the question of grants to denominational colleges provoked much controversy, excited much bitter feeling, and had an important bearing in some cases on the fate of governments and parties. In 1881 it was decisively settled by the withdrawal of grants from all the colleges.

OBITUARIES, AMERICAN. **Atwater, Lyman H.**, an American clergyman, born in New Haven, Conn., Feb. 20, 1818; died in Princeton, N. J., Feb. 17, 1888. He was graduated at Yale College in 1831, entered Yale Theological Seminary, and was licensed to preach in 1834. He became pastor of the Congregational society in Fairfield, Conn., where he served for nearly twenty years, and was known as a contributor to religious periodicals. In 1854 he was appointed Professor of Philosophy in Princeton College, with which institution he continued his connection until his death. He edited the "Princeton Review" for several years.

Baker, William M., an American novelist, born in Washington, D. C., in 1825; died in South Boston, Mass., Aug. 20, 1888. He was graduated at Princeton College, at the age of twenty-one, studied theology there, and then, joining his father in Texas, was a pastor in Galveston, and subsequently in Austin, from 1850 to 1865. After fifteen years of service in Texas, Mr. Baker accepted a charge at Zanesville, O., whence he was transferred to Newburyport, Mass. In 1874 he became pastor of a Presbyterian church in South Boston. Although earnestly devoted to his duties as a minister, Mr. Baker found time for contributing frequently to periodicals. His most important work was "Inside: A Chronicle of Secession" written secretly during the war, while he lived in Austin, and giving a peculiarly vivid picture of Southern life and sentiment at that time. It was published anonymously. His other works include "The Virginians in Texas," "The New Timothy," and "His Majesty Myself." His latest work was entitled "The Ten Theophanies, or, the Manifestations of Christ before his Birth in Bethlehem." It was completed shortly before his death, and is regarded by those who knew him as in some sort a record of the writer's own religious experiences and struggles.

Barnes, Joseph K., Surgeon-General of the United States Army, born in Philadelphia July 21, 1817; died in Washington, D. C., April 5, 1888. He studied in the medical department of the University of Pennsylvania, and was graduated in 1838. For two years he was engaged in practice in his native city, and in 1840 was appointed an assistant surgeon in the army, and assigned to duty at West Point. At the close of 1840 he was transferred to Florida, where for two years he was connected with Gen. Harney's expedition against the Seminoles. Thence, in 1842, he went to Fort Jessup, Louisiana, where he served four years. When the Mexican War began, Dr. Barnes was appointed chief medical officer of the cavalry brigade, and he was in active service all through the war. He was assigned to duty again at West Point in 1854, and remained

there for several years. At the outbreak of the civil war, Surgeon Barnes, then in Oregon, was among the first summoned to Washington. In 1861 he was assigned to duty in the office of the surgeon-general at Washington, where his experience in field and hospital service was of great value. Two years later he was appointed to a medical inspectorship, with the rank of colonel, and in September, 1863, he was promoted to fill the vacancy in the surgeon-general's department, with the rank of brigadier-general. He served with honor during the war, and in 1865 was brevetted major-general. He was placed on the retired list the year before his death.

Beard, George Miller, an American physician, born in Montville, Conn., May 8, 1839; died in New York, Jan. 23, 1888. He was graduated at Yale College in 1862. His medical training was obtained partly at Yale, but chiefly at the College of Physicians and Surgeons, New York, where he obtained his degree in 1866. From this time he gave special attention to diseases of the nervous system. He also introduced several new methods of electrization, and was the first to point out and exemplify the tonic effects of electricity. In 1867 he published, with Dr. Rockwell, a work on "General Electrization," and in the same year a valuable paper on "The Longevity of Brain-Workers." Dr. Beard, during a comparatively short life, made many contributions to the literature of his profession, in part by translation and in conjunction with others. He was a diligent student, and clear and forcible writer. In 1871 he published, with Dr. Rockwell, "Medical and Surgical Uses of Electricity," and the same year issued two popular treatises on "Stimulants and Narcotics," and on "Eating and Drinking." In 1874 he entered upon a careful examination of animal magnetism, spiritualism, clairvoyance, and mind-reading, in their relation to the nervous system. He explained the performances of the somewhat famous Eddy brothers, and also of Brown the "mind-reader," maintaining that what was called mind-reading was the unconscious action of mind on body. Dr. Beard also studied carefully the functional nervous disease known as inebriety; and in 1879, when he was a delegate to the British Medical Association at Cork, he presented a paper on "Inebriety and Allied Nervous Diseases of America." Besides frequently contributing to periodical literature on topics relating to psychology and the nervous system, he delivered popular lectures on psychological and neurological subjects.

Berrien, John M., an American naval officer, born in 1802; died in Philadelphia, Nov. 20, 1888. On receiving his appointment as midshipman, he joined the frigate *Constellation*; subsequently he was transferred to the sloop

of war John Adams, then to the frigate *Guerrière*, and afterward to the frigate *Brandywine*. Having served in other vessels also, he received his commission as lieutenant, Feb. 9, 1837, and in August of the following year he joined the West India squadron in the sloop of war *Natchez*. In September, 1844, he was ordered to the frigate *Potomac*, and in 1847 was in command of the schooner *Bonito*, at the capture of the city of Tabasco, Mexico. Lieut. Berrien received his commission as commander, March 13, 1856, and during 1858-'59 was attached to the navy-yard, Portsmouth, N. H. In February, 1860, he was ordered to Hong-Kong, China, where he took command of the sloop of war John Adams; and two years later he was sent to Pittsburg, Pa., as assistant inspector of ordnance at the Fort Pitt Works. He was raised to the rank of captain in August, 1862, and in September, 1864, was ordered to the ironclad *Monadnock* at Boston. Toward the close of the year he was sent to the Norfolk navy-yard. He was commissioned commodore, Sept. 20, 1866, and in December was placed on the retired list.

Blair, Montgomery, an American statesman, born in Franklin co., Ky., May 10, 1813; died at Silver Spring, Md., July 27, 1888. He was graduated at West Point Academy in 1835, and served under Gen. Scott in the Seminole War. He then studied law, and was admitted to the bar in 1839. He was appointed District Attorney for Missouri, in 1842 was elected Mayor of St. Louis, and was raised to the bench the next year. This position he resigned in 1849. Three years after, he removed to Maryland, and entered upon the practice of law. He was engaged in important cases in the United States Supreme Court, and was one of the counsel in the famous *Dred Scott* case. He was appointed by President Pierce to the court of claims. Judge Blair left the Democratic party on the repeal of the Missouri Compromise, and for this was removed from his seat by President Buchanan. In 1860 he presided in the Republican Convention of Maryland, and in 1861 was appointed by President Lincoln Postmaster-General. He served in this office with signal ability and success. He prohibited sending disloyal papers through the United States mails, in which he was sustained by Congress, and introduced various reforms and improvements in his department, such as money-orders, free delivery in cities, postal railroad-cars, etc. Three years afterward (1864) he resigned from the Cabinet, and rejoined the Democratic party, to which he adhered for the rest of his life. He supported Mr. Tilden for the presidency, and subsequently attacked with much vigor President Hayes's title to office. Although he favored Mr. Tilden's candidacy again in 1880, he supported Gen. Hancock, the regular candidate of the party. Judge Blair was a man of simple, quiet habits and tastes. He was specially fond of country life, and, having abundant means, he

supported a fine farm and place at Silver Spring, Md. His wife, together with three sons and one daughter, survives him.

Brooks, Charles Timothy, an American scholar, born in Salem, Mass., June 20, 1818; died in Newport, R. I., June 14, 1883. He was graduated at Harvard College in 1832, and in 1837 was settled as a Unitarian minister in Newport, where he spent the rest of his life. Mr. Brooks published several original works, and was distinguished as a translator from the German. In 1851 he issued a pamphlet on "The Controversy touching the Old Stone Mill" at Newport. He translated Schiller's "William Tell," "German Lyrics," etc.; Goethe's "Faust"; and Richter's "Titan," "Hesperus," and other works.

Cassery, Eugene, a United States Senator, born in Ireland, in 1822; died in San Francisco, Cal., June 14, 1888. His parents emigrated to New York when he was only two years old, and as his father was devoted to the business of teaching, young Cassery received in boyhood an excellent education. He was graduated at Georgetown College, D. C., entered a lawyer's office in New York, and was admitted to the bar in 1844. He was corporation attorney in 1846-'47. Three years later Mr. Cassery removed to San Francisco, where he built up a good practice, and took an active part in local and national politics. He was an ardent Democrat, was a capital stump-speaker, and for a time edited a paper in San Francisco. He was elected State printer; but, in consequence of a heavy fire by which his machinery and stock were destroyed, he was compelled to retire from the business. Thenceforward he devoted himself to his proper profession, and took high rank among the lawyers in California. During the civil war he sided with that portion of the party which upheld the Union. In 1869 he was elected United States Senator from California. He served on the committees of Printing, Public Lands, and Foreign Relations. His health having become infirm, Senator Cassery resigned in November, 1873, and returned to San Francisco and resumed practice. Of late years his declining strength was evident, and he died of nervous prostration and softening of the brain.

Clarke, William T., an American journalist, born in Walpole, Mass., Oct. 1, 1829; died in New York, Dec. 11, 1883. He worked on his father's farm, and subsequently studied for the ministry at Meadville and Cambridge. He was ordained at Hingham, Mass., in 1855, and preached for some years at Haverhill and Chelsea. In 1866 he came to New York, and entered upon journalism as his special work. He edited "The Liberal Christian" for four years, and became associated with Theodore Tilton in "The Golden Age." He also was connected with "The Graphic," and "The Evening Express." In 1882 he entered into service with "The New York Star," and was its chief writer. Mr. Clarke wrote readily and

forcibly, and he was correspondent of several journals in the country.

Coan, Titus, an American missionary, born in Killingworth, Conn., Feb. 1, 1801; died at Hilo, Hawaii, Dec. 1, 1882. He was a cousin and townsman of Asahel Nettleton; but, though influenced by the great revivals that followed the preaching of Mr. Finney, he did not unite with the church until 1828. He entered the second class of Auburn Theological Seminary in 1831, and in 1833 was graduated and licensed to preach. On the 16th of August he sailed for Patagonia with one companion, the Rev. Mr. Arms, to explore the country, with a view to the possible establishment of a mission. In the straits of Magellan they sighted the Beagle, in which Charles Darwin was making his famous voyage of scientific exploration. The savages sought to detain the venturesome missionaries among them, and they barely escaped with their lives, after three months of exploration among the Patagonian tribes in the region of Gregory's Bay. A passing ship took them off and landed them at New London in May, 1834. On the 3d of November following, Mr. Coan married Miss Fidelia Church, of Churehville, N. Y., and on Dec. 24, 1834, the young missionaries sailed, with six others, in the ship *Hellespont* from Boston for the Hawaiian islands, *via* Cape Horn. They arrived at Honolulu June 6, 1835, and at Hilo, which was to be their mission-station and their home for life, July 21st. For two years Mr. Coan gave himself chiefly to the study of the Hawaiian language, and he attained great power as a speaker. His district comprised the entire provinces of Hilo and Puna, extending 100 miles along the eastern coast of Hawaii. Throughout this wild and beautiful country he made frequent tours on foot; an era of revivals soon began, and, from 1838 to 1840, 7,000 of the natives were converted. He organized churches and schools throughout his district, and Mrs. Coan carried on for some years a school for native girls at Hilo. During his forty-six years of missionary work, he received 14,000 Hawaiians into the Hilo and Puna church. He was for many years President of the Hawaiian Evangelical Association. His great success was largely owing to the aid and wisdom of Mrs. Coan, who died exhausted by overwork in 1872. (For a sketch of Mrs. Coan's life, see the "Annual Cyclopædia" for 1872, p. 629.) In 1860, and again in 1867, Mr. Coan made a tour of the missions in the Marquesas islands. In 1870 Mr. and Mrs. Coan visited the United States. Mr. Coan was for forty years the chief source of information respecting the great volcanic eruptions of Kilauea and Mauna Loa, of which he was an ardent and constant student. His descriptions of volcanic phenomena were published in many different journals from 1841 to the year of his death. From 1851 to 1880 he was a frequent contributor to the "American Journal of Science." His published books are autobiograph-

ical; they are, "Adventures in Patagonia" (New York, 1860), and "Life in Hawaii" (New York, 1882). Four children survive him.

Davidson, Thomas G., an American lawyer, born in Jefferson co., Miss., in 1805; died on his farm in Livingston parish, La., Sept. 11, 1888. He was admitted to the bar in Louisiana, in 1827, and was elected to the Legislature in 1832. He was re-elected successively until 1858, when he was sent to Congress. He served in Congress till 1861, when with other secessionists he withdrew. After the civil war, he served again in the Legislature of Louisiana; but during the latter years of his life he was permanently disabled.

Ewer, Ferdinand C., an American clergyman, born in Nantucket, Mass., May 22, 1826; died in Montreal, Canada, Oct. 10, 1888. He was graduated at Harvard College in 1848. His parents were Unitarians, but he was baptized by the rector of the Episcopal Church in Nantucket. This gentleman was one of the earliest of the so-called "ritualists," and young Ewer entered zealously into the novelties in worship of that day in the Episcopal Church. It was Mr. Ewer's purpose to enter the ministry, but for a time he was involved in "deep waters," and doubted whether there was any truth at all in Christianity. Instead of the ministry, he chose as his profession civil engineering, and in 1849 sailed for California by way of Cape Horn. There being no demand for engineering services, he engaged in journalism, and for eight years was busily occupied in this kind of work. He was ordained deacon in 1857, and priest in 1858. He soon after became rector of Grace Church, San Francisco, where he labored diligently for two years. His health having become impaired, he returned to the East in 1860, was for a while assistant minister in St. Ann's Church, New York, and in 1862 was chosen rector of Christ Church. Here he began the introduction of practices not usual in Episcopal churches, which after a time created disturbance among the people, and the rector felt it best to resign his charge. This was in 1871, when some friends organized a new parish for him by the name of St. Ignatius. Here he was at liberty to carry out fully his views as to doctrine and ritual, and he became the foremost champion of what he called "catholic" principles. Dr. Ewer was a man of genial spirit and temper, and was an able writer on theological and controverted points. While preaching in St. John's Church, Montreal, Sunday, October 7th, he was stricken down with paralysis, and he died the third day after.

Ewing, Charles, an American general, died in Washington, D. C., June 20, 1888. He was brother-in-law to Gen. W. T. Sherman, on whose staff he served. At the outbreak of the civil war, he took a position in the regular army as captain of the Thirteenth Infantry. He was brevetted major in 1863 for services at the siege of Vicksburg; brevetted lieutenant-

colonel in 1864, for services in the Atlanta campaign; and again, in 1865, was brevetted colonel for gallant and high soldierly conduct during the war. He resigned in 1867, and took up his residence in the city of Washington, where he practiced law. He was a brother of General Thomas Ewing.

Foster, Charles J., an American editor, born in Bicester, England, Nov. 24, 1820; died in Astoria, N. Y., Sept. 12, 1888. He came to the United States in 1847, and, after residing in Boston for some time, he went to Cincinnati and Columbus, O. Mr. Foster was intimately acquainted with the turf in all its belongings, and he was said to be the best-informed man in the country on the subject of racing. He wrote for "The Spirit of the Times," and in 1876 established "The New York Sportsman," which he edited till his death.

Gardiner, Addison, an American jurist, born in Rindge, N. H., March 19, 1797; died in Rochester, N. Y., June 5, 1888. In 1809 his father removed to Manlius, N. Y., where the youth acquired his education and studied law. While yet a young man, in 1822, Addison Gardiner removed to Rochester, N. Y., which thenceforward became his home for life. He was the first justice of the peace in Rochester, and in 1825 was appointed district attorney for Monroe county. Four years later he was commissioned by Gov. Throop as Circuit Judge for the Eighth Circuit, comprising eight counties in western New York. His ability as a judge was conspicuous, and he rose high in the esteem of the profession. He resigned this post in 1838, and resumed the practice of law in Rochester, in partnership with the late M. F. Delano. He was nominated and elected Lieutenant-Governor of New York in 1844 on the Democratic ticket, and was re-elected in 1846. His position as presiding officer in the State Senate was important and well sustained, especially in view of the various law questions which came up for settlement by the Court of Errors, of which he was *ex officio* a member. In 1846 Judge Gardiner was elected Judge of the Court of Appeals, which was made the highest appellate court in the State, and thereupon resigned his lieutenant-governorship. He served in this high position for the long term, reaching to the end of 1855, when he declined being renominated. His superior qualities as a well-trained, clear-headed lawyer led to his being largely occupied in referee cases during the latter years of his life, and so admirable were his decisions that they were rarely reversed on appeal. Judge Gardiner was married in 1831; his wife died some years ago, and he leaves a son and a daughter.

Garthwaite, Jeremiah C., an American merchant, born in Elizabeth, N. J., in 1807; died in Newark, N. J., Feb. 16, 1888. Mr. Garthwaite was engaged in mercantile pursuits in Newark, N. J., and in New Orleans, by which he amassed large means, which he liberally distributed. He was elected to the Common

Council of New York in 1850. He suggested various reforms, and worked hard to carry them out; but, finding it to be useless, he retired from public life. He was specially prominent in Episcopal Church affairs in New Jersey, was a delegate to the General Convention of the Church for more than twenty-five years, and exercised large influence. His wife, a daughter of Gen. Darcy, survives, but he left no children.

Gargas, Jeshiah, an American soldier, born in Pennsylvania in 1818; died in Tuscaloosa, Ala., May 15, 1868. He was graduated at West Point Academy in 1841, and served through the Mexican War with much credit, rising to the rank of captain. At the outbreak of the civil war, he resigned his commission, and tendered his services to the Confederate Government. He was placed at the head of the ordnance department, with the rank of brigadier-general. After the fall of the Confederacy he devoted himself for a time to business. In 1872 he was elected Vice-President of the University of Tennessee at Sewanee, and in 1878 was invited to the presidency of the University of Alabama. This post he held until failing health, some years ago, compelled him to relinquish it. Subsequently he resided in Tuscaloosa, discharging the lighter duties of librarian of the university.

Greene, George Washington, an American author, born in East Greenwich, R. I., April 8, 1811; died Feb. 2, 1888. He was a grandson of Gen. Nathanael Greene. His educational training was received at Brown University, and a few years after his graduation he was appointed United States consul at Rome, which office he held from 1837 till 1845. On returning home in 1847, he was made Professor of Modern Languages in Brown University. In 1872 he was appointed Professor (non-resident) of American History in Cornell University. Mr. Greene was the author of valuable historical works, as "The Life of General Nathanael Greene" (2 vols., 1867-'68); "Historical View of the American Revolution" (1865), etc. He also contributed largely to periodical literature, and was occupied in preparing a biography of Longfellow. This last was mainly a labor of love, he being on intimate terms with the distinguished poet.

Hastings, Hugh J., an American journalist, born in the north of Ireland, Aug. 20, 1820; died at Monmouth Beach, N. J., Sept. 12, 1888. He came to the United States when a boy eight years old, and settled with his family in Albany, N. Y. Being an active youth, with a decided taste for journalism, he began his career as reporter for the Albany "Atlas." Not long after, he began the publication of a newspaper of his own, entitled the "Knickerbocker," which proved a success, and grew in time to be a valuable property. Mr. Hastings took an active and energetic part in State and national politics, devoting himself to the interests of the Whig party and its successor, the Republican

party. He was appointed, by President Taylor, Collector of the Port of Albany, but resigned the office under Fillmore. In 1868 he assumed the editorship of the New York "Commercial Advertiser," and ere long gave it a tone and character which were as striking as they were effective. The paper increased largely in circulation, and did good service to the cause in which Mr. Hastings's deepest convictions were enlisted. He was a warm supporter of Gen. Grant; criticised Mr. Hayes's administration; and, on President Arthur's taking the lamented Garfield's place, he rendered him all the help in his power. His death was mainly the result of his being thrown from his phaeton, while driving along Broadway, Long Branch. His wife and two daughters survive him.

Hatfield, Edwin F., an American clergyman, born in Elizabethtown, N. J., Jan. 9, 1807; died in Summit, N. J., Sept. 22, 1883. He was graduated at Middlebury College, Vermont, in 1829, and then spent two years at Andover Seminary. He was ordained in May, 1832, by the United Presbytery of New York, and directly after became pastor of the Second Presbyterian Church in St. Louis, Mo. Three years later he removed to New York city, and took the pastorate of the Seventh Presbyterian Church, which post he held for twenty-one years (1835-'56). Dr. Hatfield was a delegate of the New School Presbyterians in 1846; was elected stated clerk; was re-elected every year until the union of the two schools again in 1870, when he was elected to the same office; and continued in this responsible trust until the last year, when he was elected moderator. Owing to ill health he stopped preaching in 1863, and was financial agent of the Union Theological Seminary for several years. He was very successful in raising funds for the institution. Dr. Hatfield published "Universalism as it is" (1841), "St. Helena and the Cape of Good Hope" (1852), "History of Elizabeth, N. J." (1868), "The Church Hymn Book," and "The Chapel Hymn Book" (1872-'73).

Head, Nath., Governor of New Hampshire, born in Hooksett, N. H., May 20, 1828; died there, November 12, 1883. He received his early educational training at Pembroke Academy, and when he became of age he entered actively and zealously upon agricultural and other pursuits. He took deep interest also in the military affairs of the State, in connection with the service of the troops during the civil war. In 1876 he was elected State Senator by a large majority, and in 1878 was chosen Governor of New Hampshire. He served out his term of two years with great acceptance, and was not a candidate for re-election. Gov. Head was prominent in the Masonic and Odd-Fellowship ranks, was Vice-President of the Historical Society, and a director in various savings-banks, insurance companies, railroads, etc. He was highly esteemed for his integ-

riety, his genial spirit, his love for his native State, and his unflinching efforts to promote peace, good-will, and prosperity among his fellow-citizens.

Jeffers, William N., an American naval officer, born in Gloucester co., N. J., in 1823; died in Washington, D. C., July 23, 1883. Mr. Jeffers was destined by his parents for the law, but exhibiting early a taste for the sea, he was appointed midshipman Sept. 25, 1840. His first cruise was in the Pacific, under Commodore A. C. Jones, and he took part in the capture of Upper California by the forces commanded by that officer in 1842. When the Mexican War broke out he was ordered to the steamer Vixen, and was a participator in all the naval operations in the Gulf. In 1852 he was selected by Commodore Perry to accompany the Japan Expedition; but, as the vessel to which he was assigned (the Princeton) proved to be unfit for service, he was given leave of absence, and joined E. G. Squier in his exploring expedition into Honduras. In the autumn of 1858 he was ordered to the Brazil squadron, and took part in the exploration of the La Plata river. While he was thus occupied his vessel was fired upon by a Paraguayan battery, which he gallantly attacked and silenced. During his command of the Water Witch he rescued from wreck the Spanish steamer Cartagena, which service was acknowledged by the Queen of Spain, in the presentation of a handsome sword. He was next assigned to the ordnance-ship Plymouth, stationed in the Gulf to protect the American flag. Obtaining leave of absence, he was again with Mr. Squier in Honduras, as hydrographic engineer. On his return he served in the war-steamer Brooklyn on the coast of Mexico for two years, and subsequently as one of the commissioners on the "Chiriqui grants" in New Granada. During the civil war his most noted service was as commander of the Monitor, when Lieut. Worden had been disabled. After that time he was occupied chiefly on shore-duty.

Kirkbride, Thomas S., an American physician, born near Morrisville, Pa., July 31, 1809; died in Philadelphia, Dec. 16, 1863. He received his educational training at Trenton, N. J., after which he entered the medical department of the University of Pennsylvania, and obtained the degree of M. D. in March, 1833. He was immediately appointed resident physician at the Quaker Insane Asylum, Frankford, where he remained for a year, and then took the same post in the Pennsylvania Hospital for two years. For several years after this he was engaged in private practice in Philadelphia. In the autumn of 1840 he was elected superintendent of the new Institution for the Insane (now connected with the Pennsylvania Hospital), and remained at its head until his death. Dr. Kirkbride stood high in the profession in his speciality; he was a member of numerous medical societies, author of several valuable books, and contri-

butions to medical journals; and a most estimable man.

Knox, Samuel R., an American naval officer, born in Charlestown, Mass., Aug. 23, 1811; died in Boston, Nov. 22, 1888. He entered the navy as midshipman in 1828; served in the Mediterranean and Pacific, under different commanders; and was in the United States Exploring Expedition, under Commodore Wilkes, from 1838 to 1842. While in command of the schooner Flying-Fish, he approached nearer to the south pole than any other vessel in the squadron. "Knox's High Land," in that locality, was named in honor of the young officer. In the Mexican War he assisted in the capture of the castle of San Juan de Ulloa; and in the civil war he was attached to the blockading squadron in the Gulf of Mexico. He had been for several years on the retired list.

Le Conte, John Lawrence, an American scientist, born in New York, May 13, 1825; died in Philadelphia, Nov. 15, 1888. He was graduated in 1846 at the New York College of Physicians and Surgeons. While a student he made scientific excursions into the Western States, and afterward extended his travels into Central America. Of these excursions and travels he furnished interesting accounts for various scientific societies and journals. Dr. Le Conte's special study was the North American *Coleoptera*, in which department he was regarded as a high authority. The Smithsonian Institution at Washington published his classification of the Coleoptera of our country, in 1861-'62, and in 1863-'66 his "List of Coleoptera of North America." Dr. Le Conte entered the army as surgeon of volunteers in 1862, and subsequently became medical inspector in the regular army. He was a member of numerous learned societies, and in 1873 was elected President of the American Association for the Advancement of Science. He contributed largely to scientific periodicals, and was chief clerk in the United States Mint, Philadelphia, at the time of his death.

Macfarlane, Robert, an American editor, born in Rutherglen, near Glasgow, Scotland, April 23, 1815; died in Brooklyn, N. Y., Dec. 21, 1888. His early education was limited, but having a taste for reading he made respectable acquirements in subsequent years. Having learned his father's trade, that of a dyer, at Paisley, he emigrated, in 1836, to the United States. He took up his residence in Albany, N. Y., in 1840, and made his mark there as editor of a paper published in the interests of the working classes. This led to his appointment, in 1848, as editor of the "Scientific American," which post he held for seventeen years with decided ability. Being threatened with failure of eyesight, he gave up literary work in 1865, and returning to Albany engaged in the business of dyeing. In 1874 he retired from the business, in favor of his two sons, and thenceforward resided mostly in Brooklyn. He revisited his native land twice, and wrote pleasant

sketches of his travels and experiences. He was author of a "History of the Screw-Propeller," and edited a "Treatise on the Art of Dyeing." He was also devoted to Scottish antiquities, and to the history of Scottish emigration to America.

McKeon, John, an American lawyer, born in Albany, N. Y., in 1808; died in the city of New York, Nov. 22, 1888. His father was a naval officer of distinction in the War of 1812. He was graduated at Columbia College, and studied law in the office of John L. Mason. He was elected to the Assembly, on the Democratic ticket, and served in that position during 1882-'84. He was next elected to Congress, where he served from 1885 to 1887, and again from 1841 to 1848. He was appointed District Attorney of the County of New York early in 1846, and the following year (the office having become elective) he was elected for the full term of three years. He was resolute in the discharge of his duties, as was proved by his prosecution of a notorious malpractitioner, Madame Restell, and securing a conviction, and by his determined hostility to criminals of all sorts. He was appointed by President Pierce as successor for the unexpired term of Charles O'Connor as United States District Attorney for the Southern District of New York. After this he resumed the practice of law, and associated with himself Frederick Smyth as partner in 1858. While United States District Attorney he was engaged in prosecuting a number of well-known and important cases, such as the attempt to enlist men to serve in the British army in the Crimean War, the seizure of the "flibustering" ship Northern Light, the trial of officer Westervelt, taken on board the ship Nightingale by Government cruisers, the ship having in her hold 960 slaves. Mr. McKeon was a Democrat always and everywhere, sometimes in the majority with the Tammany-Hall wing, quite as often in the minority with its opponents. Although well advanced in years, he was nominated for District Attorney in the autumn of 1881, and was elected to the same office he had held more than thirty years before. Mr. McKeon married a daughter of Capt. Sloat, of the United States Navy. His wife and one daughter survive him.

McMullen, John, an American clergyman, died in Davenport, Iowa, July 8, 1888. He was graduated in Chicago in 1854, and the same year went to Rome, where he studied for the priesthood, and was ordained in 1858. He returned to Chicago in the same year, and was appointed pastor of a St. Louis church. In 1861 he became President and Rector of the Roman Catholic University of St. Mary's of the Lake, and in 1863 began the erection of the new university building, which was afterward destroyed in the great fire. Dr. McMullen was for a time at Wilmington, Ill., but was summoned back to Chicago in 1870, to take charge of the Cathedral of the Holy Name. In 1877 he was appointed vicar-general of the diocese,

and in 1880, when a new diocese was formed by the title of Davenport, Iowa, Dr. McMullen was appointed its bishop. The remainder of his life was spent in the work thus assigned to him. He wrote largely on church history, polity, etc. He was incessant in labor, and confirmed in one year 6,000 candidates.

Martin, Benjamin N., an American scholar, born in Mount Holly, N. J.; died in New York, Dec. 26, 1888. His early education was obtained at the academy, Trenton, N. J., and he was graduated at Yale College in 1837, in the same class with Chief-Justice Waite, the Hon. W. M. Evarts, and Profs. Lyman and Silliman, of New Haven. Mr. Martin next entered the Yale Theological Seminary, and, on graduating in 1840, he supplied for 1841-'42 the pulpit of the Carmine Street Presbyterian Church, New York (now in Forty-second street). The following year he became pastor of the Congregational Church in Hadley, Mass., where he remained till 1847. During 1848-'49 he was pastor of a Presbyterian Church in Albany, N. Y. For three years he was occupied chiefly in study, particularly in the departments of science and philosophy. In 1852 he was called to the professorship of Psychology and cognate studies in the University of the City of New York. He taught, also, rhetoric and *belles-lettres*, and lectured quite largely on modern history, political economy, apologetics, natural theology, etc. In this congenial work Prof. Martin spent the remaining thirty-one years of his life. He received the degree of S. T. D. from Columbia College, New York, in 1862, and of L. H. D. from the Regents of the University of the State of New York in 1869. Dr. Martin was unsurpassed as a teacher, and exercised over the students under his care a very marked and beneficial influence for everything good and pure and true. He was ardent, clear-sighted, and comprehensive in all he undertook to do, and, while always careful to point out the errors and fallacies in much of our modern thinking in science and philosophy, he was entirely free from the littleness and narrow-mindedness of many who deem it necessary to depreciate and vilify science and its progress among men, as if there were danger of harm to true religion from the established conclusions of science. Dr. Martin contributed largely to the chief theological reviews, and wrote frequently for "The Independent" and "The Evangelist," particularly on national and anti-slavery topics during the civil war. He was a member of a number of societies for religious and social improvement, and one of his last lectures was delivered at the opening of the Institute of Christian Philosophy, in November, 1888. He leaves one son, occupied like his father in the important work of Christian training and culture of the young.

Mills, Clark, an American sculptor, born in Onondaga co., N. Y., Dec. 1, 1815; died in Washington, D. C., Jan. 12, 1888. He lost his

father when a child, and then lived with an uncle; but, becoming dissatisfied, he ran away from home in 1828. In his wanderings he reached New Orleans, and thence went to Charleston, S. C., where he learned the stucco or plasterer's trade, and worked at it for nine years. He began to model busts in 1845, and invented a new way of taking casts from the living face. He produced a marble bust of John C. Calhoun, which was purchased for the City Hall of Charleston, in 1846. Two years later he was in Washington city, where he furnished a design for an equestrian statue of Andrew Jackson, to be placed in Lafayette Square. There being no foundry or workman capable of producing this in metal, Mr. Mills was compelled to learn the business of casting, and after numerous trials succeeded in getting a perfect cast, in October, 1852. The statue was set up, Jan. 8, 1853, on the anniversary of the battle of New Orleans. It was completed at a loss of \$7,000; but Congress voted him an appropriation of \$20,000. At the same session \$50,000 was appropriated for a colossal equestrian statue of Washington, which was unveiled in the city of Washington, Feb. 22, 1860. Mr. Mills was next engaged in casting the colossal statue of Liberty, from a design by Crawford, which now crowns the dome of the Capitol. It was finished in 1863. At a later date his design for the monument to President Lincoln was adopted.

Milmore, Martin, an American sculptor, born in Sligo, Ireland, in 1846; died in Boston, Mass., July 21, 1888. He came to the United States in his sixth year, and received his education in Boston. Here he studied art, under Thomas Ball, and developed talent in this line. In 1868 he sent to the Sanitary Fair a statuette, entitled "Devotion," which was much admired. He opened a studio in Boston, and soon obtained success. He received the contract for the Soldiers' and Sailors' Monument on Boston Common, and went to Rome to carry forward and complete his studies in art. Mr. Milmore modeled busts of Pope Pius IX, Charles Sumner, Wendell Phillips, and many others. Among his public works are: the statue of America, at Fitchburg, monuments in various towns of Massachusetts, and statues of Gen. Thayer, at West Point, and of a "Weeping Lion," at Colby University. His last bust was of Daniel Webster, for the State-House at Concord, N. H. This is still in clay, but is to be put in marble by his brother.

Norton, William A., an American scholar, born in New York, in 1810; died in New Haven, Conn., Sept. 21, 1888. He was graduated at West Point, in 1831, and became lieutenant in the Fourth Artillery. He taught for some time at the academy as Professor of Natural and Experimental Philosophy. He joined the "Black Hawk Expedition," in 1832, but did not take active part in it. He resigned from the army, Sept. 30, 1833, and was afterward engaged in professorial work in the University of

the City of New York, Delaware College, Brown University, and the Sheffield Scientific School, Yale College. He remained in this last to the end of his life. He wrote several books on scientific subjects, was a contributor to periodicals, and was a member of the Academy of Science, etc.

Oakey, Emily S., an American author, born in Albany, N. Y., Oct. 8, 1829; died there, May 12, 1883. She received her education at the Albany Female Academy, and was graduated in 1850, with high honors. In 1854 she was offered a position as teacher in the academy, which she accepted and retained for twenty-five years. Miss Oakey was an admirable instructor in English composition, rhetoric, *belles-lettres*, and Latin. In later years she also taught logic, German, and French. Her health had never been vigorous, and the last year of her life she was in the hospital, a sufferer from malignant and painful disease. Miss Oakey displayed poetic ability of no mean order, and she contributed quite frequently to magazines and religious newspapers. Her poems have received high praise, and are noted for purity of sentiment and sweetness of versification. A volume of them was published just after her death.

Patterson, William C., an American financier, born in 1812; died in West Philadelphia, June 20, 1883. He was President of the Trust Company, and was well known in the financial world. He served in the Mexican War, and was for a time on the staff of his brother, Gen. Robert Patterson, during the first year of the civil war. He engaged in business in Philadelphia after the close of the great struggle, and was one of the original directors, as well as president, of the Pennsylvania Railroad.

Peck, Jesse T., an American clergyman, born in Middlefield, N. Y., April 4, 1811; died in Syracuse, May 17, 1883. While a student in Cazenovia College he was licensed as an exhorter, and in 1830 was licensed as a local Methodist preacher. In July, 1832, he joined the Oneida Conference at Manlius, and served as pastor for five years. He then gave himself to educational work, and became Principal of the Troy Conference Academy at Putney, Vt., in 1841. Here he remained seven years, when he was elected President of Dickinson College. During his four years of service the college prospered greatly. In 1852 he took to preaching again, his sphere of labor being the Methodist Church in Washington city. Two years later he became secretary and editor of the Tract Society in New York. Thence, in 1858, he went to California, where he remained eight years, actively and usefully occupied. Owing to the sickness of his wife he returned to the East, and was in charge of congregations in Peekskill, Albany, and Syracuse. He also entered zealously into the establishment of the University of Syracuse, N. Y. In 1873 he was elected one of the bishops in the Methodist Church. He was a preacher of consid-

erable eloquence and fervor, and wrote a number of books, the best known of which are, "The True Woman," "The Central Idea of Christianity," and "What must I do to be saved?"

Pinkney, William, an American clergyman, born in Annapolis, Md., April 17, 1810; died in Cockeysville, Md., July 4, 1883. He was graduated at St. John's College, Annapolis, in 1837, and was ordained deacon in the Episcopal Church in April, 1835, and a year later was ordained priest. His first charge was that of Somerset and Coventry parishes; he was next rector of St. Matthew's Church, Bladensburg; and then became rector of the Church of the Ascension, Washington city. In 1870 he was elected Assistant Bishop of Maryland, and was consecrated on the 6th of October. On the death of Bishop Whittingham, in 1879, Dr. Pinkney became bishop of the diocese. Owing to his advanced years, Bishop Pinkney was not so active and energetic as might have been desired; but he performed a large amount of work, and was universally respected and esteemed for his sincere devotion to duty and his many lovable qualities.

Randolph, Thomas F., formerly Governor of New Jersey, born in New Brunswick, N. J., June 24, 1836; died in Morristown, Nov. 7, 1883. His early education was obtained at the Rutgers Grammar-School, and for a time he was in the office of "The Fredonian," a paper owned and edited by his father on retiring from Congress. He next became a merchant, and went into business in Vicksburg, Miss. While there he married a granddaughter of Chief-Justice Marshall. In 1850 he returned to New Jersey, and took up his residence in Morristown. He was elected to the Assembly in 1859, and to the Senate in 1862, being also elected for the full term in 1868. Four years later he was made President of the Morris and Essex Railroad. In 1868 he was elected Governor of New Jersey. In 1874 he was chosen United States Senator, succeeding the Hon. J. P. Stockton. During the civil war he was warmly in sympathy with the Union cause. He was chairman of the special legislative committee on the "Peace Convention" in 1861. He lived mostly in retirement in Morristown after leaving Congress.

Rodney, George B., an American lawyer, born in 1802; died in Newcastle, Del., June 18, 1883. He was graduated at Princeton College in 1820, was admitted to the bar, and practiced in the courts for many years with success. He did not take much part in politics, and was in public life only a member of the House of Representatives. He was twice elected, and served from 1841 to 1845. He was a delegate to the "Peace Convention" of 1861. Mr. Rodney enjoyed the distinction, at the time of his death, of being the oldest lawyer of the Delaware bar.

Sands, Benjamin F., an American naval officer, born in Maryland, Feb. 11, 1812; died in Washington city, June 30, 1883. He entered the

navy as midshipman at the age of sixteen, and served in the Brazil squadron, the West India squadron, and the Coast Survey. He was commissioned as lieutenant in 1840, and was appointed to the frigate *Columbus* of the Mediterranean squadron. He did excellent service on the Coast Survey from 1850 to 1855, and was commissioned as commander in September, 1855. He was three years longer in this work, and was made captain in 1862. He took command of the steamer *Dakota*, of the North Atlantic blockading squadron, and participated in the engagement with Fort Caswell, Feb. 23, 1863. He was also present, in command of another steamer, at both attacks on Fort Fisher, 1864 and 1865. He was commissioned as commodore in July, 1866, and the year following was appointed Superintendent of the Naval Observatory. He was raised to the rank of rear-admiral in April, 1871, and put on the retired list in 1873.

Sands, Joshua E., an American naval officer, born in Brooklyn, N. Y., in 1795; died in Baltimore, Md., Oct. 2, 1888. His father was a personal friend of Washington's, and was Collector of the Port of New York. He entered the navy at the opening of the War of 1812, as midshipman, served under Commodore Chauncey on Lake Ontario, and was actively occupied all through the war. He was commissioned lieutenant in 1818, and served on various stations at home and abroad. He was made captain in 1840, and was on duty in the *Vixen* in the Mexican War. He was in command of the Government vessel which carried the articles for exhibition to the World's Fair, 1851, and received several tokens of honor. In 1856 he commanded the *Susquehanna*, and assisted in laying the first Atlantic cable. Three years later he was in charge of the squadron on the coast of Brazil. In 1862 he was made commodore, and took in hand the lake defenses. In 1866 he was raised to the rank of rear-admiral, and then placed on the retired list. He was port-admiral at Norfolk, Va., from 1869 till 1872. During the last ten years of his life he lived chiefly in Baltimore.

Sharswood, George, formerly Chief-Justice of Pennsylvania, born in Philadelphia, July 7, 1810; died there, May 28, 1888. He graduated from the University of Pennsylvania in 1828, and having studied law, he was admitted to the bar in 1831. He served in the Legislature of the State for three years, and in 1843 became editor of the "American Law Magazine." Mr. Sharswood gave character and standing to this quarterly; but, after three years' publication, the publishers discontinued it. He edited Stephens's "Nisi Prius" in 1844, and in the same year appeared his first edition of "Russell on Crimes," which passed through nine editions. In 1845 he was made Judge of the District Court. He was president judge from 1851 to 1867, when he was elected Associate Judge of the Supreme Court of Pennsylvania. He became Chief-Justice in January,

1879, and occupied the position until January, 1883, when his term expired. He was appointed Professor of Law in the University of Pennsylvania in 1850, and did excellent work in this position. He published "Professional Ethics" in 1856. The same year he brought out "Popular Lectures on Commercial Law," and in 1859 an annotated edition of "Blackstone's Commentaries." Several other valuable law books were edited by him.

Shelton, William, an American clergyman, born in Bridgeport, Conn., Sept. 11, 1798; died in the same house in which he was born, Oct. 11, 1888. His early training was in the home of his father, who was a clergyman of the Episcopal Church in its very earliest days in the United States, and his education was obtained at Cheshire Academy. Thence he went to the General Theological Seminary, where he was graduated in 1823, among the very earliest of its alumni. He was ordained deacon the same year, served the church at Plattsburg and Red Hook, N. Y., and joined his father as assistant in Fairfield (now Bridgeport), Conn. Here he was ordained priest in May, 1826. In September, 1829, he became rector of St. Paul's Church, Buffalo, N. Y., a post which he held to the day of his death. Buffalo, at the time Dr. Shelton went there, was a frontier town, so to speak, with less than 10,000 inhabitants; but he became identified with its growth and prosperity, took an active part in the duties of good citizens, and was honored and respected by all. He began the building of St. Paul's Cathedral Church in 1848 (which was not fully completed till 1868); was a delegate to the General Convention of the Church for nearly forty years; and gave much of his time to educational and missionary work.

Smith, Erasmus Darwin, an American jurist, born in De Ruyter, N. Y., Oct. 10, 1806; died in Rochester, N. Y., Nov. 11, 1888. While yet a youth, he went to Rochester, entered the law-office of Hon. E. Griffin, and was admitted to the bar in 1827. He was married in 1831 to a daughter of Mr. Griffin. After practicing law for several years, he entered into partnership with Mr. H. E. Rochester, which lasted for more than twenty years. For a number of years he was Clerk of the State Court of Chancery, and was a Democrat in politics. He joined the Whig party in 1855, and was elected a justice of the Supreme Court of the State in November of that year. In 1859 he was re-elected for a second term of four years. His position as Supreme Court judge made him also a member of the Court of Appeals for a part of both his terms. When the time for election came round again, Judge Smith was so acceptable to both parties that, in 1863, he was chosen for a third term. Meanwhile, the term of office had been lengthened to fourteen years, so that he continued on the bench till 1876, when, having become disqualified by age, he retired to private life. His eminently high character as a judge led to his being frequently

called on to act as referee during the latter years of his life. He was prominent in religious affairs, being an active and devoted member of the Episcopal Church, whose interests he loved to serve. He was also an ardent Mason.

Sojourner Truth, an American negro lecturer, born in the State of New York, about 1775; died in Battle Creek, Mich., Nov. 26, 1883. She was born a slave, and spent her life as a slave until 1827, when slavery was abolished in New York. Her parents came from the coast of Guinea, and were brought to the United States, and sold into slavery. The name she received from her master was Isabella Hardenburg, but, disliking it, she went out into the woods and prayed to the Lord for another name. According to her account, she heard the name "Sojourner" whispered to her in answer to her prayer, and the appellation "Truth" was afterward added, seeing that, in her going up and down throughout the country, as she held to be her mission, she should preach nothing but truth to all men. For about three quarters of a century she delivered lectures, in the East and West, on temperance, politics, and the woman's rights question. She could neither read nor write, but being very tall—nearly six feet—and having a deep, powerful voice, she proved to be a very imposing, effective lecturer. Among other things, she was anxious to obtain a grant of public lands in the West for the establishment of a negro colony, and for educating negro youth. There is no doubt that Sojourner Truth did much good work during her long life, for she helped to reclaim hundreds from bad ways, and set an example of great power to people of her own color.

Sophocles, Evangelinus A., an American scholar, born near Mount Pelion, Thessaly, Greece, March 8, 1807; died in Cambridge, Mass., Dec. 17, 1888. He was educated in the Convent of Mount Sinai. He came to the United States in 1829, studied for a while at an academy in Monson, Mass., and then entered Amherst College, but did not complete the course there. He taught for a time at Amherst, Hartford, and New Haven. He made two voyages to Greece, and returned each time with valuable works in his special line. From 1842 to 1859 he was connected with Harvard as tutor and assistant professor. In 1860 he was made Professor of Greek (Ancient, Modern, and Byzantine). In 1837 Yale College gave him the degree of A. M., and in 1868 Harvard conferred upon him the degree of LL. D. Prof. Sophocles published a number of Greek books of excellent quality. His "Greek Grammar" (first issued in 1838) had a very large sale, and is still in use. His latest and most elaborate work was "Greek Lexicon of Roman and Byzantine Periods," published in 1870.

Swann, Thomas, an American Senator, born in Alexandria, in 1806; died in Leesburg, Va., July 24, 1883. He was educated at Columbia College and the University of Virginia. His

law studies were pursued in his father's office, after completing which he removed to Baltimore. In 1845 he was elected a director of the Baltimore and Ohio Railroad. Two years later he became its president, and resigned in 1858. He next accepted the presidency of the Northwestern Virginia Railroad Company, and while in this office was, in 1856, elected Mayor of the city of Baltimore, and re-elected in 1858. While the secession struggle was in progress he was elected by the Union party Governor of the State of Maryland, and took his seat Jan. 1, 1865. The next year he was elected United States Senator, but was persuaded to remain at his post as Governor until the expiration of his term, Jan. 1, 1869. In November, 1868, Gov. Swann was elected by the Democrats as representative in Congress. He was re-elected four times, viz., in 1870, 1872, 1874, and 1876.

Talbot, Joseph, an American clergyman, born in Alexandria, Va., Sept. 5, 1816; died in Indianapolis, Ind., Jan. 16, 1883. He was of Quaker parentage, and received his educational training at the Alexandria Academy. About 1835 he removed to the West, where he engaged in mercantile pursuits and banking business. His religious convictions took such shape that he abandoned Quakerism, and united with the Episcopal Church. He was baptized in 1837, and after due preparation was admitted to the priesthood in 1848. He thereupon became rector of St. John's Church, Louisville, Ky., where he served some seven years. Thence he went to Indianapolis, and became rector of Christ Church in that city. In 1860 he was consecrated missionary Bishop of the Northwest, and five years later was chosen Assistant Bishop of Indiana. On the death of Bishop Upfold, in 1872, he became bishop of the diocese. He received his doctor's degree from the Western University of Pennsylvania, and subsequently, while in England at the Lambeth Conference, he was honored with the degree of LL. D. by the University of Cambridge. Bishop Talbot was possessed of vigorous manhood, was a man of fine appearance, and was an excellent preacher.

Taylor, Arthur F., an American chemist, born in Andover, Mass., in 1853; died suddenly while on a visit to New York, June 19, 1888. He was a graduate of Harvard College, and also of the School of Chemistry of the University of Göttingen, Germany. He was Professor of Chemistry for a time in the University of Pennsylvania, but in 1881 accepted the professorship of Chemistry in the Case School of Applied Science, Cleveland, Ohio. This post he held at the time of his death.

Thayer, Nathaniel, an American capitalist, born in 1808; died in Boston, Mass., March 7, 1883. He was a son of Rev. Dr. Thayer, of Lancaster, and for many years was a member of the firm of J. E. Thayer & Brother. He was largely connected with railroads and railroad development in the West, and was a director of the New

York Central, the Michigan Central, the Chicago, Burlington, and Quincy, and the Philadelphia, Wilmington, and Baltimore railroads. He was also a munificent benefactor of Harvard College, in buildings and endowments. He founded Thayer Hall (1870), the Thayer Commons Hall, etc., and bore the expenses of Agassiz's expedition to South America. Mr. Thayer was noted for generously contributing to the needs of poor students at Harvard.

Thorne, Charles E., an American actor, born in New York, June 11, 1840; died there, Feb. 10, 1888. His father was manager of traveling theatrical companies, and young Thorne spent his early years in this roving sort of life. His first appearance on the stage was in San Francisco, in 1852, when a mere boy. His father put him to learn a trade, but, as he did not like it, he went back to the theatre. After a while he met with some success, in 1862. He next went to China, and built a theatre in Shanghai, where he had fair success. Afterward he went to Egypt, and thence round the world by way of Paris and London. He came back to New York in 1878, and joined the Union Square Company.

Tom Thumb (Charles Heywood Stratton), an American dwarf, born in Bridgeport, Conn., Jan. 4, 1838; died in Middleborough, Mass., July 15, 1888. On entering the service of P. T. Barnum, in 1852, he received the *sobriquet* of Tom Thumb, by which he is best known. At that time he was not two feet high, and weighed less than 16 pounds. He was engaged at a salary of \$8 a week and traveling expenses; but, as he proved a great success at Barnum's Museum, his salary was increased to \$25 a week. In 1854, Barnum took him to England, where he was very successful, and was presented to the Queen and royal family. Thence he went to Paris, and saw more of royalty, reaping for his employer quite a golden harvest. The General's next experience was in getting a wife, viz., a dwarf girl named Lavinia Warren, to whom he was married in February, 1868. During the years subsequent to this, he and his little wife continued in the show business, traveled over the world, and held exhibitions wherever they went. His death was sudden, being the result of a stroke of apoplexy.

Trenchard, Stephen Decatur, an American naval officer, born in Brooklyn, N. Y., July 10, 1818; died in New York city, Nov. 15, 1888. His father was a naval officer under Com. Chauncey in the War of 1812. He was appointed cadet at the age of sixteen, and from 1835 to 1837 was stationed on the receiving-ship New York. He spent the year 1839 and part of 1840 in the Naval School in Philadelphia. He was promoted to passed-midshipman in July, 1840, and detailed for duty on the sloop Preble attached to the West India squadron. He was for two years in another vessel on the home squadron, and two more with the Coast Survey, after which he was promoted in February, 1847, to a lieutenancy. He was assigned to

the Albany, then to duty in the home squadron, the receiving-ship Philadelphia, the steam-frigate Powhatan, of the West India squadron, and the steamer Rhode Island: This last was a supply-vessel to the blockading squadron, from 1861 to 1865, under Lieut. Trenchard's command. He was commissioned commander in July, 1862, and distinguished himself in the attacks on Fort Fisher. After the civil war was over, he was stationed at the Brooklyn navy-yard, and thence was put in command of the Lancaster, flag-ship of the South Atlantic squadron. He was commissioned commodore in May, 1871; served on the Board of Examiners; and subsequently as light-house inspector. He was raised to the rank of rear-admiral in August, 1875. He was in command of the North Atlantic station from 1876 to 1878, and was placed on the retired list in July, 1880.

Uncle Tom (Josiah Henson), the hero of "Uncle Tom's Cabin," born in Charles co., Md., in 1789; died in Dresden, Ont., May 5, 1888. He was born a slave, and continued such until he succeeded in escaping into Canada with his wife and four children. Henson had been early taught religious truth and obligation, and so excellent was his character for sincerity and honesty that he was made a Methodist preacher before he knew how to read. In 1828 his Methodist friends contributed a large sum with which he expected to purchase his freedom; but he was tricked out of his money by his unscrupulous master. As soon as possible after that he ran away and got to Canada and freedom. He was active and industrious, and assisted largely in the "underground railway" mode of helping negroes out of slavery. He risked his life more than once by venturing into Kentucky. In 1851, after his eldest son had taught him to read, he visited England, and was treated with much kindness. On his return he wrote and published his autobiography, in order to raise means wherewith to buy the freedom of his elder brother. Mrs. Stowe's famous "Uncle Tom," in her novel, is based largely on the life and character of Henson. He visited England again, a few years ago, and had an interview with the Queen. It is said that 40,000 copies of his autobiography had been purchased by the people of the United Kingdom.

Van Buren, William E., an American surgeon, born in Philadelphia, April 5, 1819; died in New York city, March 25, 1888. His education was obtained in the city of his birth, with the exception of between two and three years passed at Yale College. He entered the medical class of the University of Pennsylvania, and finished his studies there before reaching the age required for graduation. Having this spare time, he went to Paris with Dr. Harlan, of Philadelphia, and was engaged in medical studies for eighteen months. On returning to the United States he was graduated in medicine from the University of Pennsylvania

in 1840. His graduation essay was of such superior merit that the Faculty took charge of its publication. Dr. Van Buren next entered the army, and served under Generals Wool and Harney in Florida, and for a short time on the Canadian frontier. In Florida his health broke down under malarial poisoning, the ill effects of which he felt all through life. In 1844 he was stationed in the Meteorological Bureau in Washington. The next year he went to New York, and became assistant to Dr. Valentine Mott in the department of surgery. He soon took high rank as hospital surgeon, as teacher of anatomy and surgery, and as a family practitioner. He was appointed one of the surgeons to the Bellevue Hospital at its organization in 1847, and in 1852 was made surgeon, and afterward consulting-surgeon, to the New York Hospital. Later he became surgeon and consulting-surgeon to St. Vincent's Hospital, and consulting-surgeon to the Woman's, the Charity, and the Presbyterian Hospitals. He was elected Professor of the Art of Surgery in Bellevue Hospital Medical College in 1868, where he lectured up to within a few months of his death. He was also Vice-President of the New York Academy of Medicine, President of the Pathological Society, and corresponding member of the Paris Société de Chirurgie. Dr. Van Buren translated and annotated several valuable works in his chosen department of medical science, and published in later life lectures on "Diseases of the Rectum," and a text-book on "Genito-Urinary Surgery." His reputation as a teacher was very great, and his skill and judgment in surgical cases ranked high. Dr. Van Buren married a daughter of Dr. Valentine Mott in 1842. His wife and two married daughters survive him.

Washburn, Israel, an American legislator, born in Livermore, Maine, June 6, 1813; died in Philadelphia, May 12, 1883. His early education was obtained at the public school, but after his fourteenth year he was in charge of private tutors at home. He studied law, was admitted to the bar in 1834, and practiced with fair success in Orono, Maine. During the years 1842-'50 he served in the State Legislature, and in 1850 was elected to Congress as a Whig. He was re-elected in 1852, 1854, 1856, and 1858. He served in Congress continuously from Dec. 1, 1851, to Jan. 1, 1861, when he resigned, having been elected the year previous Governor of Maine. He was re-elected in 1861, but declined a third term. Subsequently he was appointed Collector of Customs at Portland, Maine. He published in 1874 "Notes Historical, etc., of Livermore, Maine."

OBITUARIES, FOREIGN. **Barca, Francisco**, Spanish minister to the United States; died by his own hand in New York, July 29, 1868, while under depression of spirits produced by insomnia. He was born at Puerto Real, near Cadiz, in 1831. After studying law at Madrid, he was at the age of twenty-three given a place in the Department of the Interior. He lost

the office upon the defeat of the O'Donnell Cabinet, but resumed it after the accession of the Union Liberals in 1858. He was elected a deputy for the district of Puerto de Santa Maria in 1858, and held that seat for seven or eight terms, taking a high rank as a parliamentary orator. In 1868 he was associated with Herrera as Director-General of the Administration. During the Revolution of 1868 he advocated the candidature of the Duc de Montpensier for the throne. After the choice of Amadeus he worked for the restoration of the royal family in the person of Don Alfonso. When the latter was proclaimed King, Señor Barca took the office of Sub-Secretary of the Interior, which he resigned after a year and a half, on account of his sympathies with the Liberal Opposition. He declined several high offices before accepting, in 1881, the post at Washington. Señor Barca was an advanced Liberal. He published a "Dictionary of Politics and Administration," and other works.

Barrot, Ferdinand, a French politician, died Nov. 13, 1888. He was born in 1806, defended Louis Napoleon's accomplices in the attempts at Strasburg and Boulogne, was Minister of the Interior in 1849, and a Senator under the empire. He was elected Life Senator as a Bonapartist in 1877.

Becaresse, Basile, a Roumanian statesman, died in Paris, Dec. 7, 1888. He was born in 1830, the son of a poor peasant. He studied in Paris, and returned to Bucharest with the degree of doctor of laws in 1851. He soon acquired a reputation as a practicing lawyer, but occupied himself also with politics, and, as a member of the commission appointed in 1858 to consider the question of uniting Moldavia with Wallachia, advocated the union with success. He was then appointed Minister of Justice by Prince Cuza, and two years later Minister of the Exterior. He opposed the Cogelniceano ministry, and after the fall of Cuza was called into Prince Charles's Liberal Cabinet as Minister of the Exterior in 1868. He worked energetically to obtain the sanction of Europe to Roumanian independence. When the Danube question came up, he was driven from office under suspicion of having entered into secret engagements with Austria.

Bonacchese, Cardinal de, Archbishop of Rouen, died Oct. 28, 1888. He was born May 30, 1800, of Protestant parents, and was a magistrate before he joined the priesthood in 1830. He became a cardinal in 1863, and defended in the Senate the temporal power of the Pope. He was distinguished as an orator. In his charges of recent years he condemned the ecclesiastical policy of the republic, but in moderate language.

Burke, Thomas M., an Irish clergyman, born in Galway, Ireland, Sept. 8, 1830; died in Dublin, July 2, 1888. He went to Perugia, Italy, in 1847, and became a Dominican. Thence he went to Rome, and studied there for five years. He returned to Ireland as a priest, and estab-

lished a novitiate for the order of St. Dominic. Here he became famous for eloquence and skill as a public speaker. Father Burke went to Rome again, and was made Superior of St. Clement's. He remained in Rome till 1854, when he made his way back again to Dublin. In 1871 he visited the United States in the capacity of Visitor-General of the Dominican Order. He delivered lectures almost daily, with great power and effect. In November, 1873, he lectured in New York, on J. A. Froude's views of the relations between England and Ireland, which resulted in an animated controversy. Father Burke also published "Lectures and Sermons" in 1873.

Bursian, Conrad, a German philologist, died in Munich in September, 1883, at the age of 52. He was born in Saxony, and studied at Leipzig under Haupt and O. Jahns. After graduation he made a classical tour in Southern Europe, became extraordinary professor at Leipzig, was ordinary professor at Tübingen at the age of thirty-one, was professor at Jena and Zurich, and from 1874 at Munich. Besides an exhaustive geography of Greece and numerous editions of classical works, he published an annual review of the progress of the science of classical antiquity, and recently completed a "History of Philology."

Carl, Prince, of Prussia, the last surviving brother of the German Emperor, died in Berlin, Jan. 21, 1883. He was born in 1801, and married a sister of the present Empress, a Princess of Saxe-Weimar. He passed through the grades of military promotion to the rank of field-marshal, and as chief of artillery introduced improved ordnance; yet unlike his son, Prince Friedrich Carl, he never conducted any military operations.

Castellani, Alessandro, an Italian antiquary, died June 8, 1888. His father was a picture-dealer and jeweler, the reviver of the granulated goldsmith's work of the Etruscans and the classical styles of jewelry, which have been further developed by his other son Agostino, and by Giuliano, in London. Alessandro was an ardent republican. In consequence of the Revolution of 1848, he was confined in the castle of St. Angelo, from which he escaped by feigning insanity. He settled at Naples as a collector and dealer in antiquities. His knowledge, taste, and business tact enabled him to lay hands on all the finest discoveries of Etruria and Southern Italy, and to dispose of them at profitable prices to the European museums. Two large collections were bought by the British Museum. A third, composed of gems, gold ornaments, and bronzes, was offered at the Centennial Exhibition to any American museum; but, as the price was not obtained, it was disposed of in Europe.

Charles II, Duke of Parma, died in Nice. He was born in 1799, and succeeded his mother in the duchy of Lucca in 1824. This land was ceded to Tuscany in 1847. In that year he succeeded Marie Louise, widow of Napoleon,

in the duchy of Parma. By the Revolution of 1848 he was driven out, and in Saxony signed an abdication in favor of his son, who died in 1854. The son of the latter was dispossessed in 1859. Duke Charles married in 1820 the daughter of Victor Emanuel I of Sardinia. In later life he resided at Nice, under the title of Count of Villafranca.

Célenger, Jean Baptiste Auguste, a French sculptor, died in Paris, Jan. 6, 1868. He was born at Besançon in 1814, and studied sculpture under his father and then in Italy. He gained his first reputation with a bust of Scribe, and executed several others. In 1848 he exhibited a faun and a statue of "Melancholy," and in 1847 four pieces, one of which, a statue of a girl bitten by a serpent, was greatly admired. In 1848 he presented the Provisional Government with a colossal bust of "Liberty," and executed a statue of "Fraternity," statues of Rachel as "Phœdra" and "Lesbia," statues of "Tragedy," "Sappho," "Cornelia and her Children" (1861), "Cleopatra" (1869), equestrian statues of Francis I (1856) and the present Austrian Emperor (1873); and portraits of George Sand, whose daughter he married, Gen. Cisse, and others were among his numerous works. He followed Canova in using color and picturesque effects, but carried this classical revival to the extreme of effeminacy.

Collier, John Payne, an English Shakspearean critic, died Sept. 18, 1883. He was born in 1789. His father, John Collier, was a writer and publisher. The son, after studying law, became a parliamentary reporter and a writer of essays and reviews. As editor of the "Evening Chronicle," he began to write about Elizabethan literature, and he soon after devoted himself more completely to literature, and was the most efficient seconder of the efforts of Lamb and Hazlitt to revive an interest in the minor poets of Shakspeare's time. He published "The Poetical Decameron," brought out a new edition of Doddsley's "Old Plays," prepared a "Bibliographical and Critical Catalogue," and, with the facilities of the libraries of Lord Egerton and the Duke of Devonshire at his command, published "New Facts regarding the Life of Shakspeare." He published Shakspeare's plays, and wrote a "Life of Shakspeare," and many other works. A discovery of a folio of Shakspeare with marginal notes gave rise to a controversy in 1859-'60, and imputations against his literary honesty.

Conscience, Hendrik, a Flemish novelist, died Sept. 10, 1883. He was born Dec. 3, 1812, at Antwerp, where his father, a Frenchman from Besançon, was settled as a merchant. He enlisted in the Belgian army in 1830, at the time of the Revolution, and, during his four years' service, wrote numerous martial and patriotic songs in the manner of Béranger, most of them in Flemish. When he was discharged, in 1836, his father gave him the choice of pursuing a mercantile career and giving up writing, or of shifting for himself. He

found employment as a gardener, then as a village schoolmaster, then as a clerk, writing at the same time romantic tales taken from Flemish history. In 1838 the Anti-French League was started, which aimed to make the Flemish the national language. Conscience's national stories were circulated broadcast. He then changed his subject and manner, and depicted the ordinary life of the people in a style of child-like simplicity. "Evening Hours," "The Executioner's Child," "Rikketikketak," and "The Conscript," are among the best realistic novels that are written in any language. Appointed by the King teacher of Flemish to his children, and receiving a sinecure in the public service, he continued writing, but the freshness and vigor of his first stories were wanting until the loss of his appointment through a change of ministry stimulated his faculties, when he produced "The Martyrdom of a Mother," "The Child-Stealer," and "The Blue House." He was one of the most prolific of modern authors; the number of his novels was over eighty. Though they are inspired by a political idea, the artistic merit, particularly of his novels of popular life, is of the highest order. Conscience was passionately devoted to the national movement, of which he was the apostle, and was the idol of the people.

Deschamps, Cardinal, Archbishop of Mechlin, died Sept 30, 1838. He was born in 1810, was a journalist in early life, and took an active part in the movement for Belgian independence. He began the study of theology in 1831, and, after graduating at Louvain, joined the Redemptorists. He became distinguished as a preacher, was head of a monastery, in 1865 was consecrated Bishop of Namur, and in 1867 Archbishop of Mechlin. He took a leading part in the Ecumenical Council, and in the election of Pope Leo X.

Dindorf, Wilhelm, a German philologist, died in Leipzig, August 7, 1838, at the age of 81. He resigned a professorship in Leipzig University and devoted himself, when about thirty years of age, to critical study of the Greek classics. He published critical editions of Aristophanes, Demosthenes, and other Greek writers, "Scholia" on Homer, and many other works relating to the literature of ancient Greece. Unsuccessful financial speculations forced him to sell his library in 1879, and preyed on his mind to such an extent as to incapacitate him for his literary studies.

Doyle, Richard, an English caricaturist, died in London in December, 1838. He was the son of John Doyle, a caricaturist, and was born in London in 1826. His sketches of character in "Punch" contributed greatly to the success of that journal, which he left in 1850 on account of its attacks on Cardinal Wiseman and the Catholics. The title-page of "Punch" which he designed is still in use. He illustrated many books of humor and fancy, notably "The Continental Tour of Brown, Jones, and Robinson" (1854), "The New-

comea," "The Fairy Ring," Leigh Hunt's "Jar of Honey," and "In Fairyland." He exhibited many water-color drawings.

Erk, Ludwig, a German composer, died Nov. 30, 1838. He was born Jan. 6, 1807, at Wetzlar, where his father was organist. He lived in Berlin. As a composer of glees and part-songs, and of music for schools, he was unexcelled.

Flotow, Friedrich von, a German musical composer, died in Darmstadt, Jan. 24, 1838. He was born in 1812, on the estate of his family in Mecklenburg-Schwerin. He devoted himself early to music, studying in Paris under Reicha, a famous theoretician. The first of his works that was produced on the stage was the "Shipwreck of the Medusa," which obtained a season's success in Paris in 1839-'40. In 1844 he produced the opera "Alessandro Stradella," which became a popular favorite, at first in Germany and then in other countries. In 1847 appeared at Vienna the still more popular "Martha." None of Flotow's compositions except these two operas contained the elements of permanent success, though refinement and exhilarating gayety characterize all his music.

Gravez, Théodore, Bishop of Namur, died July 18, 1838. He was born at Sivry, in Hainault, in 1810. He succeeded Monsignor Deschamps as Bishop of Namur, Dec. 20, 1867. He was the most ardent of the Syllabists, and kept up the conflict against the new ecclesiastical laws after Pope Leo had instructed the clergy to respect the Belgian Constitution, particularly by an anti-constitutional catechism recently published.

Gungl, Josef, a Hungarian musician, died Nov. 25, 1838, at Zsambeck, where he was born, Dec. 1, 1810. First distinguishing himself as a player on the oboe, he became a band-master, and attained a world-wide celebrity as a composer of dance-music, rivaling the compositions of Strauss. He led an orchestra in Berlin, with which he made a tour in the United States, removed to Brunn in 1858, thence to Munich in 1864, and finally to Frankfurt in 1876.

Halévy, Léon, a French author, died in September, 1838. He was born in Paris, Jan. 14, 1802. Unable to follow the profession of his choice, that of a teacher, on account of being a Hebrew, he applied himself to literature, and obtained in 1837 a post under the Government as archivist. In his youth he published elegiac poems, in 1827 a "Résumé of the History of the Jews," in the same year imitations of the principal foreign poets, in 1834 the poetical drama of "Luther," in 1838 a "History of French Literature," in 1848 and in 1853 collections of fables, which were crowned by the Academy, followed by "Greek Tragedy," a collection of translations from the Greek dramatists, which was also crowned. Among his numerous dramatic compositions are "The Duel," "The Ozar Demetrius," "L'Espion,"

"Le Dilettante d'Avignon," "Beaumarchais à Madrid," "Indiana," and "Le Chevreuil." He wrote also a life of his brother, the composer.

Iwakura, Tomomi, a Japanese statesman, died in Yeddo, July 20, 1883. Till within a short time of his death, he held the post of Third President of the Council, which he resigned on account of ill health. He was a member of the Kuge, or noble class, which had suffered in political power and territorial position in common with the Mikado. He was educated at Kioto, and attached himself at an early age to the person and fortunes of the Mikado, who at that time was kept in confinement and made to endure all kinds of privations. Iwakura, with the Prime Minister, Sanjo Sanerjoshi, finally organized the party of the Mikado. In 1871 he went to the capital of Satsuma as special envoy to obtain the assistance of that prince. In August of the same year he was constituted Vice Prime Minister, the office which he held till his retirement. He opposed the schemes of aggrandizement in Corea and Formosa, which attracted the younger school of politicians, and was accounted the chief of the peace party. He was placed at the head of the mission sent to Europe for the purpose of revising the treaties with foreign powers, but returned without accomplishing his object.

Jessel, Sir George, an English judge, Master of the Rolls, died in London, March 22, 1888. He was the son of a Jewish merchant, and was born in London in 1824, was graduated at University College in that city in 1844, and was called to the bar in 1847. He was elected to Parliament for Dover in 1868, and appointed Solicitor-General in 1871, and Master of the Rolls in 1878. He was the first Jew that ever sat on the English bench, and received high credit for his labors in working out the harmonious combination of equity jurisdiction with that of common law.

Jung, Sir Salar, a Hindoo statesman, died of cholera, at Hyderabad, Feb. 8, 1888, at the age of 54. He was the descendant of a family which had furnished the Nizam of the Deccan, or Hyderabad, with his Dewan, or Prime Minister, since the founding of the dynasty in the beginning of the eighteenth century. He filled official employments from his youth, and in 1858 succeeded his uncle, Suraj-ul-Mulk, as Prime Minister. He addressed himself to the reform of the abuses which led to the intervention of the English and the annexation of the Berar province. The country was a prey to a turbulent nobility who plundered the rural districts, and a lawless Arab soldiery who terrorized the capital. Lord Dalhousie meditated the extension of British rule over the Deccan, and such would have been the ultimate fate of the Nizam's kingdom if the Mutiny had not taxed the energies of the British to preserve the possessions already acquired. When the rebellion was suppressed, Salar Jung had succeeded in reforming the state. He gradually reduced the Arab mercenaries to

discipline, and employed them to establish civil order and subjugate the quarrelsome and free-booting military chiefs. Trade and agriculture revived, while the Dewan purged the court of vices and corruption, and established an orderly civil administration on the British model. His work was indifferently appreciated by the Nizam Afzul-ud-Dowlah, who subjected him to petty restrictions and suspicious surveillance. On the death of that sovereign, he was, in 1869, through pressure exerted by the Indian Government, appointed Regent, jointly with the late Amir-i-Kabir, during the minority of the infant prince. His administrative reforms were not suffered to relapse, but were kept energetically in operation to the day of his death, so that Hyderabad was as well governed as any of the British provinces. Salar Jung cherished the hope that the English would restore Berar to the Nizam, in which vain expectation he visited England in 1876.

Laboulaye, Edouard René Lefèvre, a French jurist, died in Paris, May 25, 1888. He was born in Paris, Jan. 18, 1811. In his 28th year he won a wide reputation as a scholar by publishing a work on the "History of Landed Property in Europe." He announced his trade, that of a type-founder, on the title-page. Three years later he obtained admission to the bar. A second work, on the "Life and Doctrines of Savigny," which first familiarized the French with the teachings of the historical school, was published about this time. This was followed by elaborate treatises on "The Civil and Political Condition of Women from the Time of the Romans" (1843), and "Roman Criminal Legislation respecting the Responsibilities of Magistrates" (1844). In 1849 he was chosen Professor of Comparative Legislation in the College of France. He was an ardent republican, and in consequence of his opinions the Imperial Government found means to prevent his election to the Corps Législatif. He was a careful observer of the politics of the United States, and an admirer of the American Constitution. In 1855 he published the first part of a "Political History of the United States," which was completed in 1866. He translated into French the works of William Ellery Channing. He wrote also "Studies on Germany and the Slavonian Countries," and "Religious Liberty," besides minor works. During the American civil war he was a zealous advocate of the cause of the Union, writing with this object, "The United States and France." His most popular work is "Paris in America" (1868), a political allegory. A "Programme of the Liberal Party" was published in 1865, and the "Memoirs of Franklin" in 1866-'67. In the beginning of 1870 he was appointed a member of a commission to inquire into the administration of the Seine department. He ceased his opposition to the empire in the face of foreign trouble, declaring his belief in the necessity of a "peaceful revolution," and advocated an affirmative vote in the *plébiscite* of May, express-

ing his belief in the reforms promised by Napoleon and Émile Ollivier. For this he was hissed by the students in the university and compelled to suspend his lectures. In July, 1871, he was elected to the National Assembly for the department of the Seine. As secretary of the committee of thirty on the Constitution, he combated the monarchists effectually. He took a prominent part in the debates, voting with the Left Center, in support of Thiers, and in favor of the existing press and education laws. In 1875 he was elected a life Senator. In 1876 he was appointed Administrator of the College of France. In 1877 he resumed his lectures on comparative legislation. He was an earnest advocate of absolute freedom of education, and, in social questions, believed in the principle of co-operation and approved of the establishment of libraries and similar institutions for the working class. Laboulaye was a republican of the old school, whose ideal was presented in De Tocqueville's description of the republican ideas of the modern generation of Frenchmen. His later life was embittered by the antagonism with the Liberals in which he was placed by the educational and anticlerical legislation which he opposed in the Senate.

Lasteyrie, Jules, Marquis de, a French politician, died in Paris, Nov. 15, 1888. He was born Oct. 31, 1810, and was a grandson of Lafayette. He was an officer in the army of Dom Pedro. In 1842 he entered the French Chamber. He was expelled in 1852 for protesting against the *coup d'état*, but was amnestied. He was elected as an opposition candidate in 1869, and sat in the National Assembly of 1871, voting with the Right Center, but afterward joining the Left Center and voting for all the new constitutional laws. He was elected Senator for life, Dec. 10, 1875. He wrote a "History of Political Liberty in France."

Lenormant, François, a French archaeologist, died in Paris, Dec. 9, 1888, from a malarial affection contracted during explorations in Calabria. He was born Jan. 17, 1837. He was gifted with an extraordinary memory, and under the tuition of his father, the distinguished archaeologist, Charles Lenormant, he early developed skill in research. He published a learned essay when only fourteen years old, and at the age of twenty won the numismatic prize of the Academy of Inscriptions. During his archaeological tours he was a witness of the massacres of the Druses in Syria, in 1860, of which he wrote a graphic account. He made important excavations at Eleusis in the same year. In 1874 he was appointed Professor of Archaeology in the National Library. He served as a volunteer in the siege of Paris, and was wounded at Buzenval. He was a profound and original writer on the archaeology of the Bible, was a high authority in numismatics, and wrote with great historical grasp and economical insight of the monetary systems of the ancients. He was especially great as an

Assyriologist and investigator in the history of all the ancient Oriental empires, and wrote numerous monographs on cuneiform syllabaries, etc., and general treatises on the ancient history of the East.

Lopez, Antonio, Marquis of Comillas, a Spanish financier, died in Barcelona, Jan. 17, 1888. He was born in 1820, in the village of Comillas, from which he took his title when raised to the hereditary nobility by the King, who visited his castle in 1881. Lopez was born poor, but succeeded early in business, laying the foundation of his fortune, which was estimated at the time of his death at \$25,000,000, in Cuba. He was the founder of the great Spanish line of transatlantic steamers, and was engaged in the Philippine Tobacco Company and other large commercial undertakings.

Mahmoud Nedim Pasha, Grand Vizier of Turkey in the reign of Abdul-Aziz, died in Constantinople, May 17, 1888. Under his vizierate the Sultan was encouraged to ignore the Porte. After the decree of insolvency he was virtually exiled. He was recalled in 1879, and made Minister of the Interior.

Majlath von Sankhely, Georg von, President of the Hungarian Upper House and Chief-Justice of Hungary, was murdered by his servant and an accomplice, March 29, 1888. He was born in 1818, and was appointed to the Diet in 1839 and in 1843. He subsequently filled the office of Hungarian Chancellor at Vienna until 1869, in which year he was made President of the Upper House in Pesth.

Manet, Edouard, a French painter, died April 30, 1888, aged 50. He studied under Thomas Couture. In 1868 he offered to the Salon a painting in a new manner, which made a sensation in the exhibition of rejected pieces. He spent his life and his fortune in seeking recognition for his "impressionist" idea of reproducing tones of light, or solving the problem of the transparency of shades.

Marme, Ernst, an Austrian traveler, died at Fazogl, Africa, Aug. 17, 1888. He was born in Vienna in 1844, and devoted himself to the study of zoölogy. He visited Abyssinia when 21 years of age, and after remaining in Vienna for two years, returned to Africa, where he spent most of his remaining years. He traveled by way of Sennaar and Fazogl to Fadasi, which had never before been visited by a European, was the first to explore Giraffe river, went to Gondokoro in 1872, accompanied Col. Long on an excursion to Mundo and Makraka in 1874, took service under the Belgian International Association in 1876, and led a party to Kvakiara from Zanzibar, but returned, and, going back to the Soudan, was made Vice-Governor of Galabat by Gen. Gordon. Reouf Pasha sent him to Fashoda to check the slave-trade in 1880.

Martín, Henri, a French historian, died Dec. 14, 1888. He was born in St. Quentin, Picardy, Feb. 20, 1810. He early conceived the idea of writing the history of France in a

patriotic manner, and his patriotism soon took on an ethnological character. The French he conceived to have inherited from the Druidical Celts qualities making them superior to other races, and his "History of France" was composed in this spirit. The conscientious earnestness of his political convictions, and his blameless and dignified character, won a degree of respect from the people of Paris that was paid to few of his contemporaries. He attempted to rescue the republican constitution at the time of Napoleon's *coup d'état*, but under the empire he was not molested. He was chosen Senator on the establishment of the third republic. His historical writings are numerous.

Marx, Karl, a German socialist, died in London, March 15, 1883. He was born at Trier, May 2, 1818. His father was a lawyer. He studied law and philosophy at Bonn and Berlin, and was about to become a tutor at Bonn, when a chance acquaintance led him to enter the office of the radical "Rhenish Gazette," the direction of which he assumed in 1842. A year later the paper was suppressed. Marx went first to Paris to study the French political economists, and directed his attention at the same time to Hegel's philosophy of jurisprudence, on which he published a critique in 1844 in the "Franco-German Year-Book," edited by him and Arnold Ruge. Expelled from France, he settled at Brussels, where he published, in 1847, the first of his writings on economical questions, a polemic entitled "Misère de la philosophie," in answer to Proudhon's "Philosophie de la misère." In the same year, in conjunction with his Rhenish countryman, Friedrich Engels, who had studied for years the economical conditions of England, he set on foot the first and most famous of socialist congresses in London, at which the "Manifesto of the Communist Party" was published. For this he was expelled from Belgium, and at the outbreak of the revolution returned to Cologne, where he edited—in association with Engels, Freiligrath, Hermann Becker, Albert Wolff, later of the "Figaro," who furnished *feuilletons*, Ferdinand Lassalle, and others—the "New Rhenish Gazette." His acquaintance with Lassalle bore important fruits in the Social-Democratic movement in Germany, and the present social projects of the German Government. The journal called upon the people to refuse to pay taxes after the counter-revolution, and for this it was suppressed. Marx then fled to England, and devoted himself to the study of the conditions of labor in the line of research initiated by Engels. The effect of Marx's contributions to the science of political economy was marred by his revolutionary schemes to carry his theories into practice. In 1864 a socialist meeting was held in St. James's Hall, in London, at which socialism was declared to be communistic and international. A committee was appointed to draw up a plan of organization. In the committee Marx was the principal person. He drew up

the statutes which were adopted at the Socialist Congress at Geneva in 1866 as those of the International Society, of which Marx remained, under the title of secretary, the head and acknowledged leader until 1872. A defection of the English members resulted in the victory of the Federalists, who advocated the organization of the labor movement on national lines. Marx consequently ceased his agitation. His principal work was "Capital" (1867), preceded by a "Critique on Political Economy" (1859). A second part of his great work, dealing with the distribution of wealth, while the first treated of production, was left in manuscript. Marx assailed the English school of political economy with great dialectical power, but in a polemical tone, which concealed the extent to which he assimilated the ideas of Adam Smith and the older writers. His wife was a sister of Minister von Westphalen, of the Prussian reactionary Cabinet headed by Manteuffel.

Moffat, Robert, a Scottish missionary, died August 10, 1888. He was born at Inverkeithing in 1795, and was a gardener, but was sent to South Africa in 1816 by the London Missionary Society. Soon after obtaining the reluctant permission of the Governor to undertake his Christianizing labors, he made a convert of Africaner, chief of the Namaquas, the scourge of the border. Proceeding farther, he took up his abode among the Bechnas. This nation he slowly educated in religion and civilized arts. Visiting England in 1842, he persuaded Livingstone, who afterward married his daughter, Mary Moffat, to return with him and share his work. Moffat continued his labors at Kuruman, and extended his teachings among the distant Matabele and Makololo until his final return in 1870. He was occupied a large part of his life with the difficult task of translating the New Testament into the Bechuana language.

Mtesa, Emperor of Uganda, died in the summer of 1888. He was a despot, who consolidated a powerful kingdom around Lakes Victoria and Albert. He received the emissaries of the Kbedive and the Christian missionaries, Catholic and Protestant, with deceptive complacency, and held out hopes of his conversion to Islam or to Christianity. Although a monster of cruelty, he impressed European visitors, especially Henry M. Stanley, with his intelligence and courtesy. He was particularly covetous of arms and gunpowder, and obtained many presents from travelers. His principal subjects sought to have their daughters taken into the royal harem, which numbered 7,000 women. Mtesa was possessed with the delusion that he was the greatest monarch in the world, and was ambitious to extend his power. Over his subjects he exercised a boundless tyranny. He was sprung from the Wahuna chiefs who obtained possession of the country at an early date. He was not, however, of pure race, but had a considerable admixture of negro

blood. He traced his lineage through thirty or forty rulers to Kiutu, the founder of the dynasty. He was tall, slim, and graceful, with an intelligent face. He died of a consumptive malady. His age was under fifty.

Nilsson, Swen, a Swedish naturalist, died Dec. 3, 1888. He was born at Landskrona, March 8, 1787. He was graduated at the University of Lund in 1811, took charge of the natural history museum, and in 1821 was appointed professor. His great work on the "Scandinavian Fauna" was begun in 1820 and completed in 1853.

Obeidullah, Sheik, died in Mecca in the autumn of 1888. He was descended from the daughter of the Prophet, and was esteemed one of the three holiest personages in Islam. He was chief of the warlike Kurds who dwell on the confines of Persia and Turkey, over whom the Porte and the Shah both claimed the sovereignty. Obeidullah aimed to achieve the independence of his tribe, and to wrest a sufficient territory from Turkey or Persia. The authorities at Stamboul are said to have incited him to the invasion of Persia, even furnishing Martini-Henry rifles to the Kurds. In April, 1881, a small army of Kurdish horsemen raided the region around Lake Urumiyah, destroying the Persian towns, under the lead of a son of the sheik and a chief named Hamya Aga. The Persian general, Mirya Khan, finally defeated them in a pitched battle. When Obeidullah was advancing with his main army to support his son, he learned that a large Turkish force was marching upon him in the rear, and fled to the mountains. An emissary of the Porte, by promises of honors and distinction, lured him to Stamboul, where he was placed in confinement. During the fast of the Ramazan he made his escape, and, rallying his followers, attempted another raid, encouraged, it was rumored, by the Russians. He was captured by the Turks in October, 1882, but was rescued by Kurds from the convoy which was taking him to Mosul. He was besieged in the mountain stronghold of Kouruma and defeated. Disappointed in his ambition and broken in health, he spent his last days in religious exercises. He was visiting the Kaaba at Mecca when, like many other pilgrims, he fell a victim to the cholera. He was a man of striking appearance, a Bedouin of the purest blood, between fifty and sixty years of age, below the medium stature, with deep-sunk, gleaming eyes, under arched eyebrows, and a long, slightly aquiline nose.

Overstone, Baron, Samuel Jones Loyd, an English financier, died in London, Nov. 17, 1888. He was born Sept. 25, 1796. His father, Rev. Lewis Loyd, had abandoned the Church to engage in business with his father-in-law, and had built up the banking-house of Jones, Loyd & Co., which was merged subsequently in the London and Westminster Bank. He was educated at Eton and Cambridge, sat in Parliament from 1819 to 1826, succeeded his father in the banking-house in 1844, and was raised

to the peerage in 1850. He was the chief authority in England on banking, and had great influence in shaping financial legislation, and especially in establishing the English monetary system on a sound basis and giving the Bank of England a safe and conservative constitution. He was chairman of the Irish Famine Committee in 1847, and an influential promoter of the Great Exhibition of 1851.

Pierre, Pierre Joseph Gustave, commander of the French squadron which bombarded the ports of Madagascar, died early in September, 1868, on board the Caledonia, before landing on his return voyage, while in quarantine at Marseilles. He was one of the ablest officers in the French navy; but his acts in Madagascar gave offense to the English, which led to his recall. He was born Feb. 28, 1827, at Dijon, entered the naval school in 1841, distinguished himself at Mogadore and Tangiers, and was promoted to be ensign in 1846, and lieutenant in 1858, serving from 1856 to 1858 in hydrographical labors. He was made a Chevalier of the Legion of Honor in 1857. From 1861 to 1865 he was aide-de-camp to Admiral La Roncière. He was promoted captain in 1865, and commanded the *Néréide* in Oceania in 1869-'70. On his return he took part in the national defense, and was present at the battle of Orleans. He was director of evolutions at Cherbourg in 1872, member of the hydrographical committee, and commander of the *Infernet* in New Caledonia, and was promoted to rear-admiral in 1880. He aided in the revision of the cadre, and was a member of the Admiralty Council until he took command of the Division of the Indian Ocean, Feb. 1, 1888.

Reld, Mayne, an English writer of fiction, died Oct. 22, 1868, at his residence near London, aged sixty-five. He was a native of the north of Ireland, and was educated for the Church, but following an adventurous bent he started for Mexico in 1838, lived for five years by trading and hunting in the far West, traveled through the United States, took a commission in the American army on the outbreak of the Mexican War, and distinguished himself at Vera Cruz and Cherebusco. He raised a company in New York to aid the Hungarian revolutionists in 1849; but, learning of the failure of the insurrection when he reached Paris, he settled in London and devoted himself to writing romances in which the fruits of his observations of nature and strange customs in many lands were set off with thrilling plots and incidents. His books have an irresistible fascination for boys. The most popular are the "Rifle Rangers" and the "Scalp-Hunters."

Rhalls, George, a Greek statesman, died in September, 1868, at the age of eighty. In the early period of the Hellenic kingdom he filled the post of Minister of Justice, and then became President of the Supreme Court and Court of Cassation, and Professor of Commercial Law in the University.

Rivière, Henri, a French naval officer, chief of the expedition to Tonquin, killed in the fight at Hanoi, May 19, 1838. He was born in Paris, in 1827. He entered the naval academy in 1843, became midshipman in 1845, ensign in 1849, lieutenant Nov. 29, 1849, and captain of a frigate June 1, 1870. He was instrumental in suppressing the insurrection of the Kanakas in New Caledonia, and, as commander of the French squadron in Tonquin, given the command of the expedition against the Anamites. (See **TONQUIN**.) Commandant Rivière was a graceful and original author of novels, as well as a brave and able officer. Of a long list of tales published under various pseudonyms the most successful were "Pierrot" (1861) and "Cain" (1870). He also wrote two successful plays and two professional treatises, one on the French navy under Louis XV, and one on New Caledonia.

Sabine, General Sir Edward, an English soldier and scientific discoverer, died at Richmond, England, June 26, 1833. He was born in Dublin, Oct. 14, 1788, and entered the army in 1808. The only active service he saw was during the American War of 1812, when he commanded the batteries at the siege of Fort Erie. His mind was turned at an early age to physical science, particularly the subject of terrestrial magnetism. He was appointed astronomer of the first expedition sent in search of a northwest passage, commanded by Sir John Ross, and accompanied the Parry expedition of 1819-'20 in the same capacity. He conducted pendulum experiments near the equator in 1821-'22, to determine the figure of the earth, and in 1825 was one of a commission appointed to determine the difference in longitude between Greenwich and Paris. For many years he carried on privately a series of experiments on terrestrial magnetism and the acceleration of the pendulum in different latitudes. Colonial observatories to determine the dip, intensity, and inclination of magnetism were founded and placed under his direction. He was President of the Royal Society from 1861 to 1871, and actively pursued scientific studies till near the close of his life.

Savret Pasha, ex-Grand Vizier of Turkey, died in Constantinople, Nov. 17, 1833. He was born in that city in 1815, and entered the Government service in early life. He was secretary to the Sultan, and then to the embassy in Paris, became President of the Council of State in 1859, Minister of Commerce and Public Works in 1861, ambassador at Paris in 1865, and Minister of Commerce again in 1866. In 1868 he was appointed Minister of Education, and during his term of office founded the college at Galata, and introduced other educational reforms. He was Minister of Justice in 1872, Minister of Education again in 1874, and Minister of Foreign Affairs in 1875, resigning in 1877 on account of a disagreement with the Grand Vizier over the question of a war with Russia. In 1878 he was again appointed Min-

ister of Foreign Affairs and signed the Treaty of San Stefano. He was made Grand Vizier in June, 1878, and, when succeeded by Khairuddin Pasha in December of that year, accepted the ambassadorship to Paris, resigning in a few months on account of failing health.

Salamanca, José, Marquis of Salamanca, a Spanish financier, died at his villa near Madrid Jan. 21, 1838. He was born in May, 1811. He studied law in the University of Granada, practiced as an advocate, and was appointed judge in Monovar, and afterward Mayor of Vera. He was elected a member of the Andalusian Central Union and sent to the National Cortes in 1837. In Madrid he attracted universal attention by his daring speculations. In 1848 he farmed from the Government the salt monopoly, undertaking to maintain the whole establishment of officials and to pay at least seventy million reales a year. He was Finance Minister for two months under Pachec, but resigned on account of his business, which suffered from his absence. He built an entire new quarter in Madrid, which is called after him. After constructing some important railroads in Spain, he became interested in railroad enterprises in various countries, and projected also the Valladolid Canal. He possessed extensive model and breeding farms. Just before his death he undertook to enlarge the fine old city of San Sebastian, which had many attractions as a bathing-place, but possessed no modern quarter until he recovered the necessary ground from the sea. He was created Marquis of Salamanca and Grandee of Spain in 1866. Since 1837 he had been almost constantly a member either of the Cortes or the Senate.

Sandean, Jules, a French novelist, died May 8, 1833. He was born at Aubusson in 1811, studied in Paris, and, becoming acquainted with Mme. Dudevant, composed in partnership with her a novel which was published in 1831 and signed Jules Sand. They started to compose "Indiana" together, but the lady wrote it herself, and the name George Sand, by which she was thereafter known, was placed on the title-page by the publisher. Jules Sandeau struck out a line of his own, and wrote many novels and plays, one of which latter, "Le Gendre de M. Poirier," written in collaboration with Augier, became exceedingly popular. In 1858 Sandeau became one of the curators of the Mazarin Library, and in 1868 he was elected to the Academy.

Schube-Delitzsch, Hermann, a German socialist, died in Potsdam, April 29, 1833. He was born in Delitzsch, Aug. 29, 1808. His father was burgomaster of the town. He studied law at Leipsic and Halle, and, after serving as assistant judge in Berlin, returned as surrogate to Delitzsch in 1841. His attention was attracted to the difficulties of the class of handicraftsmen about 1843. In 1848 he was chosen to represent his native district in the National Assembly at Berlin, and was made chairman of a committee for the investigation of the dis-

truss of the laboring classes. He became impressed with the idea of co-operation as a means of rescuing the small tradesmen from the difficulty of their situation, owing to the development of manufacturing on a large scale. He organized the shoemakers of his own town into a co-operative association for the purchase of their raw material. Before he could develop his schemes further, he had to sustain a prosecution for sedition, as one of the authors of a resolution to refuse to pay taxes, as a protest against the arbitrary acts of the Government. He was acquitted in 1850, and resigned from the magistracy soon afterward, in order to devote himself to the establishment of associations to secure to mechanics the advantages of the wholesale market in the purchase of raw and partly manufactured materials, the necessities of life, and all articles of regular consumption, and also better credit facilities. Capital was advanced to them on moderate terms, by means of co-operative credit associations, which served also as savings-banks. These banks, established on the principle of joint liability for debts, attracted a great deal of outside capital. Between 1860 and 1876 Schulze wrote numerous popular tracts in defense of the co-operative idea. Lassalle entered the field at the same time as the champion of "state-help," in opposition to "self-help," as exemplified in Schulze's system of co-operation. Germany resounded with their controversy. Although Schulze was no match in wit, eloquence, or dialectic power for his brilliant adversary, he represented the popular thought of the day, formed under the influence of Bastiat's captivating arguments of the harmony of interests between capital and labor. His co-operative stores and banks were organized on sound business principles. They supplied a practical want, and developed into an institution of such colossal proportions and beneficent workings as to justify the impression that they presented the ultimate solution of the social problem. Schulze was the permanent attorney and chief organizer and guide of the co-operative unions. He was elected in 1861 to the Prussian House of Deputies from Berlin, and from 1874 till his death represented Wiesbaden in the Reichstag, attaching himself to the Progressive party, and taking a prominent part in politics.

Spottiswoode, William, an English scientist, died in London, June 27, 1888. He was born there, Jan. 11, 1825. His father was the head of the printing establishment over which he himself presided after he was graduated at Oxford in 1847. He was an accomplished mathematician and Oriental scholar. In 1856 he made a journey in Eastern Russia, of which he published an account. He published, also, a great number of papers on mathematical subjects, and originated new methods of value. He contributed to physical science researches in the polarization of light, and certain forms of electric discharge. He was President of the Royal Society.

Suleiman Bey Sami, an Egyptian soldier, executed at Alexandria, June 9, 1888, on the sentence of a court-martial, which convicted him of having taken a prominent part in the burning of the city after it was evacuated by Arabi. He was the son of Daoud Pasla, a Circassian of high birth, by an Egyptian mother. He was born about 1848, passed through the Polytechnic School at Cairo, and entered the army at an early age, rising by rapid promotion to the grade of major. He served under Prince Hassan in the Russian War of 1878. He sympathized with the national movement, and was appointed by Arabi to the command of a regiment early in 1882. His regiment was quartered at Alexandria, and suppressed the riot on June 11, 1882. He served with his regiment in the defense of the town during the bombardment, and after the evacuation he joined Toulba Pasha at Kafrdawar. After the surrender of Cairo he fled to Crete, and was arrested and delivered up by the Turkish authorities on the representations of the Egyptian Government.

Suleiman Pasha, a Turkish general, died in April, 1888. Having rendered services in the Herzegovinian insurrection and Servian war, he was placed in command of the Army of the Balkans. In defending the Shipka Pass and in the battle of Plevna he showed the highest qualities of generalship, but he was obliged to fall back on the Dardanelles when unable to block the advance of Gen. Gurko from Sophia. After the war he was sacrificed to the wounded patriotism of his countrymen, being tried for treason, and banished to Bagdad.

Tu Duc, Emperor of Anam, died Aug. 8, 1888, at the age of fifty-four years. He was a younger son of Treni-Tri, of the Nguyen dynasty, who nominated him his successor instead of his eldest son, Hoang-Bao. The latter revolted when Tu Duc ascended the throne at the age of nineteen, but was conquered and thrown into a dungeon, where he hanged himself. Tu Duc was the enemy of Europeans. He refused to allow the French envoy to land in 1856, and the following year he put to death the Spanish missionary, Bishop Diaz. The two countries sent an expedition under Admiral Rigault de Genouilly which captured the forts of Turan in August, 1858, and four months afterward attacked Saigon. Admiral Charner in 1862 forced him to sign the treaty of Saigon. Tu Duc sent an embassy to Paris offering an indemnity of \$40,000,000, on condition of the evacuation of the country. The amount was reduced to \$20,000,000, but France retained a protectorate over the conquered provinces, kept Saigon, and compelled the Emperor to throw open three ports on the Cochin-China coast. Tu Duc encouraged the Black Flags in their reprisals on the French, which led to the expedition of 1873, in which Francis Garnier met his death, and to the war in Tonquin.

Viardot, Louis, a French author, died in Paris, May 5, 1888. He was born in Dijon, July 31,

1800; was educated for the magistracy, and, after a journey in Spain, became a writer, publishing an essay on the Moors in Spain, "Studies on the Institutions and Literature of Spain," and a translation of "Don Quixote." He also translated the works of Pushkin, Gogol, and Turgenieff. He was director of the Italian Theatre in 1838 and 1839. A popular exposition of his liberal philosophical convictions was published under the title of "Libre Examen." He was a distinguished art critic.

Webb, Matthew, an English swimmer, was drowned in an attempt to swim through the whirlpool of Niagara river, July 22, 1838. From bruises on his head it was surmised that he struck upon a rock and became unconscious. He was born at Irongate, in Shropshire, Jan. 18, 1848. He was formerly captain of a merchant-vessel, and received one of the first medals given out by the Royal Life-Saving Society, for rescuing a sailor from drowning. His swimming powers were first brought into public notice by the feat of swimming in the Thames from Blackwall to Gravesend in 1875, and, a fortnight later, that of swimming from Dover to Ramsgate in eight and three quarter hours. These were preparatory to an attempt to swim across the English channel. At his first attempt he was compelled to return by adverse currents, but, ten days later, on Aug. 24, 1875, he accomplished it in twenty-one hours. In June, 1838, he landed in the United States, with the intention of attempting the feat which cost him his life.

OHIO. The State officers for the year were as follow: Governor, Charles Foster; Lieutenant-Governor, Reese G. Richards; Secretary of State, James W. Newman; Auditor, John F. Oglevee; Treasurer, Joseph Turney; Attorney-General, George K. Nash; Commissioner of Common Schools, Daniel F. De Wolf; Board of Public Works, Henry Weible, George Paul, and S. R. Hosmer.

Finance.—On Nov. 15, 1882, the public funded debt of the State was \$4,901,665. During the year there was paid \$379,150; leaving the public funded debt of the State Nov. 15, 1883, \$4,522,515. Since November 15th, bonds of the loan payable after Dec. 31, 1886, to the amount of \$31,800 have been paid, leaving the total of the funded debt, \$2,314,050, due after Dec. 31, 1886. The local debts at the same time were as follow: Debts of counties, \$4,381,680.21; debts of cities, first and second class, \$35,231,302.88; debts of incorporated villages, \$1,478,526.56; debts of townships, \$645,751.21; debts of separate (special) school districts, \$1,659,884.64; total local debts, \$48,888,095.50. Net decrease in above local debts, \$2,378,255.72.

Military.—The present force of the Ohio National Guard consists of eighty-two companies of infantry and seven batteries of light artillery, and a total of 5,457 men, including officers, a reduction during the year of 418.

Insane.—About 8,800 insane people are cared for with the present accommodations furnished

by the State, about 1,000 are cared for in the county infirmaries, and there are probably 500 to 1,000 persons in private institutions and with their families and friends.

Railroads.—The report of the Commissioner of Railways shows a steady growth in the mileage and in the business of the railways of Ohio. There were, June 30, 1883, 6,900 miles of railway in the State, an increase over the number of miles of the preceding year of 18.06 per cent. The capital stock of these railways represents a value of \$250,748,376.17, an increase of 4.9 per cent. The capital stock and debt make the sum of \$478,069,485.16, showing a decline in the indebtedness of 9.55 per cent. The business of this year was an advance of the preceding in the number of passengers, 7.42 per cent.; in the passenger mileage, 2.99 per cent.; in the tonnage, 4.01 per cent.; in ton mileage, 4.04 per cent. The average rate per mile was 2.499 cents, an advance over the former year's rate of 5.6 per cent. The average rate per ton per mile upon freight, 8.75 cents, an advance in the rate of 8.24 per cent. The gross earnings of the year were \$49,900,506.26, an increase of 9.02 per cent. The net earnings were \$16,326,218.37, an increase of 18.53 per cent., making 3.42 upon the total amount of stock and debt. The operating expenses of the year were \$33,574,292.89, an advance of 4.64 per cent. These operating expenses were 67.28 per cent. of the gross earnings. Sixty-eight per cent. of the railways of Ohio are now laid with steel rails. There are 38,723 men employed, an average of 5½ men to the mile.

Coal.—The Inspector of Mines estimates a falling off of the output of the mines of 1,250,000 tons as compared with last year. This is attributed to the present depressed condition of the iron industry, into which the consumption of coal so largely enters.

Crops.—The Secretary of the State Board of Agriculture says the wheat and corn were much damaged by frost, the latter suffering most. The total wheat-crop was placed, in October, on the basis of the returns then received, at 25,500,000 bushels, but later reports showed so much of it shrunken that it was not believed it would make the flour of more than 21,000,000 bushels, or just half an average crop. The total number of acres in corn was 2,499,000; bushels per acre, 2.83; total estimated bushels, 70,741,000, against 90,869,000 in 1882, and a ten years' average of 100,000,000 bushels. The yield per acre, 28.3 bushels, is the lowest for thirty-three years, except 1854, 1856, 1863, and 1864, when it was 26, 27.7, 27.7, 27, and 27 bushels respectively. The total number of acres in potatoes was 106,400; bushels per acre, 118; total bushels estimated, 12,132,600, against a ten years' average of 75.9 bushels per acre, and 8,754,578 bushels total a year.

Live-Stock.—The report of the State Board of Agriculture shows the following percentages of the different breeds of live-stock: Cattle—Per cent. of Shorthorns, 65; Herefords, 2;

Devons, 8; Poled Angus, 1; Jerseys, 19; Ayrshires, 2; Holsteins, 3. Horses—Thoroughbreds, 6; roadsters, 19; general purpose, 52; draught, 23. Sheep—Merinos, 58; Downs, 16; Longwoods, 26. Swine—Poland-Ohinas, 46; Berkshires, 27; Ohester Whites, 21; Jersey Reds, 6. Poultry—Egg-producers, 51; meat-producers, 49. Condition of farm animals, compared with last autumn, 93.

Temperance Legislation.—The Legislature began its adjourned session January 2d, and closed April 19th. Aside from the time occupied in the perfection of the appropriation bills, the greater part of the session was taken up with the liquor question. In his address to the General Assembly at the beginning of the session, Gov. Foster said:

The liquor-traffic will bring to your attention a question that engages the thoughts of the people more deeply and seriously than any other subject that will come before you. The enormity of the evil is admitted by all, as well as its disastrous effects upon society, and the magnitude of the burdens of taxation imposed by it upon the people, through private and public charities, was never as great as at present. When the present Constitution was adopted, a clause was voted into it by the people, under the belief that through it would be secured a greater restraint to the traffic than had previously existed. Experience has shown that, instead of greater restraint, we have practically free trade in liquor, not only six days in the week, but on Sunday also. In fact, in many localities, Sunday, instead of being, as the law and well-being of society demand, a day of rest and recreation, has become a day of rowdyism and carnivals; instead of being the most orderly, it has become the most disorderly day of the week. It is a humiliating fact that we have in Ohio, to-day, more than 16,000 places where this unrestrained traffic is carried on, taking the hard-earned wages from many thousands of our citizens, whose families need the money thus worse than thrown away. This entire traffic, the amount of which in round numbers will probably exceed \$70,000,000 annually, much the larger portion of which is profit, contributes but a tithe of the burden it imposes upon the public through the crime and pauperism created by it.

The laws upon our statute-books, enacted by both of the great political parties, for the avowed purpose of limiting and restraining the evil effects of this traffic, are, to all intents and purposes, except in a few localities, inoperative. I am fully of the opinion that the principle of taxation, judiciously applied to this traffic, will furnish the most satisfactory solution of the problem "How to deal with the liquor-traffic" that is attainable. There seems to be a popular demand for the submission of a constitutional amendment, such as was proposed by the Cleveland Convention, to be voted upon in October, 1883. The following is a copy of the resolution referred to:

Resolved, That the public interests require that the General Assembly should submit to a vote of the people such amendments to the Constitution of the State relative to the manufacture, sale, and use of intoxicating liquors as shall leave the whole matter to legislation."

Such an amendment ought to be submitted to a vote of the people.

The attempts of the majority to carry these suggestions into effect were rendered fruitless, until near the end of the session, mainly through inability to agree upon the exact form rather than from disagreement on the principles involved. Finally, two propositions for

constitutional amendments were agreed upon for submission to the people at the October election. They read as follows:

FIRST PROPOSITION.

The additional section in and with section 18 of the schedule shall be repealed, and there shall be substituted for it the following:

The General Assembly shall regulate the traffic in intoxicating liquors so as to provide against evils resulting therefrom; and its power to levy taxes or assessments thereon is not limited by any provision of this Constitution.

SECOND PROPOSITION.

The additional section in and with section 18 of the schedule shall be repealed, and there shall be substituted for it the following:

The manufacture of and the traffic in intoxicating liquors to be used as a beverage are forever prohibited; and the General Assembly shall provide by law for the enforcement of this provision.

This was speedily followed by the passage of a law for the taxation of the liquor-traffic, and the change of existing laws relating to that traffic. From the name of the member introducing it in its original form, it became known as the "Scott law." The title was "An act further providing against the evils resulting from the traffic in intoxicating liquors." The law imposes a tax of \$200 yearly on every place where liquors are sold at retail; prohibits, under penalty of \$100 fine and imprisonment, the opening of such places on Sunday; and forbids the sale of liquor to a minor, except on the written order of his parent, guardian, or physician.

The Liquor Law constitutional.—The liquor-tax bill had no sooner passed, than an organized effort to oppose it was begun. To facilitate a decision, a case was made in Athens county: the Auditor refusing to publish the notice required by the law, and application being thereupon made by the Attorney-General, in behalf of the State, for a writ of mandamus to compel him to comply with the law. Arguments were heard June 7th and 8th, and the case was reserved for consideration, together with a case coming at the same time from Ouyahoga county, in which the constitutionality of the provision affecting existing leases was brought into question. The decision of the Supreme Court was given June 26th, and sustained the constitutionality of the law.

Other Legislation.—Among the other measures of the session were a law providing for the security of wages of men engaged in the construction of railroads; a law providing for the appointment of a commission with a view to establishing a mode by which differences between miners and employers may be settled; an amendment to the lien law in the interests of laborers; laws facilitating the dispatch of legal business; and the submission to popular vote of a proposed amendment to the Judicial article of the Constitution.

Political Conventions.—The Republican State Convention was held at Columbus, June 5th and 6th. The ticket nominated was as follows:

Those marked with a * were renominations: For Governor, Judge J. B. Foraker, Hamilton county; Lieutenant-Governor, William G. Rose, Cuyahoga county; Supreme Judge (term ending Feb. 9, 1887), * William H. Upson, Summit county; Supreme Judge (term ending Feb. 9, 1889), * John H. Doyle, Lucas county; Clerk of Supreme Court, * Dwight Crowell, Ashtabula county; Attorney-General, M. B. Earnhart, Miami county; Auditor of State, * John F. Oglevee, Clarke county; Treasurer of State, John C. Brown, Jefferson county; State Commissioner of Common Schools, * Daniel F. De Wolf, Lucas county; and Member Board of Public Works, Leo Weltz, Clinton county. The platform declared for a protective tariff; for a restoration of the wool-tariff of 1867; for a National Bureau of Labor Statistics; in favor of the liquor-tax law; for abolition of contract system in prisons; in favor of civil-service reform; and approving President Arthur's administration.

The Greenback-Labor party held its State Convention in Columbus, June 18th. The following ticket was nominated: For Governor, Charles Jenkins, of Mahoning county; for Lieutenant-Governor, William Baker, of Licking county; for Supreme Judges, H. A. Chamberlain, of Lucas county, for short term, and James R. Grogan, of Hocking county, for long term; for Clerk of the Supreme Court, William Bentz, of Franklin county; for Attorney-General, L. G. Tuttle, of Lake county; for Auditor of State, J. H. Rhodes, of Sandusky county; for Treasurer, John Seitz, of Seneca county; for Commissioner of Common Schools, J. Murray Case, of Franklin county; for Member of Board of Public Works, Dr. J. J. Scribner, of Knox county.

The State Convention of the Prohibitionists was held at Columbus, June 14th. There were divided councils in the party, a strong movement being made to omit the nomination of candidates and concentrate all temperance work upon the adoption of the prohibition amendment to the Constitution. At a preliminary conference, held June 18th, the question was thoroughly discussed, and the majority present determined on putting a ticket in the field. At the convention, therefore, a full ticket was nominated, as follows: For Governor, Ferdinand Schumacher, of Summit county; for Lieutenant-Governor, H. D. Ogden, of Hamilton county; for Supreme Judge, Z. C. Payne, of Franklin county, for short term, and long term, D. C. Montgomery, of Knox county; for Clerk of Supreme Court, J. H. Blackford, of Preble county; for Attorney-General, J. W. Roseborough, of Fulton county; for Auditor of State, Gersham Lease, of Hardin county; for Treasurer of State, J. M. Whiting, of Huron county; for Commissioner of Common Schools, H. A. Thompson, of Franklin county; for Board of Public Works, G. Z. Cruzen, of Hardin county.

The Democratic State Convention was held

at Columbus, June 21st. The interest turned wholly on the nomination for Governor, there having been a very keen preliminary canvass in the interest of Judge Hoadly, Gen. Durbin Ward, and Judge Geddes. The interest was intensified by the appearance of ex-Senator Thurman as a delegate, and by his earnest appeal in behalf of Gen. Ward. It was, however, unavailing, Judge Hoadly being nominated on the second ballot. The following was the full ticket nominated: For Governor, George Hoadly, of Hamilton county; for Lieutenant-Governor, John G. Warwick, of Stark county; Supreme Court, short term, M. D. Follett, of Washington county; Supreme Court, long term, Selwyn N. Owen, of Williams county; Clerk of Supreme Court, J. W. Cruikshank, of Miami county; Attorney-General, James Lawrence, of Cuyahoga county; Auditor of State, Emil Kiesewetter, of Franklin county; Treasurer of State, Peter Brady, of Sandusky county; for School Commissioner, L. D. Brown, of Butler county; for Board of Public Works, Martin Schilder, of Ross county. The platform favored "a tariff for revenue, so adjusted as to encourage productive industries at home, but not to create or foster monopolies"; providing against the evils of the liquor-traffic "by a judicious and properly graded license system"; abolition of the contract system in the prisons; and civil-service reform.

A State Convention of temperance workers in the interest of the prohibition amendment was held at Columbus, July 24th. This was designed as a protest against the action of the Prohibition Convention which placed a Prohibitionist State ticket in the field. It passed a series of resolutions, the significant one being the following:

That inasmuch as the practical effect of voting for the first amendment will be to favor license; and of voting for neither of the amendments will be to vote against prohibition; and the practical effect of voting for both will be to practically diminish the probability of securing the necessary majority for the second, we most earnestly entreat that each vote be cast for the second amendment and that only.

Election.—The political canvass that followed was one of great earnestness, and engaged more general attention than any election for State officers in many years. An unprecedented feature was the part taken in it by the women. Under the lead of the Women's Christian Temperance Union, whose headquarters were in Cleveland, the whole State was organized in behalf of the second or prohibition amendment, without regard to party lines. A campaign paper was published, and campaign literature thoroughly distributed by the women and their sympathizers. House-to-house canvassing by women was general, and on election-day the women were at the polls in many parts of the State, both in the villages and in the large cities, distributing tickets of all the parties with an affirmative vote for the second amendment. The election was held on Tuesday, October 9th, and resulted in a complete

victory for the Democratic party. The following are the official figures of the vote :

GOVERNOR.	
George Hoadly, Democrat.....	859,798
Joseph F. Foraker, Republican.....	847,164
Ferdinand Schumacher, Prohibition.....	8,862
Charles Jenkins, Greenback-Labor.....	2,987
Scattering.....	19
LIEUTENANT-GOVERNOR.	
John G. Warwick, Democrat.....	856,418
William G. Rosa, Republican.....	850,009
Henry T. Ogden, Prohibition.....	8,881
William Baker, Greenback-Labor.....	2,984
Scattering.....	9
JUDGE OF SUPREME COURT—SHORT TERM.	
Martin D. Follett, Democrat.....	860,404
William H. Upson, Republican.....	846,481
Zeno C. Payne, Prohibition.....	8,208
Henry A. Chamberlain, Greenback-Labor.....	2,940
J. H. Upson.....	615
Scattering.....	5
JUDGE OF SUPREME COURT—LONG AND UNEXPIRED TERM.	
Selwyn N. Owen, Democrat.....	859,679
John H. Doyle, Republican.....	846,803
David G. Montgomery, Prohibition.....	8,916
James Grogan, Greenback-Labor.....	2,892
Scattering.....	6

Elections for members of the sixty-sixth General Assembly were also held, resulting as follows :

	Senate.	House.	Joint ballot.
Democrats.....	22	60	82
Republicans.....	11	45	56
Total.....	33	105	138

The following was the vote on the constitutional amendments :

Total number of votes cast.....	731,810
Judicial amendment—Yes.....	400,999
Judicial amendment—No.....	141,686
Regulation and taxation of liquor-traffic—Yes.....	99,849
Regulation and taxation of liquor-traffic—No.....	192,117
Prohibition of intoxicating liquors—Yes.....	828,189
Prohibition of intoxicating liquors—No.....	240,975

To carry either of those amendments required a majority of all the votes cast. The judicial amendment was the only one receiving the required majority, and was therefore the only one adopted.

The Liquor-Question revived.—The defeat of the prohibition amendment was claimed by its supporters to be due to foul play on the part of the election officers. Unofficial recounts were made in some counties, and it was claimed these indicated a falsification of the returns to an extent that affected the result. No legal steps were taken, however, to dispute the count. But the liquor-question was not finally disposed of by the vote on the constitutional amendments. On the 27th and 28th of December the liquor-dealers held a State Convention in Columbus, at which a preamble and resolution were adopted, declaring the Scott law unconstitutional and unjust, and asking the Legislature to enact a judicious and constitutional law in place of it.

This brought into immediate action the Women's Christian Temperance Union, which prepared for a new struggle by sending out

circulars for signatures to a petition to the General Assembly, declaring that the second amendment received a majority of the ballots cast, but they were not honestly counted; and asking that a single proposition, to amend the Constitution so as to prohibit the manufacture and sale of intoxicating liquors within the State, be submitted to a popular vote.

Woman Suffrage.—The Woman's Suffrage Association of Ohio met in convention at Columbus, June 18th, and effected a permanent organization by the election of officers for the ensuing year, including the following: President, Prof. N. S. Townshend, of Columbus; Recording Secretary, Dr. Kate Kelsey, Elyria; Corresponding Secretary, Miss Francis G. Janney, Columbus; Treasurer, Mrs. Elizabeth Coit, Columbus. This was the first concerted movement of the advocates of woman suffrage in the State for several years, and, although the attendance at the convention was small, the reports of those present were hopeful.

ONTARIO, a province of the Dominion of Canada. Area, 220,000 square miles; population in 1881, 1,923,228. Capital, Toronto.

Climate.—The southwestern peninsula, between Lakes Huron and Erie, enjoys a much milder climate than Toronto. In the northern districts early and late frosts sometimes occur, but rarely damage the crops. At Toronto, which occupies the average position regarding temperature, the mean for the forty-one years ending 1882 was 44°16' F., the extreme ranges of mean annual temperature being 47°09' in 1878 and 40°77' in 1878. The average of the warmest months for that period ranges from 76°66' in 1881 to 64°46' in 1860; and of the coldest months from 10°16' in 1875 to 26° in 1848. The coldest day was in 1859, when the mercury fell to -26°5', the mean temperature of the day being -14°38'.

Agriculture.—The settled portion of Ontario, the peninsula south of the forty-sixth parallel, is admirably fitted for agriculture, more especially the western and central districts. The chief products are wheat, barley, oats, corn, and potatoes. The value of good farms varies from \$60 to \$140 an acre. The provincial Government has always encouraged advanced farming, and supports a fine agricultural college. In the eastern portion of the peninsula a wing of the Laurentian plateau crosses, but the land is good for grazing and dairy purposes. The northern regions of this peninsula, lying between the Georgian Bay and the river Ottawa, are well timbered with pine and oak, chiefly the former. In the counties along the Lake Erie shores, the finer cabinet-woods abound. This district is also well adapted for vineyards and fruit-growing, which is extensively carried on.

Minerals and Oil.—Mining in Ontario is in its infancy. Petroleum-wells exist in the southwestern peninsula, in Campton county, at the foot of Lake Huron. There are salt-wells at Clinton, Seaforth, and Blyth, in Huron county,

near Lake Huron. Very profitable iron-mines are being worked all through the northern portion of the southern peninsula, in Victoria, Peterboro, Hastings, Frontenac, and Lanark counties. Copper and silver mines are in successful operation on the shores of Lakes Huron and Superior, and fine building and limestone quarries exist throughout the province.

Cities.—The following are the cities of Ontario, with their population in round numbers: Toronto (exclusive of Yorkville), 96,000; Hamilton, 36,000; Ottawa, 27,000; London, 20,000; Kingston, 15,000; Guelph, 10,000; St. Catharines, 10,000; Brantford, 10,000; Belleville, 10,000; St. Thomas, 10,000.

Commerce.—The chief trade is with the United States. Large quantities of grain reach Collingwood, Midland, and Parry Sound, on Georgian Bay, from Chicago. Milwaukee, and other American ports, to be transported to the lumber-shanties, or to pass to Toronto, Port Hope, or Belleville by rail, and thence to Europe by Montreal and the river St. Lawrence.

Industries.—During the year ending June 30, 1882, the exports of agricultural products of Ontario were valued at \$19,416,299. Of this amount all but \$73,115 was the product of the province. Under the name "grazing," or "animals and their produce," the exports of the growth of Ontario were \$7,506,888, of which \$3,250,762 went to Great Britain, \$4,214,329 to the United States, and the rest to Germany, the West Indies, etc. Of the agricultural products, \$9,872,432 is barley, every bushel of which went to the United States; \$2,320,198 is wheat; \$1,519,748 is flour of wheat; \$1,108,401 is malt, all to the United States; \$862,296 is rye, of which \$815,703 went to the United States; \$724,753 is potatoes, all to the United States; \$833,794 is peas, nearly all to the United States; seeds, \$833,126; hay, \$176,390; and beans, \$158,798, were all shipped to the American market; oats, \$221,924.

Lumbering, including timber in all forms, constitutes the second industry, both in respect to value of exports and also with regard to the number of persons employed. The exports are chiefly of pine. Under the heading "The Forest," the figures show an export of Ontario produce, amounting to \$8,015,485, of which \$8,009,984 went to the United States.

Manufacturing is in its infancy in Ontario, but the high protective tariff which came into operation in Canada in 1878-'79 has done much to turn the attention of capitalists to manufactures. The exports are small, but it must be considered that under a high protective tariff the home market is to a large extent controlled by the home manufacturer. For the year taken for illustration, the exports under this heading were \$1,106,804 of actual Ontario manufacture. Of this, \$238,775 were to Great Britain, and \$715,051 to the United States.

Mining products were exported to the amount of \$240,001—all to the United States.

These exports were chiefly iron and silver ores, phosphates, and salt.

The export product of the Ontario fisheries was \$158,706, of which \$157,528 went to the American market.

The total value of the export trade of Ontario reaches \$37,087,901. That there is a close union, commercially as well as socially, between this province and the States of the American Union along the lakes, is forcibly demonstrated by the fact that over \$29,000,000 of this amount went to the United States.

Education.—The system of education in Ontario is very thorough, and its organization and administration are systematic and complete. The Education Department controls the public separate, and high schools of the province. The Education Department was presided over by a Chief Superintendent of Education until February, 1876, when a Minister of Education was appointed, who is a member of the Executive Council of the province, and is responsible to the Legislative Assembly. The several classes of schools form a complete series of progressive steps, from the primary school to the university, all under the control of the Government. The immediate management in school matters is vested in local boards.

The school funds are obtained from three sources: 1. An annual grant from the Government of \$250,000. 2. County rates, \$800,000. 3. Local rates and funds, about \$2,500,000.

The school population (comprising only children between the ages of five and sixteen years) in 1880 was 494,424, and the school attendance in the same year was 437,012. There are in the province 5,195 public schools, in which 6,747 teachers are employed. The average salaries paid in 1880 to public-school teachers were:

	Counties.	Towns.	Cities.
Males	\$552	\$564	\$743
Females	241	256	324

There are two normal schools in the province, conducted by the Education Department, one at Toronto and one at Ottawa.

There are one hundred and five high-schools in the province, and the annual expenditure in connection with them is about \$425,000, of which sum the Government contributes by legislative grant about \$85,000.

Where there are a sufficient number of Roman Catholics in a section or municipality to support a separate school, they are allowed to pay their local school rates for the support of such a school. There are over two hundred separate schools in Ontario.

The University of Toronto was established by royal charter in 1828, and endowed with a grant of public lands. The annual income from this endowment is nearly \$60,000. The institution was inaugurated in 1828. The building is the finest single college-building in America.

Upper Canada College is in Toronto. It

was founded in 1828, on the model of the great public schools of England. It is controlled by a committee of the Senate of the University, in connection with the Education Department.

The School of Practical Science is devoted to the special study of the physical sciences and engineering. It may be regarded as a department of University College devoted to technical training. The School of Agriculture is at Guelph. The regular course extends over two years, and includes agriculture, horticulture, natural science, including chemistry, veterinary surgery, anatomy, and physiology. The farm in connection with the institution contains 550 acres.

The Institution for the Blind is in Brantford. It was founded in 1871, and is conducted chiefly at the expense of the country. There is an attendance of about 150. The Institution for the Deaf and Dumb is in Belleville. It was instituted in 1870. The general expenses are paid by the Government. The pupils, numbering over 200, are taught practical industries, as well as from text-books.

ORD, Edward Othe Cresap, an American general, born in Allegany co., Md., Oct. 19, 1818; died in Havana, July 22, 1888. His father was Lieut. James Ord, an officer in the War of 1812. Young Ord was graduated at West Point Academy in 1839. He entered the army as second lieutenant of artillery, and was assigned to the Third Regiment, which he joined in Florida. He served several years in that State, and was actively engaged in constant fights with the Seminoles. In 1846 he was sent to California, and during the Mexican War he was very efficient in preserving law and order on the Pacific coast. He was made captain in 1851, and was assigned to the Third Artillery. For several years he was occupied on the Atlantic coast, chiefly in garrison duty. He was then ordered again to California, where he found full scope for his energies in efforts to keep order among the wild Indian tribes in Washington Territory and Oregon, and to check their attacks and depredations. He met with unusual success, and the inhabitants of that section were loud in his praise.

On the outbreak of the civil war, Capt. Ord was raised to the rank of brigadier-general of volunteers, with his commission dating from September, 1861; and subsequently, when Congress rearranged the regular army, he was promoted to the rank of major of the Fourth Artillery, his commission dating from November, 1861. He was then assigned to the command of the Third Brigade of Pennsylvania reserves, under Gen. McCall, who had raised and organized fifteen regiments from that State. With his portion of the forces Gen. Ord, in December, 1861, crossed into Virginia from Tennesseetown, and on the 20th of that month defeated the Confederates under Stuart, at Dranesville, near the Potomac. This action was not only highly creditable to the commander,

but also did much toward restoring to the Army of the Potomac that *morale* which had been sadly injured by the conclusions to the battles of Bull Run and Ball's Bluff.

When the Army of the Potomac was preparing for a forward movement, Gen. Ord had charge of a brigade, but, having been made major-general of volunteers, he was withdrawn and assigned to a command under Gen. Halleck, with the army operating in the Department of the Mississippi. He commanded the wing of the army which advanced upon Iuka from the north, and, though he did not take a direct part in the battle, the commanding general in his dispatches spoke highly in his praise. In October, 1862, during the engagements before Corinth, Gen. Ord's position was at Bolivar. He pushed forward to the assistance of Corinth, and fell in with the enemy on the south side of the Hatchie. He drove them across the river, captured the heights, and took 200 prisoners and two batteries. He was wounded early in the battle, and carried off the field. His next active service was in 1863, when he succeeded Gen. McClernand in command of the Thirteenth Army Corps. He took part in the operations which ended in the surrender of Vicksburg, July 4, 1863. When a movement was made the same month upon Jackson, Miss., he commanded the right wing of Gen. Sherman's army, and thus assisted in clearing that part of the State of organized Confederate forces. He was ordered to New Orleans, but, in consequence of illness, was relieved, Oct. 28, 1863. He resumed his command, but his health proved too delicate for active service during the remainder of the year.

During Gen. Grant's movement from the Rappahannock to the James, a demonstration was made by way of the Shenandoah valley upon Washington, Maryland, and Pennsylvania. Gen. Ord was thereupon assigned, July 11, 1864, to the command of the Eighth Army Corps and the troops in the Middle Department, and at once set about reorganizing affairs in and around Baltimore. After quiet was restored he was assigned to the command of the Eighteenth Army Corps, then operating near Petersburg. He took part in the operations before that city, and, having crossed to the north side of the James, Sept. 29, 1864, he led the forces which carried the strong fortification and long line of intrenchments below Chapin's farm. He captured on this occasion fifteen pieces of artillery and nearly 800 prisoners; but, during the assault, he received a wound which temporarily disabled him. When the Tenth and Eighteenth Corps were consolidated Gen. Ord was placed in command, but, owing to ill-health, he was relieved for a time by Gen. Weitzel. After the return of the troops from Fort Fisher, he again resumed command of his corps; and, when Gen. Butler was removed, early in January, 1865, he was appointed successor in command of the Department of Virginia and the Army of the

James. He also participated in the operations which resulted in the evacuation of Richmond.

After the return of peace he commanded the Departments of California, the Platte, and Texas. In January, 1881, he was placed on the retired list according to his brevet rank. Gen. Ord, on leaving the service, accepted an appointment as engineer in the construction of a Mexican railroad. His health suffered from this severe labor, and he was on his way North, in a steamer from Vera Cruz to New York, when he was seized with yellow fever. He was taken on shore at Havana, and died suddenly. In personal character, as well as in soldierly skill, Gen. Ord ranked high, and he was always careful for the comfort of the men under his command, especially of the sick and wounded.

OREGON. State Government.—The following were the State officers during the year: Governor, Zenas F. Moody, Republican; Secretary of State, R. P. Earhart; Treasurer, Edward Hirsch; Superintendent of Public Instruction, E. B. McElroy. Judiciary, Supreme Court: Justices, Edward B. Watson, William P. Lord, and John B. Waldo.

State Institutions.—The number of convicts in the Penitentiary on December 31st was 237. The new Insane Asylum at Salem was completed during the autumn of this year. Work was begun on the foundation in May, 1881. The building is on the summit of a knoll. The grounds are at a convenient distance from the business part of the city, being about half a mile north of the Penitentiary, and directly opposite the Orphans' Home. There are about 107 acres that properly belong to the asylum. The building stands, completed, at an expense to the State of less than \$144,000.

The number of children of school age in the State is 69,076. The State University received during the year from Henry Villard the gift of \$50,000 of the first general mortgage bonds of the Northern Pacific Railway Company, bearing 6 per cent. interest.

The university fund, if it were all kept at interest at 8 per cent., would yield \$5,648.86, but that is not probable. There is probably \$20,000 of the land grant yet unsold, and as this is disposed of the fund will be increased accordingly. But it is not likely that from this source it will ever reach more than \$90,000.

The attendance in the collegiate department during the year 1882-'83 was as follows: Whole number enrolled, 154—first term, 145; second term, 128; third term, 94: average of the terms, 121. Of these, 88 were free and 71 pay students—57 of the former being men and 27 of the latter women.

The number of students enrolled in the preparatory department for the year was 63—the first term, 47; second term, 58; and third term, 34: average, 44. Of these, 38 were girls and 25 boys—19 of whom passed their examination and entered the collegiate department.

Indian School.—The school for the education and industrial training of Indian children has been in operation at Forest Grove for three years. It has an attendance of 150 pupils. It was at first difficult to get the pupils to come to the school, but now many more wish to come than can be accommodated. All the clothing worn in the school, including boots and shoes, is made by the pupils.

Salmon-Fisheries.—There were packed on the Columbia river during the year, 629,438 cases of salmon. Placing the product for 1883 at 630,000 cases, the value of the pack foots up \$3,024,000. This is at a valuation of \$4.80 per case. The following table exhibits the growth of the industry:

YEAR.	Pack.	Number of boats.	Market price.	Cost of fish.
	Cases.		Cents.	Cents.
1866	4,000	2	\$16 00	15
1867	12,000	15	18 00	15
1868	22,000	25	19 00	20
1869	100,000	85	10 00	20
1870	150,000	50	9 00	20
1871	200,000	75	9 50	20
1872	250,000	100	8 00	22½
1873	250,000	125	7 00	25
1874	250,000	250	6 50	25
1875	275,000	300	5 50	25
1876	450,000	400	4 50	25
1877	460,000	450	5 20	25
1878	460,000	550	5 00	25
1879	480,000	750	4 60	50
1880	580,000	900	4 80	50
1881	550,000	1,200	5 00	67
1882	550,000	1,500	5 00	75
1883	629,000	1,700	4 80	90

The shipments for the year were:

To San Francisco	276,174
To England	286,630
To New York by sea	14,970
Eastward by rail	25,586
Total	641,360

Commerce.—The total value of Columbia river exports for 1883 was as follows:

ARTICLE.	Domestic.	Foreign.	Total.
Wheat	\$253,150	\$3,424,741	\$3,677,891
Flour	706,693	1,245,800	2,052,493
Salmon	1,739,108	1,856,065	3,595,173
Wool	1,686,745		1,686,745
Oats	18,168		18,168
Barley	1,266		1,266
Potatoes	21,205		21,205
Bran	4,241	220	4,461
Mill-stuff	5,688		5,688
Onions	2,465		2,465
Apples	4,377		4,377
Other fruit	2,082		2,082
Dried apples	26,775		26,775
Dried fruit	12,899		12,899
Flaxseed	84,905		84,905
Hides	201,455		201,455
Felts and skins	41,710		41,710
Woolens	855,000		855,000
Barrel stock	19,311		19,311
Leather	38,051		38,051
Tallow	5,861		5,861
Butter	15,556		15,556
Eggs	27,298		27,298
Hops	36,218		36,218
Lumber	262,423	14,391	276,814
Spars		650	650
Other articles	794,187	5,000	801,187
Total	\$4,212,512	\$4,178,667	\$8,391,179

The imports, domestic and foreign, amounted to \$28,078,594. These figures are not in all respects complete, but they are as nearly so as it was possible to make them. The product of the mines of eastern and southern Oregon is at least \$1,000,000.

Railroads.—The most important incident of the year was the completion of the Northern Pacific Railroad. Although but four months had passed at the close of the year since the last rail was laid, the advantages of direct connection with the Eastern States were already felt in every part of Oregon and Washington. The new line is rapidly working a revolution in the business of the country. Relations long existing with San Francisco still retain a hold, but their grasp is gradually loosening, and the time is not far away when the people will only buy in California things which are produced there. The trade of the Northwest is turning eastward, where buyers have equal opportunities with the San Francisco houses which have heretofore supplied them.

The most conspicuous effect of the new direct connection is the presence of hundreds and thousands of new people. Immigrants were arriving at the close of 1883 at a rate which would add 40,000 to the population in a year. Most of the new-comers are farmers, and nearly all have a little capital.

The Northern Pacific, on the 1st of January, had the following completed mileage in the Northwest:

From Wallula northeast to Montana	Miles. 850
From Kalama, on the Columbia river, to Tacoma, on Puget Sound	105
From Tacoma southeast to Wilkeson (about)	89
Total	1044

Added during the year:

From Portland to a point opposite Kalama	Miles. 42
From point opposite Ainsworth up to Yakima river	25
Present total mileage	1111

The Yakima branch will be extended twenty-five miles immediately.

At the beginning of the year the Oregon and Transcontinental Company had not a mile of road in the Northwest, but since that time it has completed two lines connecting with the Northern Pacific, as follows:

From Stuck River Junction to Black River Junction (the link connecting Seattle and Tacoma)	Miles. 90
From Palouse Junction to "front," eight miles east of Colfax	101
Total	191

The latter road is being rapidly extended, and will terminate at Moscow, I. T., reaching that point early in 1884.

At the beginning of the year the Oregon

Railway and Navigation Company had the following mileage:

From Portland to Bolles Junction, W. T.	Miles. 270
From Bolles Junction to Dayton, W. T.	19
From Bolles Junction to Riparia, W. T.	81
From Umacilla to Pendleton	48
Total	418

Added during the year:

From Pendleton to four miles east of the summit of the Blue mountains	60
From Walla Walla to Blue Mountain station	20
From Pendleton toward Blue Mountain station	7
Total for the year	87
Present total mileage	505

The Baker City branch is being pushed with vigor, and it is proposed to extend it to a junction with the Oregon Short Line at Huntington, 117 miles east of its present front, during the coming year. The Pendleton and Walla Walla link was to be completed early in 1884.

At the beginning of the year the Oregon and California Company had the following completed mileage:

From Portland south to the "front," 54 miles south of Roseburg	Miles. 302
From Portland to Corvallis	97
Total	400

Added during the year:

Extension south of Roseburg	70
Total present mileage	470

During the coming year this line will be extended to a junction with the California section of the road, south of the State line.

The Oregon Improvement Company is building a line twenty-five miles or longer east from Seattle to the coal-fields of Green river. It will be completed early in 1884.

The Oregon Short Line is coming rapidly westward, and will meet the Oregon Railway and Navigation road at Huntington, Idaho, in the autumn of 1884.

Temperance and Female Suffrage.—The annual meeting of the State Temperance Alliance was held at Albany on February 21st. There were present 287 delegates, representing 85 organizations, as follows: Lodges, 29; churches, 20; Sunday-schools, 18; alliances, etc., 7; Blue-Ribbon Clubs, 4; W. O. T. U., 3; Band of Hope, 2; United Order of Ancient Templars, 2.

The Woman's Christian Temperance Association of Oregon held its annual meeting in Portland, on June 15th. No action of special importance was taken by either body. The Oregon State Woman Suffrage Association held its eleventh annual convention in Portland on the 18th of February. Measures were taken toward a vigorous campaign in behalf of the constitutional amendment which is to be submitted to the people in June, 1884.

P

PALESTINE, GERMAN COLONIES IN. The first German colony in Palestine was founded in 1872, when several families from Würtemberg formed a settlement near Jaffa. They were industrious and hardy, and showed themselves well fitted to cope with the numerous difficulties that beset them from the beginning. They established, close by the city, model farms and households, manufactories for agricultural implements, and shops which turned out excellent wagons. Continued success attracted new settlers, and the colony has grown steadily and would enjoy the promise of a still more rapid increase if it could obtain new grants of land.

At about the same time this colony was founded, another company of Germans obtained a grant of a considerable tract of land at Caïpha, at the foot of Mount Carmel, between Cape Carmel and the ruins of Cæsarea. This colony, which is much more important than that of Jaffa, has had a very prosperous career. Its forty modest, whitewashed houses present an appearance of order and neatness in marked contrast with the squalid huts of Caïpha. The colony, numbering about four hundred souls, has its own administration, in a kind of city council, over which the resident consul has supervision. It presents the model of a German city to the Asiatic population, and an example of quiet and moral behavior. The people are moderate Protestants, and free from sectarian strife. Their farms are well appointed, and yield four or five times as much as similar lands in the hands of the native population. The soil is very productive under any kind of cultivation, and makes extraordinary returns under the care of a good farmer. A third colony has been established in the vicinity of Jerusalem, near the Russian hospital. It was founded mainly for purposes of trade, and has prospered. Through the agency of these settlements, German influence has already become considerable in Palestine, and bids fair to be an important factor when the Syrian question again comes up. The Arabs and Turks, who are most strongly impressed by military success, have held the Germans in great respect since they defeated the French in 1871; while the German colonies, under the care of Prince Bismarck, have enjoyed a steady growth since 1872. Prussia has obtained the convent of the Knights Templars as a present from the Sultan, and on the 7th of April, Prince Frederick Charles took formal possession of the ruins of Cæsarea, an ancient seaport halfway between the German settlements at Jaffa and Caïpha, which the Sultan had conveyed, with the neighboring lands, to the German Emperor. The growth of these two colonies toward each other, if it continues, will bring the whole Syrian coast, from Cape Carmel to Jaffa, under German predominance.

PALMER, Edward Henry, an English Oriental scholar, born in Cambridge, England, Aug. 7, 1840; murdered by Bedouin Arabs of the Desert about the middle of August, 1882. Both his father and his mother having died while he was a little child, he was educated and cared for by his aunt with the tenderness of a mother. He early evinced a fondness for languages, and actually mastered the Romany dialect, through the aid of gypsies whom he met and induced to talk with him in their peculiar tongue. For some three years he served as a junior clerk in a London house, during which time he acquired French and Italian, so as to speak them with the accuracy of a native. His conviction was, that any intelligent person can learn, by the natural method, as he called it, which children pursue, any language whatever, so as to read it in a few weeks, and speak it in a few months. This method he followed, viz., hearing and speaking different languages; he eschewed grammars, after the Greek and Latin manner; and his success was marvelous in the extreme.

Mr. Palmer entered St. John's College, Cambridge, and was graduated in 1867. Though not distinguished in other respects, while an undergraduate, he was nevertheless elected to a fellowship in his college, soon after graduation, on the score of his already remarkable attainments in Arabic, Persian, and Hindustani. These he had made through the help of two or three Orientals living at the time in Cambridge. When the Sinai Survey Expedition was sent out in 1868-'69 Mr. Palmer accompanied it, having in view the investigation of the nomenclature, traditions, and antiquities of Arabia Petræa. One of the results of this expedition was the discovery of the route taken by the escaped children of Israel in their journey from the Red Sea, and it was shown that this route led to a mountain in all respects answering to the mountain in which the law was given. Mr. Palmer also collected the curious Arabic and Mohammedan legends and traditions on the subject. The next year, 1869-'70, in company with Mr. O. F. Drake, he explored the Desert of the Wanderings (El Teh), and succeeded in fixing many of the localities where the Israelites rested, such as Kibroth-Hattaavah, besides making other valuable discoveries. He also made some stay in Jerusalem, and looked into the interesting question to all pilgrims as to the true site of the Holy Sepulchre. He gave his decision against the traditional site. On his return home he published "The Desert of the Exodus: Journeys on Foot in the Wilderness of the Forty Years' Wanderings" (1871).

In November, 1871, Mr. Palmer was appointed the lord almoner's Professor of Arabic in the University of Cambridge, which place

he held for ten years. Finding his work there not altogether congenial, and his income only moderate, Prof. Palmer, in 1881, transferred his residence to London. He entered largely into journalistic and literary pursuits, at the same time carrying forward his Oriental studies with unremitting assiduity. He was widely consulted on questions that related to the East, and his vast learning, for a man of his years, was made to subserve the interests of justice and truth. His publications, beginning, in 1865, with a translation into Arabic verse of Moore's "Paradise and the Peri," extended on from year to year to the close of his life. He produced an Arabic grammar, a Persian dictionary, the "Life of the Caliph Haroun al-Raschid," and edited and revised Henry Martyn's Persian translation of the New Testament. He furnished a report on the "Nomenclature of Sinai"; a report on the "Bedouins of Sinai and their Traditions"; and an account of the "Negeb, or South Country of Holy Scripture." He translated "The Song of the Reed," mainly from the Persian and Arabic, and brought out an edition and translation into English verse of the Arabic lyric poet, Beha Ed-din Zohair. He also published a volume of Gypsy-English poems, in conjunction with Charles Godfrey Leland; and translated into English verse, with the collaboration of Magnusson, the lyrical poems of Runeberg, the great Swedish poet. Besides all these, he produced various essays, poems, and letters in Urdu and Persian, which appeared in the native papers in India.

In the summer of 1882 Prof. Palmer acceded to the request of the Government, and set out on a mission which ended so disastrously to himself. He was commissioned to visit the Arab sheiks of the Sinai Desert; to expend, if needful, £20,000, in order to secure their neutrality along the line of the Suez Canal; and to win them, if possible, from joining Arabi Bey in a fanatical and so-called holy war against the English. He entered upon his mission with entire courage and confidence. He penetrated the wilderness, accompanied by only two attendants, and trusted for safety to his former friendly relations with the Bedouin tribes, and his intimate knowledge of their language and peculiarities. After some weeks spent in negotiation, he gained success in the work he had undertaken; but as he was returning to Suez to redeem the promises made to the chiefs of pecuniary aid, he was treacherously betrayed into the hands of a party of Bedouin robbers; he and his two companions were taken prisoners, and after a few days' captivity the three were murdered.

In view of the services which he might yet have rendered to Oriental literature, it was a great and grievous loss. He was in the very prime of life, with a brilliant future before him; a man of varied and marvelous gifts, and one who secured the esteem and affection of all who knew him. The life of the "Sheik Ab-

dullah" (as was his Oriental title) was written by his friend and to some extent fellow-worker, Walter Besant, M. A. It is an interesting volume (published early in 1888), and gives not only the story of his life, but also copious extracts from his publications in Arabic and Persian. It has also a portrait of the professor, in Oriental costume.

PAPER-HANGINGS AND WALL-PAPER. This industry has made greater advances within the past ten years than almost any other of our older manufactures. Thirty to fifty years ago the only wall-papers made in this country were of the cheapest and poorest quality. Printed on an unsized brown paper, from wooden blocks which did not match well, with stiff and ungainly designs, in not more than three or four colors, and with combinations as absurd and impossible as could be conceived, they were only tolerated by the poor as a substitute for whitewash. All the better class of wall-papers were imported, and these, though greatly superior to the domestic papers, were then mostly of patterns which would not now be considered desirable. There was some progress as the tastes of the population improved, and better stock and somewhat better designs were introduced; but though the register was better, the old hand-printing with blocks was still practiced, and even the best patterns had a stiff, unnatural, wooden appearance. A few of our manufacturers were beginning to desire something better, and this led to many experiments; but most of these were mere gropings in the dark, without any clear comprehension of what was actually wanted. Gilding had been introduced, though it was not skillfully applied; and, with that perversity which possesses some manufacturers, no sooner was it found that there was a demand for gilt papers, than some of the makers began to use the Dutch gilding in place of gold-leaf, and the tarnished figures soon disgusted purchasers. Even in 1860 the wall-paper industry did not flourish. There were, according to the census of that year, 26 establishments making wall-papers in the entire country; they employed 1,294 hands (the printing was generally done by hand); there was invested in the business, \$1,087,600 of capital (about \$40,000 to each factory); and they produced goods valued at \$2,148,800, about an average of \$80,000 to each establishment. There were more of the higher priced papers made than ten years before, but the cheap and ugly patterns were still in the ascendant. At that time we were importing nearly \$2,000,000 worth of paper-hangings. The war brought with it some changes in this as in many other things. Foreign goods were not so readily obtained, and our manufacturers had awakened to the necessity of making better and more tasteful goods if they would gain and hold the market. Machine-printing was introduced, and better designs furnished, though as yet the foreign patterns were slavishly copied. The cen-

sus of 1870, perhaps to a greater degree than its predecessors, was defective and almost worthless in its manufacturing statistics. It represented the number of establishments in the whole country as but 19, employing only 869 hands, using \$1,415,500 capital, and producing goods of the value of \$2,165,510. This was not in any material respect an advance on the report of 1860; but the importation of paper-hangings had fallen off to a specie value of about \$600,000, equivalent to a currency value of at least \$1,000,000. Here was a gain, for there could be no doubt that our manufactures of wall-paper reached \$2,500,000, or two and a half times the value of the import.

About this time there was a sudden and remarkable improvement in the English wall-papers, which was initiated by William Morris and his friend W. M. Rossetti, both poets and artists. The designs of Morris were at first (in 1863) confined to furniture and decorations of dwellings, in which he manifested great artistic ability and originality. He soon proceeded from this to designs for wall-papers, which, though they at first excited much opposition from their startling character, soon became popular, and after a time the English manufacturers surpassed the French in the beauty of their designs. These goods, a little later, were imported here in very considerable quantities; and in 1873 or 1874 leading manufacturers began to compete with them. In the Centennial Exposition, the display of both English and French paper-hangings was of very great beauty, but one or two of our American manufacturers ventured to compete with them, and acquitted themselves creditably.

From that time the progress of the American wall-paper manufacture has been exceedingly rapid. Processes of cylinder-printing have been invented and improved, by which it is possible to print papers in a greater variety of colors, and with greater accuracy and perfection, than is done by any of the European manufacturers. At first, our manufacturers copied, with some changes, the European designs, but now the largest have encouraged native talent, and find that the designs received from our own artists, many of them trained solely in American art-schools, are more tasteful and elegant than the best of the foreign designs.

The result of these improvements, which raised the production of decorative wall-papers to a high rank among the fine arts, has been such an increase of production as has hardly been witnessed in any other industry in the same period. The census statistics of 1880 were remarkably accurate for that time, as the number of manufacturers was not large, and they were associated and made their quarterly reports. They were as follow: Number of establishments, 25; capital, \$3,560,500; number of hands, 2,487; wages paid, \$874,921; material used, \$3,629,222; amount of annual product, \$6,267,303, or double the whole production and importation of 1870. Meanwhile

the importation had fallen off to \$100,134 in 1877, and \$130,948 in 1880. Five sixths in value of these manufactured goods were made in the State of New York.

But, rapid as was the growth of this industry between 1870 and 1880, it has been greatly accelerated since 1880. The whole number of establishments is now 27—one having been added in Brooklyn, one in Elizabeth, and one in Buffalo; but one has failed. The cities of Brooklyn and New York produce five sixths in value, and more than four fifths in quantity, of the total production of the United States. The entire production in the United States is very nearly of the value of \$12,000,000, although prices have been materially reduced. Of this amount a little more than \$6,000,000 are produced in New York city, an increase of more than \$2,500,000 since 1880; and \$3,995,000 in Brooklyn, about three times the amount reported in the census of 1880. The import is still insignificant—only about \$150,000 in 1883, and this including glazed and fancy papers—while our manufacturers are exporting their papers to Canada and Australia.

Under the general title of paper-hangings are included four distinct classes of goods, viz.: 1. Wall-papers proper, which are put up in pieces or rolls of eight yards each, and with which are also reckoned borders of various widths, also in pieces of eight yards. 2. Dadoes and hall fresco-papers, of varying widths and lengths. 3. Ceiling-papers, also of various sizes, and usually with borders; these are of elaborate designs, and represent with great fidelity the finest fresco-paintings. 4. Window-curtains, of various widths, and either plain or bordered. These four classes of goods are not all manufactured by any one house, but the largest make two or three of them. The largest of the Brooklyn houses manufactures wall-papers and borders, and curtains; the largest New York house, and one of the great Brooklyn houses, make wall-papers and borders, dadoes, hall-frescoes, and ceiling-papers.

The paper used is not, so far as we can learn, manufactured by the paper-hanging houses themselves. The greater part of it comes from Massachusetts and Connecticut, and Washington, Essex, and Rensselaer counties of New York. There is one paper-mill for these papers in Kings county, producing about four tons a day, which is but a small portion of the amount used in that county. The paper is made mostly from old newspaper stock, though the fresco and ceiling papers are usually of better and heavier materials. For wall-papers, they are generally furnished in rolls of about 100 pounds, the width of the paper being about twenty inches; for fresco and ceiling papers the sizes vary. The curtain-paper is from five to eight feet in width, and of heavy stock.

Most of the better class of papers are now satined, i. e., coated with a surface of very fine clay, tinted of any color required, and applied by passing the paper between rollers and pol-

ishing it by means of a swiftly-revolving brush, which gives it the satin finish desired. When thoroughly dried and hardened, it is reeled up and is ready for the printing. This is effected by a process somewhat similar to that now employed in calico-printing, except that the colors are oil-colors, and there are as many cylinders as there are colors to be used, and each cylinder has its reservoir of its own color, and its rollers for distributing the color evenly over its printing surface. If there is to be gilding, one cylinder is charged with size, and the gold-leaf is applied subsequently. As the newly-printed wall-paper passes off from the printing-machine in continuous lengths of 800 to 1,000 feet, it is, by an ingenious contrivance, made to pass over laths or wands, which it carries forward up an inclined plane till they fall into a slot at the top of a frame, and the paper is hung in folds or loops of sixteen or eighteen feet in length, and is thus thoroughly dried. These frames close up on each other with a space of perhaps four inches between them. When the paper is dried, it is passed along an inclined plane automatically, carefully inspected, and at the lower end of the inclined plane rolled up and cut off, by a guillotine-knife, in lengths of eight yards, the regulation length of a roll, and is ready to be packed for market, or sorted, each pattern by itself, for the storehouses. One manufacturer in Brooklyn, whose establishment is said to be the largest in the United States, and perhaps in the world, turns out 9,000,000 of these rolls annually. The fresco and ceiling papers are printed by a different process, somewhat analogous to the best color-printing from types and electrotypes. The designs are engraved on blocks and electrotyped, and there are as many printings as there are colors, the machinery being so constructed as to produce the most perfect register.

The design or pattern is first carefully drawn and colored by the artist, as it is to appear on the paper. The artist then makes as many copies of the drawing as there are to be colors on tracing-cloth, and by colored chalks traces that part of the pattern which is to be of a particular color upon each sheet. Cylinders of apple-wood, beech, or cherry are now provided, each of exactly the same size, and turned smooth in a lathe. The sheets of tracing-cloth, all of precisely the same size and covering the cylinder exactly, are then put on the cylinders with a peculiar cement, and are handed over to the men who are to put in the figures or designs of each color. Every man has his own color, and never takes any other. The figures of the design are now worked out by inserting in the colored lines slips of hardened brass rule, which by bending and filing are brought to the shape of the figure, and, a slight incision being made in the cylinder, they are driven in by a single tap of a light hammer. The figure must be copied with the most absolute exactness; a variation of a hair's-breadth might spoil the pattern. When it is completed, the interstices of

the figure are filled in with a dense and firm felt nearly to the surface. The rolls are next to be tested; a lathe is fitted up with a gauge, carefully adjusted, and the slightest inequality is carefully turned off. They are next interlocked to make sure of a perfect register. The colors are all mixed in the factory, and for the finer qualities aniline colors are largely used.

The window-curtains are usually of one or two colors. They are printed on an immense cylinder wheel, whose diameter is 11 or 12 feet.

The patterns of one year are not, except in very rare instances, repeated the following year, but an entirely new set is designed for each year's sales. For each year a number of rolls, slightly in excess of the supposed demand, are printed, and where there are remainders they are worked off the following year; but the manufacturers will not pledge themselves to supply a pattern more than two years old, and very often they can not furnish one which was made the year before. This industry affords employment, at good wages, to a large number of young artists and designers, and is doing as much as any industry, except perhaps calico-printing and book-engraving, to promote the more intimate connection between the fine and the useful arts.

Within the past year there has been put upon the market a new decorative material of great promise, to which the name of "Lincrusta-Walton" has been given. Its composition is secret, but it is known that solidified oil enters largely into it. The material is said to be soft at first, and to allow the imitations of the most delicate outlines, and the raising of the ornamentation considerably above the ground work; but it soon hardens without becoming brittle, and is not affected by either water or temperature. Panels representing statues in bronze are made from it, and the fine wood-carvings of the old cathedrals are imitated to perfection. This new invention has been introduced simultaneously into France, England, and America.

PARAGUAY, a republic of South America. To the general statements of area and territorial divisions, given in former volumes, and of population given in Volume VII, it may be here added that the principal cities are Asuncion, the capital, with a population of 16,000; Villa Rica, with 12,570; Villa Concepcion, 10,697; Villa San Pedro, 9,706; Luque, 8,878; San Estanislao, 7,458; Itangua, 6,948; Ita, 6,382; Paraguari, 5,315; Villa Humaitá, 3,868; Villa Pilar, 3,722; and Jaguaron, 3,418.

Government.—The President is Gen. B. Caballero (since Nov. 25, 1882). The Cabinet is composed of the following ministers: Secretary of the Interior, Col. Mesa; Foreign Affairs, J. S. Decond; Finance, J. C. Jimenez; Justice and Public Worship, Señor Gonzalez; War, Col. Duarte.

Army and Navy.—No citizen of Paraguay is exempt from military service; but the standing army has been reduced to 500 men (350 foot and 150 horse), a portion thereof keeping gar-

rison at Asuncion, and the rest doing frontier service. In case of war, the National Guard is enrolled. The country has a chief of police in each of the seventy departments. The navy consists of a screw steam man-of-war of 440 tons, mounting 4 guns, and having a crew of 36 sailors, commanded by 4 officers, besides 3 small steamers doing service in the ports.

Finance.—The chief source of revenue is the customs, which in 1881 produced \$426,940, and adding thereto other items of income the total amount collected was set at \$542,000. For the year 1883 the budget estimated the aggregate outlay at \$352,968.

Public Indebtedness.—By virtue of the treaties of peace which terminated the war, and finally the still pending differences between Paraguay and the individual belligerents that had formed the alliance against her, she obliged herself to refund the cost of the war, and indemnify those who suffered by the Lopez invasion of Brazilian, Argentine, and Uruguayan territory. By a separate treaty one of the parties to the former alliance, Uruguay, waived these latter claims of indemnity on April 20, 1883. The precise cost of the war has never been estimated, but those who suffered from the invasion have formulated their claims, and Paraguay has recognized their validity, constituting Brazilian and Argentine claims to the amount of several million dollars still pending.

The internal debt, by the sale of national property, that of the railroad, and through the operations of a sinking fund created by an extra duty of 10 per cent., has been reduced to \$642,667. The foreign debt amounted, on Jan. 1, 1882, to \$16,818,412.

General Condition of the Country.—Congress reopened its sessions April 1, 1883, on which occasion the President in his message alluded to the improved state of affairs, the cessation of the financial crisis, the progress made by public instruction, the rapid increase of flocks of sheep, and the remarkable headway which agriculture had made. Advices dated in December, 1883, show that the year had been generally prosperous; but a country the bulk of whose male population perished during the gigantic and prolonged struggle against a powerful alliance of neighbors requires time to replace itself on a flourishing moral and material basis, and a large immigration of agriculturists to fill up the gap left by the war.

The practical and liberal measures of the present administration have already done much toward obliterating the evil results of the government with which the country was afflicted during the successive sway of a Francia, Rosas, and Lopez. The financial difficulties hampering it in this endeavor are great, and foreign capital is slow in coming thither. Fortunately, the Government is the chief owner of the arable land in the republic, and has therefore the means of holding out inducements to agriculturists from abroad. Strenuous efforts have, therefore, been made to foster immigration,

especially from Germany, and not without success. A dispatch from London, Jan. 11, 1884, said: "The movement in Germany for the establishment of working-men's colonies is making rapid headway. Committees of emigration from different parts of the country recently came together at Frankfort, and resolved to push the matter of sending more German workmen to Paraguay, where a colony had already been established." For several years past the Geographical Society of Leipsic has labored in the same direction, and forwarded colonists to Paraguay. Since, in 1882, some Germans and Englishmen became purchasers of tracts of arable lands in Paraguay, similar property has risen 50 per cent. in 1883. But even at this advance, *estancias*, well watered, wooded, and provided with fine pasturages, could still be bought in 1883 for \$800 to \$1,000 the square league. There are probably few countries possessing the resources and climate of Paraguay, of easy access to immigration, where, with such a moderate outlay, similar tracts of land can be acquired by the *bona fide* settler.

Communications.—The only railway in operation is the one from Asuncion to Paraguari, forty-five miles, which in 1881 forwarded 81,807 passengers. In the same year its gross earnings were \$61,207. There is but one telegraph line in operation, running parallel with the railway aforementioned. The items of mail matter forwarded were as follow:

	1880.	1881.
Inland.....	20,796	84,117
Received from abroad...	80,860	47,134
Sent abroad.....	15,679	48,863
Total.....	67,335	180,113

Amount of postage collected in 1881, \$2,227.

Commerce.—The commercial movements in two years were as follow:

	Import.	Export.	Amount of duty collected.
1880.....	\$1,080,000	\$1,163,000	\$320,000
1881.....	1,390,000	1,929,000	427,000

The chief articles of import in 1881 were: cotton goods, \$269,264 worth; beverages, \$167,114; hardware, \$119,484; woollens, \$77,351; and the remainder was made up of flour, boots and shoes, sugar, rice, coal, petroleum, bagging, etc. The exports consisted of *yerba mate*, or Paraguay tea, \$910,126; leaf-tobacco and cigars, \$682,666; hides and skins, \$116,782; oranges, \$47,948; the rest being cabinet and dye woods, essence of orange-blossoms, tanning-bark, Indian corn, leather, etc.

PATENTS. A United States patent for an invention is a grant, given by the Government, of the exclusive right to use, make, or sell any subject of invention that has been first invented by the applicant himself, not abandoned, nor in public use. It is granted for a period of seventeen years, and can not be extended. The word "patent" means open. A patent struc-

ure is one whose construction and uses are disclosed to the public. This contradicts to a certain extent the popular idea, which fails to realize that the subject of a patent is the property of the public, withheld from it by special grant for the period of the patent. When a person has invented a machine or other thing, he has two ways of securing to himself its exclusive use. One is to keep it a secret, the other is to patent it, which implies to publish it. To secure patent rights in it, an accurate description, accompanied, it may be, with drawings and model, has to be filed in the Patent-Office at Washington. As soon as the patent is granted, this description is patent or open to public inspection. The text and drawing, if any, are reproduced in printing and lithography, and kept on sale to all applicants.

An unpatented invention can be used by any one who finds out its secret. The law recognizes no right of property in an invention until it is patented. The material development of the country is consulted when it is enacted that all inventions shall be the property of the public, sooner or later, if divulged by patenting or otherwise. As a basis of right to any property, the thing must be defined by registry or otherwise. Finally, the law recognizes no intrinsic right of property in the intangible effort of the brain, which it holds to constitute the germ of invention. It refuses to recognize any right of property in invention as such, and holds that the inventor, when others have used his idea, is no poorer, and hence has not been robbed. Hence a special grant is necessary to protect him. A reciprocal rewarding and encouragement of inventors is presented in the consideration awarded for the disclosure of inventions. This consideration is the monopoly of his invention for a period of seventeen years. The nominal fees charged in this country for patents are only designed to cover the expenses of the Patent-Office.

Soliciting.—Patent soliciting should be performed by one familiar with the practice of the Patent-Office, an intimate acquaintance with which can only be obtained by experience. To this should be joined a knowledge of the views taken by the courts in these "metaphysics of the law," as Judge Story designated patent law. A patent may be drawn up so as to be accepted by the Patent-Office, and be utterly valueless in litigation. This court interpretation of patents is of greater extent and runs into more refinement than does the Patent-Office practice. A strong feeling now prevails that the law should exercise some choice or licensing of patent solicitors. Just as the practice of law in the courts is restricted to lawyers, approved members of the bar, so, it is argued, should the soliciting of patents, as far as attorneys are concerned, be confined to those recognized as capable after due examination by some designated examiners.

In the early days of the office but few patents were taken out. The practices of the depart-

ment were simpler and more elastic than at present. After a few years the causes began to come into court, and then the judges had to settle the legal status of the different cases. During the past ten years the Circuit Courts and the Supreme Court of the United States have had to decide in a vast number of patent suits. The statute has been read and re-read, and its provisions have been interpreted with the greatest refinement. The courts are the final and supreme arbiters of patents, and on the decisions of judges rest their value. Hence, to know what the power of a patent really is, the records of the courts must be consulted. The patent practice of to-day is far different from that of a few years ago. The new decisions of the courts alluded to above are not all that have modified it. The practice of the Patent-Office has become stricter, and the conditions of acceptability are more rigorous.

Patentability.—When an inventor has invented or discovered something, the last question that will probably occur to him is, Is it patentable? He is inclined to take this for granted; yet in all patent law no question is more intricate. The words "invented or discovered" occur in the statute, and the two words are held to be synonymous. "Any new and useful art, machine, manufacture, or composition of matter, or any new and useful improvement thereof, not known or used by others in this country," is the definition of patentable things.

Human Contrivance.—The first element which will be seen to run through the four patentable things is the element of human contrivance or devising. The law only grants patents to the products of the human brain. It does not patent natural forces. Newton is spoken of as the discoverer of gravitation. If on investigation he were found to be such, the law would be morally as well as physically incapable of granting him a patent for his discovery. Volta and Galvani were the discoverers of dynamic electricity. To-day we all see the *rôle* played by this force in human affairs. Had they lived to-day and made the discovery, they could not have patented it. For, though they discovered it, they did not do so in the sense of the word as used in the statute—they did not *invent* it. The force itself was no product of their brain; it existed from the beginning of time, and all they did was to discover means of localizing, developing, and identifying it. The patentable discovery would be limited to some form of galvanic or voltaic battery. The patentability of such a thing depends on whether it is a work of man or of Nature. In the latter case, it is the property of humanity at large, and can not be secured. Morse tried to patent the use of electricity for marking or printing at a distance. This amounted to claiming a monopoly of one of the laws of Nature. He had harnessed the lightning, and made it his messenger; but he tried to patent the messenger instead of the harness. His particular machine could have been secured as the work of man.

His case came into court, and was lost on the ground of too great extent of claim. This patent had gone safely through the office, to be declared invalid by the higher powers.

Originality.—Referred to the person applying for a patent, the thing must be his invention. The inventor must have invented it personally, and must make an oath to that effect. It often happens that the inventor has been preceded by another, and that he is a second or third inventor only. The Patent-Office is obliged, if the other conditions be fulfilled, to grant the patent to the first inventor. If it by accident grants the patent to the second inventor, the first has his remedy in interference proceedings.

Novelty.—The originality of the invention being settled, it has next to be considered, unless it is totally original, whether there is a sufficient change from existing structures or processes. The majority of inventions at this time consist in such changes. The question to be determined is whether these changes were obvious, or whether they required invention for their development. When nothing more than the ordinary knowledge or skill of one conversant with the art was required, there is no invention. Some of these changes are so ingenious and beneficial in their results as to be true inventions, however clearly changes. The best authority is good common sense applied by a qualified and disinterested person. The inventor is almost certain to take too favorable a view of the change he has effected.

Double Use.—Double use of an existing structure or other invention, if accompanied by ever so slight a change, may be patentable. The office will be found rather strict in dealing with this class of subjects. The general rule in the case of a machine is that it, with all its possible functions, is the property of the inventor. A grindstone invented for the purpose of grinding needles, would be protected for grinding pins. But where the use contemplated in the original patent was widely different from the use discovered by a new inventor, but little will be required to constitute an invention.

As an illustration of Patent-Office practice, some of its decisions may be quoted. It has declared unpatentable the following devices: Applying to a paddle-wheel vessel a device borrowed from a land-vehicle; doing the same with reference to a wind-mill and paddle-wheel; preserving fruits by a process already used for eggs; using the sand-blast for cleaning iron. The subject of double use is extensive. The courts and the Patent-Office proceed very differently here. The former give the patentee the benefit of the doubt; the office does the reverse. As a practical rule, where the question of double use is in issue, if a patent passes the office, it will be safe in the courts. The courts have for their assistance the knowledge of the results achieved by the patented article. If anything in the nature of an industrial revolution has been accomplished, it tends to prove that invention has been exerted. This

refers to change of existing structures, as well as double use. The consideration of results achieved affects both. The office has to take a more abstract view of the subject, knowledge of results not being ordinarily at its disposal. If a functional change in a machine has been produced, it is invention; if only a structural one, invention is probably absent. Novelty is one of the statutory characters of patentable things, and it is affected by several sharply defined considerations of prior use and publication. The pioneers in invention have always the best chance in this matter.

Prior Use.—An invention will not be new if it has been in use in this country before its invention by the patentee was completed. An inventor may have honestly worked at his conception, and completed a perfect invention, only to find that the same thing has been done before, and that his device was in use in this country long before he thought of it. For this there is no remedy; his invention is unpatentable. Prior use must have certain characteristics, to make it efficient in destroying patentability. It must be public, no matter in how limited a sense. Private use has been decided to be ineffectual. A patentee is required to have a *quid pro quo* to exchange for his patent-right. He must make a gift to the public of something they were not already possessed of.

The anticipating structure, to come under prior use, must be a complete realization of the subject of the invention, and must have been successful in its operation. An abandoned experiment will not answer. A general resemblance of an inoperative structure will not answer, reduction to practice being essential.

Prior use abroad does not affect the inventor. The theory is, that the public in this country have no knowledge of the customs of other countries, as far as mere rumor or verbal report is concerned. This theory is recognized in the wording of the statute, where prior use is limited to prior use in this country.

Publication.—Publication affects patentability differently. If a description of the invention has been published in printed form, here or abroad, before the date of invention, an anticipation is proved. No exception is made in the case of foreign publications, as printed matter is supposed to travel everywhere. It must be a genuine publication. Rejected applications for patents are held to afford no instances of prior publication, if descriptions of inventions are found in them.

Combinations.—Within the past few years, new and very important rulings have been introduced in the Patent-Office on the question of combination, and the practice has become extremely stringent in this regard. All the parts of a patent must co-operate to the end, in the strictest possible manner. An aggregation or mere collection of parts will be held to be unpatentable. Like a perfect drama, the invention must have its unities. Every part of the combination that is specified in the

claim must play a part in the operation of the machine. This refers to the claim for combination. When it comes to the claims for parts, no part can be individually claimed outside of the combination, unless it is strictly essential to the working of the device. Thus, an automatic regulator working a steam-valve may be the subject of a patent for the combination. If the regulator is a separate structure, actuating or working a newly invented valve, and adaptable to other valves, the valve could not, as a separate device, be claimed in the same patent with that for the combination. Two or more patents should be taken out, one for the combination and one for the valve, and one for each other individual and replaceable element of the combination. When a patent for a combination comes before it, the office first examines into the mutual dependence of the elements of the combination. If these parts do not in the strictest sense work together, or co-operate for the same end, if they can be separated into two or more distinct and individually operative devices, which will work independently, the examiner will do it, and refuse a single patent for a supposed combination, which is really an aggregation. If the combination is allowed, and an attempt is made to claim individually different elements as having some peculiarities of structure, additional patents will be demanded for these, if known equivalents can be substituted for them in the combination. The decisions of the Supreme Court on reissues are the most important judicial decisions of the past few years; so in office practice the rulings on combinations constitute the most important of recent changes.

Interference.—The person to whom the patent is granted must, as far as the office knows, be the original inventor. If a patent has been granted to one who is a second or third inventor, the first inventor can claim his patent in the face of the preceding grant, provided the prior use and publication conditions are good. This constitutes one of the phases of interference. An interference between two or more inventors means a proceeding instituted on account of a conflict of claims to being the first inventor of any specific device. There are eight such cases of conflict: 1. Between two or more original applications. 2. Between an original application and an unexpired patent. 3. Between an original application and an application for reissue of a patent granted during pendency of such application. 4. Between an original application and an application for reissue of a preceding patent. 5. Between two or more applications for reissue of patents granted on applications pending at the same time. 6. Between two or more applications for reissue of patents granted on applications not pending at the same time. 7. Between a reissue application and an unexpired patent, whose original applications were pending at the same time. 8. Between an application for reissue of a later unexpired patent,

and an earlier unexpired patent granted before the original application of the later patent was filed. In cases 2, 4, 6, 7, and 8, affidavits must be filed by the party latest in date of application, either original or reissue, such affidavit declaring that he is the original inventor. Interferences in the above-named cases will be declared by the Patent-Office. Before declaration, all the preliminary work necessary to put the new applications in shape for granting the application must be completed, so that when the interference is decided, the new patent, if it wins, shall be ready for issue.

As we are now treating of a proceeding in the Patent-Office, the staff of the office may be mentioned. Its head is the Commissioner of Patents. All communications relating to the office should be addressed to him under that title. The working force to whom the examination of applications for patents is intrusted, are called primary examiners. Between these two ranks there is a Board of Examiners, who hear appeals from the decisions of the primary examiners. An examiner of interferences completes the list.

The interference proceedings are conducted before the examiner of interferences. The issue between the parties must, before declaration of interference, be clearly defined by the primary examiner to the satisfaction of himself and the examiner of interferences. In case of disagreement, reference is made to the commissioner for decision. Until declaration of interference has been made, the primary examiner retains jurisdiction of the case; afterward it passes to the examiner of interferences. The interference is *pro forma* instituted and declared by forwarding the notices to the several parties to the interference, or to their attorneys, or assignees. If two parties are represented by the same attorney, notice will be sent to each of them, as well as to their attorney. The proceedings will then begin. The rules will be found in the "Rules of Practice of the United States Patent-Office," rules 92-127. The exact procedure need not be detailed here. The rules to be observed are as strict as those of the regular law courts, and the whole proceedings are based upon a system analogous to court practice. When an interference is decided, the party making application is given a patent, if he wins. Thus a very peculiar condition of things may arise in cases where the interference is between a patent already granted and a new application for the same invention. The Commissioner of Patents has no right to cancel a patent already granted, so that two patents may be in the field, one several years later in date than the other, yet the later one will be held the prevailing and valid patent. Sometimes these proceedings give rise to what may be termed hardships. Two inventors may go into interference, and one of them, during the time of the proceedings, which are often prolonged, may manufacture and make a profit out of

the article, before the office can decide who is the rightful inventor. Thus a person not the first inventor, and not destined to have the patent, may use the patent for some time. The great thing in interference proceedings is, to file a correct and sufficiently comprehensive yet concise preliminary statement. In subsequent taking of proofs the parties will be held to the dates set up in these statements, and will not be allowed to contradict their allegations. Different motions to amend are admitted, and the case goes on like a suit in the courts. In determining the date of invention, diligence in perfecting the invention is taken into account. Mere conception is held to be only a part of the act of invention. A case has arisen between two inventors where the one who made the later conception was the earliest to perfect it, and after this took out his patent later than the other; the other first conceived the idea, first patented it, and then went to work to perfect it as a practical device, and only succeeded in so doing after the date of his rival's patent. The first one described above was held to be the inventor. Diligence is esteemed a public service deserving recognition; and in many cases the practical work of perfecting is a part of the invention. As it is important to be prepared for interference proceedings, inventors should be careful to preserve records of the process of invention. Signed and witnessed sketches, attested as to date, and similarly guaranteed models, are usually the best evidence. There should never be any trouble in obtaining trustworthy and confidential witnesses to these.

Utility.—In the statute the word "useful" is used to qualify the subject of invention. All that can be said of this is, that the word is interpreted in the broadest possible sense, and that anything not opposed to good morals, or similarly injurious, is patentable, as far as its utility is concerned. The only case where the question of utility amounts to anything is where extent of invention under change of existing structures, or under double use, has to be ascertained. There extent of utility may be considered by the courts in determining whether invention has been exercised. Except in this particular case, the patentee has only himself to satisfy of the utility of an invention. Patentability is not affected directly by it.

Public Use.—An invention that has been in public use for more than two years prior to the date of application can not be patented. One may be the first inventor of a thing, and may introduce it into public use before applying for a patent. If he allows two years to elapse, it will be too late for him to secure his invention. If a patent is granted under such circumstances, the office not having cognizance of the public use in question, and subsequently comes into court, proof of such use will render it invalid. Another inducement to diligence is drawn from this. An inventor can not be sure that his invention will not escape him and go

into public use unknown to him, and for the two years required to bar his patent. Still, the circuit courts have held that the inventor's knowledge and consent were necessary to constitute the statutory public use. Public use must occur in this country, to bar patentability. It must be a use in public; but the public need not be the users. Experiments do not constitute it. A great criterion, and one easily applied, is whether it has been used for profit, or been sold. Such use is generally fatal to it.

Abandonment.—Abandonment of an invention to the public destroys patentability. The theory is, that such inventions may be taken up by the public, and pushed to a successful result. In this case an injustice would be done in awarding the monopoly to one who had thrown his invention aside, to be developed by the labor and time of others. As the statute expressly allows two years' public use before the filing of the application, cases of abandonment generally refer to negligence in prosecuting an application already filed. It is a matter of fact, sometimes hard to prove, as the intention of the patentee has often to be inferred. To constitute abandonment, the public must know of it. Those seeking to prove abandonment have to bear the burden of proof, and such proof must be very clear.

Reissues.—The decisions given in the past two years on the subject of reissues have effected an immense change in the status of this class of patents. A reissue is a second patent granted to cover defects arising from errors in the original specification. An inventor feeling that his original specification contains errors due to inadvertence, may surrender it, and apply at the same time for a new patent, with amended specification and claims. If such be granted him, the old patent is void, of course, as being surrendered, while the reissue bears its own date of issue, and is granted for the unexpired term of the original patent. Formerly extensive changes in the specification were admitted, and expansion of claims also. Any time might elapse between the granting of a patent and the granting of a reissue. The new rulings of the courts have made the rights of reissued patents much more limited. They must be taken out soon after the original patent, without unreasonable delay, if any attempt is to be made to broaden the claims. As a rule, the claims can not be at all expanded. The inserting of claims of fewer elements is held to be a broadening. The theory of establishment of adverse rights, and of abandonment to the public of unclaimed portions of the invention, are the key-notes of these decisions. No new invention can, on any account, be permitted in a reissue, even if it is contained in what seems to be a narrower claim. The effect of this decision has been to invalidate a great many old reissues, and to reduce the number of reissues sought. The best general rule is, to adhere to the original patent.

Extensions.—The subject of extension of pat-

ents has nearly dropped out of sight since 1875, when the last extension patents had necessarily run out (except perhaps design patents). Extensions are now granted only by special act of Congress.

Disclaimers.—Disclaimers are for the purpose of disclaiming any excess of claims. Where more has been claimed than was invented, the patent may have to be rendered correct and valid by such process. They are rarely filed, except under advice of an attorney.

Drawings.—The office is much stricter on this subject than formerly. The drawings of patents have to be reproduced and diminished by some photo-printing process, and a peculiar style of work adapted for this is exacted. Drawings should be on three-sheet Bristol board, 10 × 15 inches in size. One inch from its edges a single marginal line is drawn, leaving the "sight" precisely 8 × 13 inches. All work and signatures must be included within this line. One of the short sides is regarded as the top, and a space of not less than 1½ inch is to be left blank for the heading of title, etc. All this heading is done by the office. The title of the drawing is written on its back in pencil. They must be rolled, not folded. They must be made in perfectly black India ink; no pale lines are admissible; rubbing out of pencil-lines, after the drawing is inked, frequently makes them so. In this case they must be gone over a second time. No rough lines must be made. Finally, the lines must be of a certain thickness, as hair-lines are not reproduced well. The lettering must be good; drawings are sometimes rejected for bad lettering. The Patent-Office rules for drawings are found in the "Rules of Practice."

Models.—No models are now required, except in special cases. This refers to practice, as the commissioner has the right to insist on their production. They must be neatly made, and not exceed 12 inches in any dimension.

Rules of Practice.—These are contained in a pamphlet entitled "Rules of Practice of the United States Patent-Office." Any one can procure a copy free by writing to the Commissioner of Patents, Washington, D. C. A specimen drawing, specification, and claims will be found in this pamphlet, together with all the rules, some two hundred, that guide the office in its work. From time to time new editions are published, and amendments to the rules are also published in the "Patent-Office Gazette."

Caveats.—It may happen that an inventor, having partially completed an invention, is afraid that some one will invent and apply for a patent for the same device before he is ready with his application. In such a case, he should take out a caveat. This is a description of his invention as perfect as the state of his work will admit. It should include a drawing made on thin paper or tracing-cloth that will admit of folding. It is filed at the Patent-Office, and for one year entitles him to notification if any one applies for a patent for the same subject.

After the receiving of such notification, he has three months in which to prepare his specification, the other one not being taken up until the expiration of that period. The three months begin at the expiration of the time regularly required for the transmission of the notice by mail from Washington to the caveator's address. Thus a caveat affords no protection whatever. Prospective patentees often have a tendency to caveat their inventions. They should be clearly informed that a caveat is no protection to their invention, and gives them no standing in the court. As it tends to retard, indirectly, the efforts of the inventor, and thereby places him at a disadvantage in the race for diligence, it is generally not to be advised. Any citizen, or alien of a year's residence, who has declared his intentions, can file a caveat. Any one can take out a patent. A caveat can be renewed from year to year, for any period.

Design-Patents.—Patents for designs are granted for terms of three and a half years, or for seven years, or for fourteen years. Specification and drawing, engraving, or photograph, or model is required. The order of the subjects of the text should be as follows: 1. Name and residence of the applicant, title of the design, and name of the article. 2. Detailed description of the design as shown in the drawing, engraving, or photograph, with reference to designating letters. 3. Claim or claims. 4. Signature of the inventor. 5. Signature of two witnesses. Sometimes a design-patent may be made to take the place of a regular mechanical patent. The drawings should be on Bristol board, 10 × 15 inches in size, signed and witnessed. Photographs or engravings, if used, should be mounted on such paper. Unmounted copies of the photograph or engraving, if such be used, of a size not exceeding 7½ × 11 inches, are required by the office to the number of ten extra copies. If good drawings are furnished, the office reproduces them by photo-lithography.

Fees.—With regard to fees, a full list will be found printed in rule 209 of the "Rules of Practice." The principal ones are the following: On filing every application for a design-patent, \$10. On issuing the same for three years and six months, no extra charge. On issuing the same for seven years, \$5; for fourteen years, \$20. On filing every caveat, \$10. On every application for a patent for an invention or discovery, \$15. On issuing each original patent for an invention or discovery, \$20. The last charge must be paid within six months of the date of granting the application.

Change in English Patent Law.—We can not here say anything on the subject of foreign patents, except to note an important change in the English patent law. The payment for an English patent is now distributed over a series of years, by which the obtaining of one is made much less onerous. On application for a patent or for provisional protection, £4 is payable.

The patent is then subject to taxation as follows: £10 each fourth, fifth, sixth, and seventh year, and £15 each eighth and ninth year, £20 each tenth, eleventh, twelfth, and thirteenth year. Or £50 may be paid before the end of four years, or £100 before the end of eight years. By another change in the law, the patentee is required to swear that he is the original inventor. The first introducer can no longer patent an invention. The charge of American solicitors for procuring an English patent, including the Government fees, varies from \$100 to \$150.

Patent Libraries.—The best library for general use is the Astor Library of New York. Besides this the Peabody Library of Baltimore, the Boston Library, and the Library of Congress in Washington, may be mentioned. Others will be found in leading cities and universities.

Business of the Office in 1888.—The following are the principal statements of the business done in the Patent-Office in the year 1888:

Number of patents issued, including designs.....	22,216
Number of patents reissued.....	167
Number of patents expired during the year.....	8,674
Net receipts of office.....	\$1,146,240 00
Excess of receipts over expenditures.....	471,005 14
Balance to credit of office in United States Treasury.....	2,676,476 24

One patent was issued for every 818 inhabitants of the District of Columbia, and one patent for every 22,188 inhabitants of Mississippi. These represent the two extremes among the States of the Union. Among foreign countries, Bermuda, Brazil, Newfoundland, and Venezuela are credited with one patent each; England with 435, Germany with 235, and France with 179.

International Conference for the Protection of Patents.—A conference to establish an International Union, like the Postal Union, for the protection of patents, designs, models, trade-marks, and trade-names, met in Paris, March 6, 1883, and adjourned after adopting a draft of a convention at the second sitting, on March 18th. The main points were settled at the first conference held at Paris two years before. The convention then proposed was communicated by the French Government to the other participating states. Some of the particulars were objected to by several of the states, and it was to harmonize their views on these minor points that the second conference was held. A much larger number of governments were represented. Of those which took part in the conference of 1880, Austria and Turkey were unrepresented. Representatives were present from the United States, France, England, Italy, Spain, Portugal, Russia, Sweden and Norway, Belgium, Holland, Switzerland, Roumania, Servia, Luxemburg, Brazil, the Argentine Republic, Uruguay, Guatemala, and San Salvador. The plan is, to have a union, sitting at Berne, which will represent the states whose patent laws are sufficiently in harmony, and endeavor to secure greater assimilation and the enjoyment of the rights possessed by the citi-

zens of each by the citizens of all the others. One of the main points is, that a patentee or proprietor of a trade-mark or design will have a prior right of registration throughout the union. This will protect him against being forestalled by dishonest agents. Regulations for the protection of patentable devices, designs, and trade-marks during international exhibitions are recommended. The convention proposes also to protect trade-names without registration, whether they form part of a trade-mark or not.

PENNSYLVANIA. State Government.—The following were the State officers during the year: Governor, Robert E. Pattison, Democrat; Lieutenant-Governor, Chauncey F. Black; Secretary of State, William S. Stenger; Treasurer, S. M. Bailey; Auditor-General, John A. Lemon; Secretary of Internal Affairs, J. Simpson Africa; Attorney-General, Louis C. Cassidy; Superintendent of Public Instruction, E. E. Higbee; Insurance Commissioner, J. M. Forster. Judiciary, Supreme Court: Chief Justice, Ulysses Mercur; Justices, Isaac G. Gordon, Edward M. Paxson, John Trunkey, James P. Sterrett, Henry Green, and Silas M. Clark.

Legislative Session.—The Legislature convened on January 2d, and adjourned on June 6th. The Governor immediately called an extra session, to begin on the following day, which did not finally adjourn until December 6th. In the call the Governor uses the following language:

The Constitution commands the General Assembly, "immediately after each State decennial census," to apportion the State into senatorial and representative districts. This imperative mandate has not been obeyed. Equally important and necessary, though not so specifically commanded by law, is the duty of the Assembly to apportion the State into congressional and judicial districts. I therefore designate the apportionment of the State into senatorial, representative, congressional, and judicial districts, as subjects for legislative consideration.

Notwithstanding the length of the session, only the judicial apportionment was passed. On the others the two houses, the Senate having a Republican majority and the House a Democratic majority, failed to agree.

Of the 670 bills introduced in the Senate and House, 253 were passed finally. Of this number 60 were vetoed. Among those that became laws were the following:

To prohibit the receiving and detaining of children in almshouses, and to provide for the care and education of such children.

To abolish the contract system in prisons, and regulate the wages of the inmates.

Requiring the assessors to make return of timberlands.

To provide payment to the miner for all clean coal mined by him.

To fix the salaries of county officers in counties containing over 500,000 inhabitants.

Providing that wages of servant-girls, washer-women, cooks, and others shall first be paid from proceeds of sale of effects of insolvent debtors.

To authorize the discharge of prisoners confined in jail under the insolvent act.

Directing the investment of moneys remaining to the credit of the several sinking funds of cities of the

second class in loans of said cities, or of the United States or of the State of Pennsylvania.

To authorize in cities of the first class, wherever way-farers' lodges shall be established, the commitment of persons to the house of correction as vagrants who shall obtain shelter and food from such lodges and who shall refuse to perform work in return therefor when physically able to work.

For the better security of bituminous-coal miners.

To prohibit political parties, committees, or members thereof, from demanding from public officials contributions for political purposes.

To prevent the selling of theatre tickets on the public streets and highways.

To prevent the consolidation of competing pipe lines.

Providing for the care and treatment of the indigent insane in the State hospitals.

To provide for the manner of decreasing the capital stock of banking corporations.

A supplement to the corporations act of 1874, to authorize the formation of corporations for driving and floating saw-logs, lumber, and timber. Such corporations are given power to straighten and deepen and erect dams, cribs, and other improvements in streams not exceeding twenty miles in length, and charge tolls not exceeding 10 cents for 1,000 feet, board measure.

Fixing the salaries of county officers in counties containing over 100,000 and less than 150,000 inhabitants, and requiring the payment of the fees of such officers into the respective county treasuries. The salaries are as follow: District attorney, \$3,000; sheriff, \$4,000; prothonotary, \$3,000; clerks of courts, \$2,000; register, \$2,500; recorder, \$3,000; treasurer, \$3,000; county surveyor, \$150; commissioners, each, \$1,000; auditors, \$250; solicitor, \$500; directors of poor, \$860; jury commissioner, \$250; coroner, \$1,000.

To require a brand upon all goods made for sale by convict labor.

To make accepted orders and certificates for petroleum negotiable.

To provide for gauging the petroleum in the custody of and examination into the conditions of firms and corporations engaged in the business of storing and transportation by means of pipe lines.

To provide for the disposal of the property of unincorporated associations organized for benevolent, charitable, or beneficial purposes upon the dissolution, expulsion, surrender of warrant or charter or vacation of the same.

Requiring anthracite-coal operators to keep ambulances for the conveyance of injured miners.

For the appointment of a commission of six practical miners and six practical operators to revise the mining and ventilation laws relating to the anthracite-coal region.

Requiring the owner, lessee, agent, or foreman of every anthracite-coal mine to furnish props and timbers for the safe running of the coal.

Requiring the owners of hotels, seminaries, colleges, academies, hospitals, asylums, storehouses, factories, manufactories, workshops, tenement-houses, and the directors of public schools, to have fastened to the inside of each of six window-heads on the third and every additional story a chain ten feet in length to which a rope at least an inch in diameter shall be affixed of sufficient length to reach the ground. A proviso requires such a rope and chain to be furnished in each room of a hotel above the second story.

The Wallace arbitration act. This bill provides that the Judge of Common Pleas Court or the President Judge in Chambers shall, upon the petition of fifty workmen employed by five different firms, or five employers who employ at least ten workmen each, or a firm employing at least seventy-five men, appoint a tribunal of an equal number of employers and workmen, the exact number to be stated in the petition and not to be less than two of each, for the adjustment of disputes in the iron, steel, glass, textile fabrics, and coal trades. If after three meetings the tribunal is unable to make a decision, an umpire shall

be selected "by the mutual choice of the whole of the representatives of both employers and workmen constituting the tribunal," who shall decide the points submitted to him in writing within ten days. The award when made and signed by the umpire may be made a matter of record by presenting it with the submission in writing to the proper judge, who indorses his approval and directs it to be entered on record. "When so entered it shall be final and conclusive, and the proper court may, on motion of any one interested, enter judgment thereon, and when the award is for a specific sum of money may issue final and other process to enforce the same."

The anti-discrimination bill, declaring "undue and unreasonable discrimination" to be unlawful, and providing that "no railroad company or other common carrier engaged in the transportation of property shall charge, demand, or receive from any person, company, or corporation for the transportation of property, or for any other service, a greater sum than it shall charge or receive from any other person, company, or corporation for a like service from the same place upon like conditions and under similar circumstances, and all concessions in rates and drawbacks shall be allowed to all persons, companies, or corporations alike for such transportations and service upon like conditions under similar circumstances and during the same period of time. Nor shall any such railroad company or common carrier make any undue or unreasonable discrimination between individuals or between individuals and transportation companies in the furnishing of facilities for transportation."

The abolition of the useless and expensive office of sealer of weights and measures and of recorder for cities of the first class, the passage of the Wallace voluntary labor tribunal act, the several acts broadening and liberalizing the provisions of the free railroad law, the act known as the free-pipe law, the act prohibiting the consolidation of telegraph companies, and the act to enforce the provisions of the seventeenth article of the Constitution relative to railroads and canals, were made in obedience to the demand of the people.

For the expenses of the extra session, the sum of \$543,053.93 was appropriated.

Finances.—The annual statement of the Treasurer includes the receipts from Dec. 1, 1882, to Nov. 30, 1883, both days inclusive, and a summary of it is given below:

Lands.....	\$5,150 99
Tax on corporation stock and limited partnerships.....	2,069,083 08
Tax on gross receipts.....	687,556 08
Tax on coal companies.....	7,145 08
Tax on bank-stock.....	265,468 56
Tax on net earnings or income.....	59,126 18
Tax on gross premiums.....	39,685 30
Tax on loans.....	148,869 95
Tax on personal property.....	874,819 47
Tax on writs, wills, deeds, etc.....	108,009 89
Tax on collateral inheritances.....	604,764 65
Tax on sale of fertilizers.....	4,990 00
Foreign insurance companies.....	255,660 18
Tavern licenses.....	489,985 56
Retailers' licenses.....	815,128 76
Eating-house licenses.....	83,173 51
Brewers' licenses.....	11,960 89
Billiard licenses.....	88,886 05
Brokers' licenses.....	17,960 29
Auctioneers' licenses.....	14,188 75
Liquor licenses.....	80,872 56
Peddlers' licenses.....	2,745 66
Patent-medicine licenses.....	3,501 84
Theatre, circus, etc., licenses.....	4,459 00
Bonus on charters.....	107,004 24
Office license-fees.....	5,827 00
Accrued interest.....	5,838 45
Penalties.....	129 53
Notaries' public commissions.....	10,950 00
Allegheny Valley Railroad Company.....	282,500 00
United States Government.....	85,766 58
Commutation of tonnage-tax.....	460,000 00

Annuity for right of way.....	10,000 00	Cost of building, purchasing, and renting.....	\$1,858,129 29
Escheat.....	5,349 85	Cost of fuel, contingencies, debt, and interest paid.....	\$2,154,805 71
Fees of public officers.....	44,177 22	Total cost for tuition, building, fuel, and contingencies.....	\$2,304,289 65
Refunded cash.....	684 10	Expenditures of all kinds.....	\$2,386,268 59
Dividends on stock owned by the Commonwealth.....	580 00	State appropriation.....	\$1,000,000 00
Conscience-money.....	18 75	Estimated value of school property.....	\$80,199,284 00
Miscellaneous.....	4,968 05		
Total.....	\$4,775,480 19		

The expenditures for the same period amounted to \$6,708,690.22, including: Expenses of government, \$1,592,084.52; loans redeemed, \$506,000; interest on loans, \$374,704.50; purchase of United States bonds, \$969,812.50; common schools, \$1,080,409.92; charitable institutions, \$600,778.71; soldiers' orphan schools, \$351,101.18; penitentiaries, \$224,297.25; State Industrial Reformatory, Huntingdon, \$87,500; House of Refuge, Philadelphia, \$40,500; Pennsylvania State Reform School at Morganza, \$57,800; National Guard of Pennsylvania, \$215,324.83.

The following statement shows the indebtedness of the State on Dec. 1, 1883:

FUNDED DEBT.	
Three and one-half per cent. currency loan.....	\$2,580,000 00
Four per cent. currency loan.....	8,540,000 00
Five per cent. currency loan.....	7,928,700 00
Six per cent. Agricultural College scrip.....	500,000 00
Total interest-bearing debt.....	\$19,548,700 00

Unfunded debt and debt upon which interest has ceased:

Relief notes in circulation.....	\$94,158 00
Interest-bearing certificates unclaimed.....	4,448 88
Interest-bearing certificates outstanding.....	13,098 54
Six per cent. Chambersburg certificates unclaimed.....	148 66
Domestic creditor.....	25 00
Five per cent. bonds on which interest has ceased.....	\$1,814 70
Six per cent. bonds on which interest has ceased.....	38,950 00

Public debt, Dec. 1, 1883..... \$19,718,788 28

The total number of taxables in the State is 1,141,849, and the total value of all real estate is \$1,598,430,041. The value of real estate exempt from taxation is \$110,000,126. Of this aggregate, \$80,697,201 is in Philadelphia. There are only four counties whose valuations are less than a million each, and these are Sullivan, Pike, Fulton, and Cameron. The horses and mules over four years of age number 484,365 in the State, and the cows and neat-cattle number 675,842—the value of the horses being \$21,790,526, and that of the cattle \$11,587,315. The tax laws are exceedingly faulty, and the burdens imposed under them are very unequally distributed.

Schools.—The following statistics are from the report of the superintendent for the year ending June 4, 1883:

School districts in the State.....	2,227
Schools.....	19,542
Graded schools.....	3,397
Male teachers.....	8,600
Female teachers.....	13,414
Average salaries for male teachers per month.....	\$37 08
Average salaries of female teachers per month.....	\$30 05
Average length of school term, in months.....	7-09
Number of pupils.....	957,680
Average number of pupils.....	626,268
Cost of tuition.....	\$5,198,691 74

Political Conventions.—The Republican State Convention met in Harrisburg on July 11th, and nominated Jerome B. Niles, of Tioga county, for Auditor-General; and William A. Linsey, of Allegheny county, for State Treasurer. The platform declared for a protective tariff; distribution to the States of surplus in the national treasury; full redemption of the trade-dollars; civil-service reform; reform in the State government; and commending the administration of President Arthur.

The Democratic State Convention met in Harrisburg on August 1st, and nominated, for Auditor-General, Robert Taggart, of Warren county; for State Treasurer, Hon. Joseph Powell, of Bradford county. The platform declared for civil-service reform, by electing good men to office; for such imposition of import duties as will "prevent unequal burdens, encourage productive industries at home, and afford just compensation to labor, but not to create or foster monopolies"; that the surplus in the national treasury should be applied to payment of the debt; that internal taxation should be abolished; that public lands should be reserved for actual settlers; that "the administration of Gov. Pattison has vindicated the pledges of reform upon which it was elected"; that "the action of the Legislature in passing laws to protect honest working-men from being brought into competition with convict-laborers is to be recommended"; and that "tax laws of the State should be carefully revised, and so changed as to make them bear equally upon all classes of property."

Temperance.—The third annual State Convention of the Constitutional Temperance Amendment Association was held in Bellefonte on May 24th and 25th. The resolutions adopted contained the following passages:

That we hold up to public reprobation the vote by which the House of Representatives not only so wantonly disregarded the respectful request of such a large number of their voting and non-voting constituents for the submission of a prohibitory amendment to the decision of the sovereign people, but also by so doing struck a dangerous blow at the sacred right of petition; . . . that we appoint two delegates to attend the annual convention of the Superintendents of Common Schools of Pennsylvania, and also the State Teachers' Association, in order to press upon these bodies the importance of introducing into the schools instruction on the nature of alcohol, and its effects upon the human body and character.

Election.—At the election in November, the Republicans were successful. The vote was as follows: for Auditor, 319,106 Republican, 302,031 Democratic, 6,602 Prohibition, and 4,452 Greenback; for Treasurer, 321,050 Republican, 300,999 Democratic, 6,687 Prohibition, and 4,481 Greenback.

PENSIONS, INCREASE OF. See page 248.

PERSIA, an empire in Asia. The government is an absolute monarchy, based on the precepts of the Koran, resembling very nearly in constitution that of the Turkish Empire. The Shah, or Emperor, claims absolute obedience, as the vicegerent of the Prophet. Under him the government is carried on by a ministry composed of the Vizier-i-Azem, who directs the foreign policy and acts as military commander-in-chief; the Ameen-ed-Doulah, or treasurer; and five subordinate ministers, created after the model of European cabinets. The country is divided into fifteen provinces, each governed by a Beglerbeg, who is usually a prince of the royal family. The towns and villages elect their own magistrates.

The reigning Shah is Nassr-ed-Din, born Sept. 4, 1829, who succeeded his father, Shah Mohammed, Sept. 10, 1848. He is the fourth sovereign of the Kadjar family. The heir presumptive is his son, Muzaffer-ed-Din, born in 1852. He is governor of the province of Azerbaijan. The second son of the Shah, Massoud Mirza—called Zil-es-Sultan—is governor of Ispahan. The Shah has the right to change the regular order of succession, and appoint any member of the royal family to follow him upon the throne.

Area and Population.—The area is about 633,000 square miles. A large portion of this territory is desert. The population is estimated at 7,653,600, of whom about 1,968,800 are inhabitants of cities, 3,780,000 of villages and rural districts, and 1,909,800 are nomads. In every 1,000 of the Mohammedan population 495 are males and 505 females. The population of the principal cities is estimated as follows:

CITIES.		CITIES.	
	Population.		Population.
Teheran	300,000	Ispahan	60,000
Tabreez	165,000	Moshed	60,000

The inhabitants of the towns and country districts are mostly of pure Persian race. The nomad population is divided into 260,100 Arabs, 720,000 Tartars, 675,000 Kurds and Leks, 20,700 Beloochees and Gypsies, and 284,000 Bahiars, etc.

Religion.—The population is divided in respect to religion approximately as follows:

CREEDS.	Number.
Shiites	6,860,600
Sunnites, etc.	700,000
Armenians	43,000
Nestorians and Chaldeans	28,000
Israelites	19,000
Parsees	8,000
Total	7,653,600

The Shiites differ in doctrine and in tradition from the Sunnites, who compose the population of the Turkish dominions. The Persian priesthood consists of a variety of orders. The chief of these are the Mooshtehed, of whom there are five. These are appointed by the choice of the people, and are the real heads of the clergy. The one who resides at Kerbela, near Bagdad, is recognized as the chief. The official hierarchy has for its chief dignitaries

the Imans Djouma and Sheiks-ul-Islam, who are appointed by the Government and receive salaries from the state. The ordinary ministers of religion are of three classes: the mootourelles, one for each mosque and place of pilgrimage; the muezzina, or sayers of prayers; and the mollahs, or performers of rites. The Armenian and Nestorian Christians are treated with tolerance, but the Jews and the Parsees, or Guebres, suffer persecution.

Education.—Much attention is paid to education. There are numerous colleges supported by the Government, and private instructors are employed by families that have the means. Students are instructed in the Persian and Arabic languages and literatures and in certain sciences, as well as in religion.

Army.—By the law of 1875 it was proposed to introduce the system of conscription and limited terms of service, but the old system is still in practice. The army is organized by provinces, tribes, and districts. The local and tribal chiefs are usually the military commanders. The army is reported by the Minister of War as numbering 105,000 men. A standing force of about 30,000 men is kept in active service. It is composed of 18,000 nizams or regular infantry, 10,000 irregular cavalry, 500 cavalry organized and trained like Cossack regiments by Russian officers, and 1,500 artillery trained by Austrians and armed with Uchatius guns. The remainder of the army forms a reserve which is subject to no drill or discipline unless called out by the Minister of War.

Revenue.—The entire revenue of the country is at the disposal of the Shah, who, with the other members of the royal family, usually amasses a large fortune. That of the present Shah is estimated at \$20,000,000, half of it in diamonds and other precious stones. The receipts and expenditures are known only by estimates. About one fourth of the revenue is paid in kind and is reserved for the use of the army and the Shah's household. The army and the salaries of the priesthood consume the main portion of the annual receipts. The surplus is paid into the treasury of the Shah. The revenue is apportioned to the towns, villages, and districts, each of which has to contribute a certain amount fixed periodically by assessors. The main incidence of the taxes is upon the Mohammedan laboring population. The revenue from 1872 to 1875 averaged about \$9,500,000, and the expenditure \$8,780,000. The receipts in 1876 amounted to about \$6,945,000 in money and \$1,270,000 in kind. Over \$6,000,000 of the total was raised by direct taxation, and the rest by customs. The expenditures were about \$8,000,000. The following were the principal items: Army, \$3,892,000; royal court, \$1,536,000; clergy, \$1,200,000; gifts to great families, Afghans, and others, \$400,000; foreign affairs, \$140,000; other departments of state, \$300,000; colleges, \$80,000. There is no public debt.

Commerce.—The total value of the imports

approximates \$12,500,000 per annum; that of the exports, \$7,500,000. The external commerce is mainly with Europe, through Tabreez, by way of Constantinople. All goods are forwarded by caravans between Tabreez and Trebizond. There is also a growing commerce with Russia on the north. In 1883 Russia prohibited the free transit of foreign goods through the Trans-Caucasian provinces, imposing protective duties, so as to give her own products a monopoly in the markets of the neighboring parts of Persia. The chief article of import is cotton goods, of British manufacture, which were imported to the average value of \$4,000,000 during the five years ending with 1880. Other imports are glass, paper, iron, copper, sugar, and tea. The chief article of export until recently was silk, shipped to Great Britain and France. Of late years opium has become the most important article. The exports from the ports of the Persian Gulf of this commodity increased from \$348,000 in 1879 to \$4,285,000 in 1881. Carpets are exported to Europe of the value of about \$500,000 per annum. Other exports are tobacco, skins, gums, wool, dates, grain, and rice.

Posts, Railroads, and Telegraphs.—A postal service, established by Europeans, was opened in 1877. Mails are conveyed between Julfa, on the Russian frontier, Tabreez, Teheran, and Reshd, on the Persian Gulf. The number of letters forwarded in 1879 was 426,008.

At the end of 1879 there were 3,367 miles of telegraph in operation, with 5,660 miles of wire. The number of dispatches transmitted in 1878 was 500,000, the receipts about \$45,000.

In November, 1882, the Government arranged with a French syndicate for the construction of the first line of railroad, to run from Reshd to Teheran, 250 miles.

PERU, a republic of South America. Area, about 540,000 square miles; capital, Lima. By virtue of the treaty concluded with Chili in 1883 (see CHILI), Peru has ceded to the latter the province of Tarapacá, and Chili may furthermore acquire from Peru the provinces of Tacna and Arica, if, ten years after the date of the treaty, the people of those provinces should so decide; but such decision will involve a pecuniary indemnity by Chili to Peru. The cession of Tarapacá has diminished the area of Peru by 20,600 square miles.

According to the census of 1876, Peru had a population of 2,699,945, of whom 1,865,895 were males and 1,384,050 females, without counting about 850,000 wild Indians. The cession of Tarapacá has taken away 42,000 citizens, 28,014 of whom were males and 13,988 females, thus leaving Peru a population of 2,657,948; or, if the wild Indians be added, about 3,000,000.

The principal cities are: Lima, the capital, with 101,488 inhabitants; Callao, 83,502; Arequipa, 29,237; Cuzco, 18,370; and Chiclayo, 11,325.

Government.—The President of the Republic

is Gen. Iglesias. The Cabinet was composed of the following ministers: Minister of State and Justice, Señor Barinega; Foreign Affairs, Señor Lavarelle; War, Gen. Osma; Finance, Señor Malpartida.

The United States Minister at Lima is Capt. S. L. Phelps. The Peruvian Minister at Washington is Señor J. F. Elmore; and the Consul at New York, Mr. J. C. Tracy.

Army.—During the war, Peru had enrolled for active service about 16,000 men.

Navy.—Prior to the outbreak of hostilities, the Peruvian navy was composed of four iron-clad steamers, one of which was a frigate of 550 horse-power, mounting 22 guns; one ram of 300 horse-power and 5 guns; two monitor-rams, each 330 horse-power and 2 guns; six steamers, one a frigate of 400 horse-power and 18 guns; two schooners, each of 180 horse-power and 6 guns; and three steam transports, one of 400 horse-power and 4 guns, one 90 horse-power, and one 250 horse-power and 6 guns. There were also three school-ships and two steamers, and five river-steamers of 886 horse-power. The entire naval force was therefore eighteen vessels, with a joint horse-power of 3,396, and mounting altogether 66 guns. The war caused the destruction of the iron-clad frigate and of one monitor, while the ram and one corvette were captured by the Chilean navy.

(For a sketch of the war in 1883, and other events connected with it, see BOLIVIA.)

Finances.—The public indebtedness on Jan. 1, 1876, was as follows:

Internal debt	\$24,952,158
Foreign debt:	
Ecuador bonds	985,580
The Pisco-Ica loan	1,223,400
The loan of 1870	56,684,900
The loan of 1872	107,788,700
	165,980,580
Floating debt	22,000,000
Grand total	\$213,582,468

On the date above named, the coupons of Peruvian bonds failed to be paid, but it was officially declared that this was only a "momentary interruption of punctuality." Since then there have been two short periods when there was some hope that something would be done to satisfy the bondholders. The first of these periods fell in the year 1877, when the so-called "Raphael contract" raised such expectations; and the second occurred in 1880, when the committees, till then hostile to each other, blended into one and accepted the Chilean proposals. But on reviewing the past eight years it will be found that the names of the Société Générale, the Peruvian Guano Company, the Raphael contract, the Dreyfuss lawsuit, the Sir Charles Russell Committee, the Croyle Committee, the MacKellar & Co. contract, the agents Anthony Gibbs & Co., and the Peruvian and Chilean Government representatives, are mixed up in such inextricable confusion that it would be useless to wade through the history of the many guano con-

tracts concluded during this period of eight years. We shall, therefore, only take up the thread of events as directly bearing on this complicated question at the moment when Chili, as the conqueror of Peru, took possession of the territory in which the guano deposits are situated.

In December, 1879, Chili gave official notice of her occupation of the guano and nitrate-of-soda districts, and warned the French banking-houses with which Peru was negotiating not to enter into contracts with the Peruvian Government, nor make advances on such contracts. The Peruvian agents applied at once to the English bondholders, through the *Crédit Industriel de Paris*, after abandoning the *Société Générale* and *Dreyfus*, and offered, under certain conditions, to transfer to them the guano deposits. By doing so, they engaged to do what they were unable to carry out; Chili consequently immediately took the matter into her own hands. The Chilean Government offered the bondholders, on condition of payment of a tax of £1 a ton on guano of a low grade, and 80 shillings a ton for a higher grade selling over £11, to put them in actual possession of the guano, and that she would hold herself responsible for having the agreement maintained in the treaty of peace, whenever this was restored. The bondholders, at a general meeting held on Feb. 2, 1880, accepted the proposition unanimously. The committee of Mr. Oroyle and the one of Sir Charles Russell were thereupon blended into one, and a few weeks later the joint committee began chartering vessels for the loading of guano. In the summer of 1880 it was ascertained that Chili had resolved to turn the guano deposits in the province of Tarapacá to her own use, and that the tax on guano shipments from *Pabellon de Pica*, *Lobos*, and *Huanillos* islands was to be, without distinction, 80 shillings a ton. But this was not all, for Chili virtually shipped a number of cargoes for her own account, and informed the committee of bondholders that proof would have to be furnished that the committee was a representative one in fact. This proof was furnished early in 1881, when, out of £33,000,000 outstanding bonds, no less than £23,000,000 were registered at Mr. Martin's bank, London. A temporary contract, which the Chilean Government had made with Messrs. MacKellar & Co., was supplemented in the spring of 1881 by a formal arrangement with Messrs. Anthony Gibbs & Co.

Toward the close of 1881, Anthony Gibbs & Co. announced that £120,000 worth of guano sales effected only netted to the credit of the bondholders £17,829. The latter thus perceived that, with the high tax on low-grade guano, there was little prospect of their ever realizing much, if anything, from the sales. The bondholders then made direct application at the seat of government, and the result was the Chilean decree of Feb. 9, 1882, agreeing to share equally with the bondholders

in the proceeds of sales, and at the same time ordering Messrs. Gibbs and MacKellar to liquidate their claims. Simultaneously tenders were invited by the Chilean Government for the conclusion of a fresh guano contract embracing 1,000,000 tons, the Government declaring its readiness to deposit 50 per cent. of the net proceeds in the Bank of England. This contract was made with a French syndicate of capitalists. In May, 1883, it was estimated that £260,000 had thus accumulated, and that 75 per cent. thereof ought to be distributed among foreign creditors as the result of three years' accumulations.

On Oct. 20, 1883, the treaty of peace was signed at Lima, in which it was provided that the net proceeds of Chili's sale of 1,000,000 tons of guano, "after deducting the expenses and other charges specified in Article XIII of the said decree, shall be equally divided between the Government of Chili and the creditors of Peru whose claims may be found to be supported by the guarantee of the guano. When the sale of this 1,000,000 tons is concluded, the Government of Chili will continue paying over to the Peruvian creditors 50 per cent. of the net proceeds of the guano, as established by the said Article XIII, until the debt is covered or the deposits now being worked are exhausted. The products of the deposits or beds that may hereafter be discovered in the ceded territory are to be the property of Chili."

Peru began the year 1884 with her finances in a most deplorable condition. The additional protocol of the treaty stipulates that "to meet in part the expenses to be incurred by Chili in maintaining the army of occupation, the Government of Peru will deliver monthly to the general-in-chief of those forces the sum of \$300,000 in current silver coin, which sum shall be appropriated from the national revenues of Peru, with preference to the payment." On Jan. 1, 1884, \$100,000 had been paid to the Chileans out of the \$600,000 then due. It was said that Chili would not press for the remainder, but would hold Mollendo, the port of Arequipa, and appropriate the customs due there, then about \$150,000 monthly, until the monthly payments were satisfied.

The Postal Service.—In 1878 there were about 300 post-offices, and they forwarded inland 2,758,829 letters, and by the sea route, 2,051,202, besides 2,360,249 newspapers.

Railroads.—In 1878 there were in operation 1,581 miles of railroad, of which 1,210 miles were Government property. Chili declined to sanction the building of any new railroads in Tarapacá prior to the ratification of the treaty of peace. The famous Oroya Railway is a stupendous work of engineering skill. It was originally intended to connect the Peruvian sea-coast with the head-waters of the Amazon, and establish communication with the rich silver-mines of Cerro de Pasca. The Peruvian Government bore the expense, \$25,000,000, although only 86½ miles have been completed,

and the object is still some hundred miles from attainment. (See ENGINEERING, page 317.)

Telegraphs.—There was a total length of wire in 1878 of 1,398 miles. The service was carried on by thirty-four offices, dispatching 94,214 private and 16,455 Government messages.

Commerce.—The exports from Peru to the United States during the fiscal year 1882 amounted to \$3,084,476, including 20,522 tons of guano and 114,176,044 pounds of nitrate of soda, against \$2,526,918 in 1883, including 102,894,860 pounds of nitrate and no guano. The export of domestic goods from the United States to Peru was \$538,828 in 1882, and \$487,860 worth in 1883.

PHARMACY. The art of preparing and dispensing remedies, occupying a position between chemistry on one side and medicine on the other, has developed in recent years to such an extent that it now claims a position among the sciences. Special schools for it are found in many of our cities; large organizations, both scientific and trade, protect its interests; the preparation of pharmaceutical compounds has become an important constituent of our manufacturing industries; and special legislative measures govern the dispensing of medicines and poisons. Pharmaceutical literature is large and rapidly increasing.

Colleges.—There are fourteen institutions devoted to the education of pharmacists in this country. The Michigan School of Pharmacy was organized in 1867 as a professional department of the State University at Ann Arbor. The course of study at this school occupies two years, during which instruction is given in the various branches of analytical chemistry, pharmacy, materia medica, etc., with laboratory work of four or five hours daily. A three years' course is optional. The degree conferred is that of Pharmaceutical Chemist (Ph. C.). This school, although offering the most thorough courses of study, and requiring the highest qualifications, does not insist on previous practical experience in pharmacy, and therefore is not classed with the so-called "teaching-colleges of pharmacy," whose diplomas, conferring the degree of Graduate in Pharmacy (Ph. G.), are granted only to such students as have had four (or "several") years of actual experience in a drug-store, in addition to attending the prescribed course of the college. The following are the recognized "teaching-colleges" of pharmacy:

Albany College of Pharmacy, established as a department of pharmacy of Union University, at Albany, June 21, 1881, and incorporated as the Albany College of Pharmacy, August 27th of the same year.

California College of Pharmacy, established in 1878 as a department of pharmacy at the University of California. It is in San Francisco.

Chicago College of Pharmacy, established in 1866.

Cincinnati College of Pharmacy, established in 1871.

Louisville College of Pharmacy, established in 1871.

Maryland College of Pharmacy, instituted in 1841, at Baltimore.

Massachusetts College of Pharmacy, Boston, Mass.,

instituted in February, 1823; reorganized in April, 1881, and incorporated in April, 1882.

Philadelphia College of Pharmacy, organized in 1821, received its charter from the State in 1822.

Pittsburg College of Pharmacy, organized in August, 1878, received its charter during the same year.

St. Louis College of Pharmacy, established in 1865.

National College of Pharmacy, established in 1871, in Washington, D. C. This institution confers the degree of Doctor of Pharmacy (Phar. D.).

Louisville School of Pharmacy for Women, at Louisville, Ky., established in 1883.

Department of Pharmacy, University of Wisconsin, Madison, established in 1883.

There are two Canadian schools of pharmacy: the Montreal College of Pharmacy, in its sixteenth year; and the Ontario College of Pharmacy, established in 1883.

Pharmaceutical Associations.—The American Pharmaceutical Association, organized in 1852, has a large and increasing membership (about 1,400). It has members from all parts of the country, and holds annual meetings in September at some city previously selected. The following is a list of the State Associations, with the date of their organization:

Alabama.....	1899	Missouri.....	1873
Arkansas.....	1888	New Hampshire.....	1873
California.....	1869	New Jersey.....	1879
Connecticut.....	1876	New York.....	1879
Georgia.....	1875	North Carolina.....	1869
Illinois.....	1880	Ohio.....	1879
Indiana.....	1883	Pennsylvania.....	1873
Iowa.....	1880	Rhode Island.....	1874
Kansas.....	1880	South Carolina.....	1873
Kentucky.....	1873	Texas.....	1880
Louisiana.....	1883	Vermont.....
Maryland.....	1888	Virginia.....	1863
Massachusetts.....	1869	West Virginia.....	1881
Michigan.....	1888	Wisconsin.....	1880
Mississippi.....	1888		

These associations convene annually. Their exercises consist of reports of committees on questions of scientific or trade interest, and the reading of papers treating of subjects pertaining to pharmacy, with discussion thereon.

Trade Organizations.—The most important of these is the National Wholesale Drug Association, which was established in 1875 as the Western Wholesale Drug Association, and in 1882 became the National Association. Its principal object is the correction of excessive and unmercantile competition, and the removal, by concert of action, of all evils and customs that are against good policy and sound business principles. Its membership includes representatives of nearly all the important houses dealing in drugs in this country. In September, 1883, was organized at Washington, D. C., the National Retail Druggists' Association. This is for the protection of the business interests of the retail trade, and to devise measures for the prevention of disastrous competitions. It is hoped that a uniform schedule of prices may be established, so as to break up the prevalent "cutting" of rates. There are also several local societies.

Pharmaceutical Legislation.—The rush of unqualified persons into the drug business has made apparent the necessity of restricting the practice of pharmacy by law to those who are qualified. To ascertain the qualification of ap-

plicants for licenses, in such States as have pharmacy laws, boards of pharmacy have been appointed from among the best representatives of the profession, to examine candidates and grant diplomas allowing them to practice. Many of the States have pharmacy laws, but they differ very greatly, and an effort is being made to establish uniformity throughout the country. Certain portions of the Union are still without any laws on this subject.

Literature.—The "Pharmacopœia of the United States" is the recognized official manual of the pharmacists. This work is revised and issued every ten years by the authority of a National Convention held at Washington, and composed of delegates from the medical and pharmaceutical colleges. Although not authorized by the Government, it is accepted as the authority by which legal disputes relative to drugs shall be settled. The present edition is the sixth decennial revision, of 1880, and was published in 1882. The "Dispensatory of the United States," edited by H. O. Wood, Joseph P. Remington, and S. P. Sadtler, occupies the position of commentary to the Pharmacopœia. It gives very full descriptions of the articles mentioned in the "United States Pharmacopœia," and also includes those given in the "British Pharmacopœia." It further embraces extensive and comprehensive information in regard to other drugs and chemicals used in pharmacy and medicine, that are not official. A revised edition appeared in 1883. Other important works are: Parrish's "Treatise on Pharmacy" (Philadelphia, 1833), and "Lectures on Practical Pharmacy," by Barnard S. Procter (Philadelphia, 1833). Among the journals devoted to pharmacy are the "American Journal of Pharmacy," "The Druggist's Circular," the "American Druggist," and the "Weekly Drug News."

Practical chemistry and experimental therapeutics are continually adding new drugs and preparations to the resources of pharmacy.

PHYSIOLOGY. The Heart.—Dr. W. H. Gaskell, F. R. S., of Cambridge, has published ("Journal of Physiology") an account of experiments upon the innervation of the heart. Previous experiments in this line having been made with the heart of the frog, he selected the heart of the tortoise, so as to secure corresponding observations with other animal types for comparison. His investigations bore: 1. On the spontaneous rhythm of the different parts of the heart and of the heart as a whole; 2. On the sequence of the contractions of the different heart-cavities; 3. On the action of the cardiac nerves; 4. On the action of atropine and muscarine. Before the nerves of the heart and the ganglion-cells were known, the beat of the heart was attributed to the direct stimulating action of the blood on the cardiac muscle. The discovery of the cardiac ganglia and of their situation in the sinus, where the origin of the rhythmic beat was located, led to the hypothesis that they played the chief part in the

causation of the beat, although they were at the same time recognized as appendages to the nerves, and not separate, independent structures; and experiments were referred to which were thought to afford positive proof of the preponderating influence of the ganglion-cells in the causation of rhythm, and other experiments were thought to indicate the mode in which they acted. When, however, it became known that a constant stimulus, whether electrical, chemical, or mechanical, applied to the muscular tissue at the apex, could cause that muscle to beat rhythmically, even though no nerve-cells were to be found in it, the question arose, Are these motor centers really similar to those of the respiratory center, or is it not more likely that they supply a constant stimulus to the muscle, and that it is the property of the cardiac muscle to produce rhythmical results from that continually acting stimulation? On either view, certain ganglia are supposed to possess motor functions, upon which the heart-beat ultimately depends, and the cardiac muscle itself is not supposed to possess any power of automatic rhythm, but merely to contract rhythmically upon the application of a suitable external stimulus. The results of Dr. Gaskell's experiments are adverse to this hypothesis. In their light, the heart is conceived as a specially modified portion of the vascular system; as a piece of artery or vein, the muscular walls of which have developed in a special manner. The peculiarities of the cardiac muscle arise from its structural position, intermediate between unstriated and striated muscular fiber. Muscular tissues exhibit three different modes of responding to stimulation—"tonic," "rhythmical," and "rapid" contraction—according to their structure. The difference between them is clearly shown in a comparison of the tetanizing action of a strong interrupted current upon a strip of muscle from the bladder of the tortoise, and from the heart of the tortoise, and with the ordinary tetanus curve of the frog's gastrocnemius. The unstriated muscle of the bladder contracts slowly after a long latent period, with steadily increasing force during and even after the cessation of the tetanizing current, and the strip returns slowly to its original length. This represents a prolonged tonic contraction. The striated muscle gives the curve of tetanus, consisting of the superposition of a series of rapid contractions. And the cardiac strip gives a curve which is intermediate between the two, and may be described as a long-continued tonic contraction upon which are superimposed a number of rapid contractions that never succeed one another so quickly as to fuse together. The cardiac muscle, then, when tetanized gives a tetanus of tonicity in virtue of its relationship to unstriated muscle, and at the same time a series of rapid contractions in consequence of its affinity to striated muscle. When the vitality of the tissue is impaired, the cardiac muscle loses its power of rapid contrac-

tion, and the less specialized tonic power alone remains. The intermediate position of this muscle is also shown in the duration of its vitality after the death of the animal, which is less than that of unstriated muscle, but decidedly greater than that of the ordinary striated muscles. Evidence is accumulating that the power of rhythmical contraction is common to many different kinds of muscle; and as it has been developed to a greater extent in some unstriated muscles than in others, so it has reached a still higher stage—that of rhythmical automatism—in some kinds of cardiac muscle than in others. We may, then, compare the development of function in the three kinds of muscular tissue as follows:

Striated muscle of vertebrates: Rapidity of contraction most highly developed; tonicity rudimentary; rhythmic action still more rudimentary.

Cardiac muscle: Rhythmic action most highly developed; rapidity of contraction well marked; tonicity well marked.

Unstriated muscle: Tonicity most highly developed; rhythmic action well marked; rapidity of contraction most rudimentary.

Stimulation of the vagus nerve was found capable of producing opposite effects upon the rhythm of the heart, either of slowing, or stand-still, or of acceleration. The results are more constant with the tortoise, where a stand-still can always be obtained, frequently followed by acceleration, but not accompanied by evidence of a primary acceleration, than with the frog. The effects are almost exclusively produced through the fibers of the right vagus nerve. The auricular contractions only are affected by the stimulation, and this by being diminished in strength during its operation, and increased after it has been stopped. Nervous action has an effect competent both to depress and to exalt the conduction power of the muscular tissue of the auricle, and that independently of the action upon the force of the muscular contractions. It removes a partial block, and enables every contraction to pass the blocking-point by expediting the recovery of the conduction power of the muscle at that point, which would otherwise take place more slowly after the passage of each contraction-wave. While the initial effect of the vagus appears to be to depress some function, its final and most enduring power is to exalt, intensify, and repair that function. It may, therefore, be regarded as essentially the trophic nerve of the heart. Its effects on the contraction force and conduction power of the cardiac muscle are the same as those of an interrupted current applied to the muscle directly, which is too weak to cause muscular contractions. Atropine improves the contraction power, the rhythmical power, and the conduction power of the muscle, in a fixed and stable manner, but not necessarily lastingly. Muscarine depresses every function, but without preventing the possibility of a limited amount of improvement in it.

Messrs. H. H. Donaldson and Lewis T. Stevens, of Johns Hopkins University, have found, from experiments with digitaline on the heart of the frog and the terrapin, that the drug causes a decrease in the work done by the heart, that in moderate doses it increases the blood-pressure, and that it causes a rise of mean blood-pressure by constricting the arterioles, probably through its action on the muscular coats.

Taljanzeff states that, in violent breathing, partial or complete inhibition of the contractions of the right side of the heart may take place, without, however, any fall of arterial pressure resulting, the blood being forced from the right to the left side of the heart by the action of the breathing movements of the organ, especially on the right ventricle. He has discovered also that, if the branches of the vagus going to the lungs are cut, and their central ends stimulated, a decided reflex action on the heart and blood-vessels is obtained. In most cases the heart was slowed, giving the well-known "vagus-pulse," and the blood-pressure was lowered; though in one experiment there was a fall of aortic pressure, without any change in either the force or the rate of the heart contractions.

Gaule has shown that a frog's heart, washed out with dilute solution of common salt until it ceases to beat, is rendered capable of further pulsation when dilute alkaline solutions are sent through it; and he concludes that the alkali nourishes the heart. Martius, while confirming the experiment, dissents from the conclusion. The administration of the alkali, he finds, leads to a certain number of beats, but these soon cease, and a fresh supply of alkali is then inefficient, while other liquids, especially blood-serum, lead to renewed cardiac contractions. In his opinion, the frog's heart-muscle has in itself no store of energy-yielding material which it can call upon, but works at the expense of food-matters yielded it constantly by the liquid circulating through it. When the heart, irrigated with salt solution, ceases to beat, this is due to the saturation of its tissue with carbon dioxide, while still some nutrient matter (blood) remains not washed out from the ventricular network. The salt solution, acting merely as a medium for physical diffusion, can not remove the carbon dioxide as fast as it accumulates, and consequently the heart ceases to beat while it still has some available food. The alkali, on the other hand, chemically removes the injurious carbon dioxide; and the heart beats for a short time, using the food-stuff in the blood still present in its meshes. When the heart, treated with dilute alkali, ceased to beat, new pulsations could only be obtained by supplying it with liquids containing serum-albumen.

The Blood.—Several independent observers describe a new morphological element of the blood different in character from both the white and red corpuscles, and believed to be

the source of the fibrin which appears in the process of coagulation. According to Bizzozero's account, it is a colorless disk or lens-shaped body, with a diameter equal to from one quarter to one half that of a red corpuscle, and is perfectly destitute of hæmoglobin. Hayem and Laker state that it is biconcave, Bizzozero that it is not; while Laker and Bizzozero agree that it can not be considered an intermediate stage in the development of red corpuscles. The disks have also been examined by Norris, who claims to have described them under the name of "invisible corpuscles" as far back as 1878. Bizzozero believes that the fibrin is derived from the disintegration of these disks, and adduces several facts in support of his view, among which are—1. Liquids which have a tendency to prevent coagulation preserve also more or less completely these blood-plates from destruction. 2. Experiments made upon blood kept within the uninjured blood-vessels showed that as long as the blood remained uncoagulated, the blood-plates kept their shape, while the rapid coagulation of shed blood was always preceded by a destruction of the plates and the formation of granular masses from them. 3. When a drop of the blood was whipped with slender threads for about fifty or fifty-five seconds, and the threads were withdrawn and slightly washed with 0.75 per cent. of sodium chloride containing methyl violet, and then examined under the microscope in the same liquid, they were found covered with a layer of "plates," together with some white corpuscles. If the whipping was continued longer, the layer of plates became a granular mass or was transformed into a film of fibrin. The experimenter was able to a certain extent to watch this process, the deposition of the plates, their fusion into a granular mass, and the subsequent formation of fibrin, by observing under the microscope a thread placed in a slow current of blood. 4. When to a liquid containing fibrinogen and fibrinoplastin only, some of the colorless blood-plates adhering to a thread were added, coagulation followed. The mere presence of a foreign body, as a thread; was shown to have no effect. It was shown by satisfactory tests that the coagulation was not owing to the few red corpuscles which it was impossible to wash off the thread, nor to leucocytes adhering to the thread. The conclusion is drawn that the colorless plates must be assigned the chief part in coagulation. A pale nucleated plate, differing from the white corpuscles, and similar in functions to the colorless plate here described, has also been found in birds and amphibia.

L. O. Woolridge, D. Sc., of the Leipsic Laboratory, describes a series of experiments on dog's blood which tend to establish the fact that lecithin, a body omnipresent in protoplasm, can bring about coagulation.

Feuerstack, in a memoir on the development of the red blood-corpuscles, after reviewing the various theories on the subject, announces as

his conclusion: "We find in the circulation of animals with nucleated blood-corpuscles every possible transition between colorless and colored blood-corpuscles. That there are transition stages from the white to the colored cells is shown by the course of development during artificially induced blood-formation." Mr. Charles S. Minot suggests, in "Science," that the author has overlooked the more plausible view that the colored corpuscles are merely nuclei and not completed cells.

Dr. Richard Norris, of Birmingham, England, claims to have discovered that the white corpuscles of the lymph peel off the body of the cell, setting the nucleus free; that the latter then enters the circulation as a colorless disk which is ordinarily invisible, and gradually becomes colored by the endogenous secretion of hæmoglobin. He uses his alleged discovery to contradict some of the established views concerning the physiology and pathology of the blood. Mr. Ernest Hart has controverted his views, and, repeating his experiments, has shown that the methods employed create the colorless disk out of the red corpuscle by removing, in one manner or another, the hæmoglobin.

Regarding the influence of the inorganic constituents of the blood on the ventricular contraction, Prof. Sydney Ringer had shown from previous investigations that the contractility of the ventricle can not be supported without the presence of a lime salt in the circulating fluid; that lime salts greatly delay diastolic dilatation; and that this effect is obviated by a potash salt. He had further shown that a solution containing sodium chloride and a lime salt only will not sustain contractility so long as a mixture containing a potash salt in addition; and that sodium bicarbonate added to saline solution will not sustain contractility, nor will saline solution with sodium bicarbonate and potassium chloride. Yet sodium bicarbonate, or rather an alkaline state of the fluid, does favor contractility. In one of the experiments spontaneous contractions restored by sodium bicarbonate became even stronger than with the blood used at the beginning of the experiment. Continuing the discussion of his experiments, and seeking for the reason of this improvement, he observes that it can scarcely be maintained that an alkaline fluid is necessary, since in another experiment fairly good though weakened contractions persisted after feeding the ventricle with a neutral solution for ninety minutes and more. More probably, the acid developed in the muscles under contraction gradually weakens, and at last suspends contractility. It is certain that the sodium bicarbonate acts by virtue of its alkalinity, and not as a sodium salt, for the addition to the circulating fluid of calcium hydrate or ammonium carbonate will produce the same restoration of the beats. The amount of contraction, the duration of the contraction, the breadth of the trace, and the rapidity of dia-

toxic dilatation, depend entirely on the relative quantity of the normal saline constituents of the blood. With calcium chloride added to the saline, if the rhythmic contractions retain their normal frequency, we get increased breadth with rounding of the top of the trace, which leads to fusion of the beats, and the trace rises high above the top of the base-line. The effect of adding potash salt to the circulating fluid is to remove lime effects and restore good normal conditions. If the contractions are less frequent, or occur only with an excitation, the calcium chloride, like other lime salts, at first broadens the trace, rounding its top, and then greatly retards diastolic dilatation. Potassium chloride obviates these effects. The effects may be modified by introducing potassium bicarbonate, or by varying the amount of calcium chloride in the circulating fluid; but with a sufficient quantity of potassium chloride, no quantity of calcium chloride is capable of retarding diastolic dilatation.

The Nervous System.—From observations made upon dogs, to determine the connection of the semicircular canals with the function of equilibration, Bechterew has concluded that unilateral section is followed by forced movements of rotation around the axis of the body, with deviation of the eyes, nystagmus, etc., which movements are at first constant, but occur later in paroxysms separated by periods of rest. During the intervals between the paroxysms, the animal assumes a constrained position, lying on the opposite side to that of the section. The rolling movements finally cease, but the tendency to exhibit circus movements toward the injured side continues, while the animal is deficient in power to maintain its balance on its feet. These symptoms are reflex, for they are still exhibited after removal of the cerebral hemispheres, or in narcosis; but they are more marked when the hemispheres are present. Section of both auditory nerves is accompanied by marked deficiency of the power of maintaining equilibrium, so that the animal can neither stand nor walk. The forced movements when only one nerve is cut are due to the disharmony resulting from the presence of the normal semicircular-canal sensations on one side and their absence on the other. The balance is destroyed, and vertigo results. The well-known action of auditory impressions in influencing movements, as in dancing and marching, is thought, from these experiments, to occur through the semicircular canals.

In subsequent experiments Bechterew found that the central gray substance of the third ventricle forms an organ of equilibration in the same sense as the semicircular canals and the olivary bodies. Having prepared his subject so that a section could be made of the gray matter in any desired direction, he found that injury to any portion of that substance in the third ventricle was always followed by disturbances of equilibrium similar, in a general way, to those caused by section of the semi-

circular canals. Disturbances of equilibrium which have been noticed by other observers after sections in this region, but which were attributed to other parts, were, in Bechterew's opinion, probably caused by injury to the walls of the third ventricle. The presence of bodily equilibrium is brought about, according to this observer, by the action of three peripheral equilibrium organs; viz., the semicircular canals, the gray matter of the third ventricle, and the olivary bodies of the medulla. Each of these organs, it is interesting to notice, is not only connected with the cerebellum, through which it acts on the muscles, but is closely related also to one of the higher sense-organs: the olivary bodies, to the skin; the semicircular canals, to the ear; and the gray matter of the third ventricle, to the eye. The intimate connection existing between the organs of sight and equilibrium is known to all; and this connection depends not so much on the visual sensations as on the position of the eyeballs. Injury to the center in the third ventricle was always followed by marked changes in the direction of the axes of the eyeballs; and the author suggests that changes in the position of the eyeballs may, in their turn, act as mechanical stimulus to this center.

Experiments on dogs by Boehfontaine go to confirm the view of Flourens, ascribing vicarious functions to the cerebral convolutions. At one time electrical stimulation of a particular surface area, *a*, may, for example, be followed by a secretion of the submaxillary gland, or by some definite movement of a limb, while the same stimulus, applied to other regions of the cerebral surface, has no such consequences. In half or three quarters of an hour the region *a* will, however, cease to react to stimuli, while some other area, *b*, previously inexcitable, becomes irritable, and its stimulation is followed by the same phenomena as resulted from the stimulation of *a*. Boehfontaine suggests that the gray rind is itself not capable of electrical excitation, and that the result is always due to direct stimulation of subjacent medullated nerve-fibers. A bundle of such fibers, all with the same peripheral connection, may subdivide in the brain, and end in three or four different regions of its surface.

Dr. Seymour J. Sharkey, of St. Thomas Hospital, London, has described a number of cases within his practice bearing upon the subject of cerebral localizations, in the light of which he makes the statement that although there may be slight differences of opinion as to the exact limitation of the cortical centers, recorded cases present a striking agreement with regard to the most important facts. The conclusions which appear to be warranted from our present experience are: 1. That there are cortical centers, and that they are situated in the two ascending central convolutions, and in the convolutions adjacent to them on the internal aspect of the hemispheres. 2. That the centers for the arm, leg, and face are more

or less anatomically distinct. 8. That the centers for the lower part of the face and tongue are situated in the inferior extremity of the ascending frontal convolution, and that in most persons the posterior part of the inferior frontal convolution, and its junction with the ascending frontal in the left hemisphere, are specially connected with the faculty of speech. 4. That the centers for the arm are situated in the middle portion of both ascending convolutions, and that they extend into the upper third of these convolutions to a distance which is at present uncertain. 5. That the centers for the leg occupy the upper extremities of the two ascending convolutions and the parts continuous with them on the internal aspect of the hemispheres.

W. Kühne, having made observations of the motor-nerve endings on a considerable number of vertebrates, has given descriptions of the manifold forms of the terminal ramifications of the axis-cylinder in various species. By a special method of treatment he brings the axial-tree (*Axialbaum*), as he styles it, into a visible state while preserving its natural form, when the motor-plates can be seen with surprising distinctness. He has also devised a new method for isolating the end-plates, when the real arborization is revealed, quite different from the apparent arborization before isolation. The ramifications are composed of the axis-cylinder, and a sheath of substance which Kühne calls the stroma, separating the axis-cylinder from the fundamental substance of the motor-plate. The terminal ramifications in *Rana* (the frog) are formed, according to Trinchesi, of little disks, placed at more or less regular distances from one another, and separated by a homogeneous intermediate substance. From these ramifications on the side toward the muscles, run out numerous very fine filaments. The "longitudinal striæ" of the muscle have a similar structure to that of the axis-cylinder, being formed of disks united by clear intermediate substance; and the disks are united by lateral filaments with one another.

Beaunis has described the results of observations made upon himself with regard to the time that elapses between the stimulation of the sense of smell and the giving of the signal indicating the perception of the sensation. He finds that stimuli like ammonia and acetic acid, which excite not merely fibers of the gustatory nerve, but also nerves of common sensation, have a shorter reaction time than stimuli which act only or mainly on the nerve-fibers concerned with the sense of smell proper. In the cases of camphor, asafoetida, ammonium sulphide, chloroform, carbon disulphide, valerian, mint, and carbolic acid, the reaction time increases in the order of the names from '50 to '67 of a second. The moment of olfactory perception of musk could not be determined. The time of reaction appears to be longer in the case of this sense than in those of touch, sight, or hearing. Results in the main concordant

with these have been reached by Buccola of Turin.

Digestion.—Herzen, investigating the functions of the spleen, has brought forward a theory by which the apparently contradictory conclusions of Schiff and Heidenhain may be reconciled. Schiff was led to believe that after removal of the spleen, the pancreatic secretion lost its power of digesting proteids, and concluded that, though the spleen did not itself make the proteolytic ferment, it furnished to the blood something essential to the formation of it in the pancreas. Heidenhain showed, in 1875, that a substance (zymogen) capable of yielding proteolytic ferment accumulated in the pancreas quite independently of the presence or absence of the spleen. Herzen has found that, after removal of the spleen, the pancreas may still heap up zymogen (*trypso-gen*), but that this is not under such circumstances transformed into a proteolytic ferment (*trypsin*), as it is normally when the spleen is present, and in physiological activity. Hence, after splenotomy, or in cases of serious splenic disease, the digestion of albuminous substances is greatly impaired.

Winogradow has described the results of spleen extirpation as manifested in the blood, lymphatic glands, and bone-marrow of dogs, several of which were kept alive, in good health, for more than two years after the splenotomy. The number of red corpuscles in a cubic metre of blood always falls in a short time after the operation till, in from 150 to 200 days, it is less than half the normal number. After twelve months there begins a gradually increasing proportion of abnormally small red corpuscles, while those of exceptionally large size, some of which are always found in normal dog's blood, entirely disappear. The white corpuscles show no morphological change; their absolute number is sometimes increased, sometimes diminished. In one case, after 182 days, most of the lymphatic glands were found enlarged, softer than the normal, and red on section, especially in the cortical layer, the color depending mainly on red blood-corpuscles which were abundant in the lymph-channels of the gland, but being partly due to deposits of brownish-red pigment, the *detritus* of broken-down corpuscles. The marrow in the central cavity of nearly all the long bones was red-colored, the coloration being due to red corpuscles lying outside the blood-vessels in the spaces of the proper marrow-tissues. Later, similar but less marked divergences from the normal structure were found in both the lymphatic glands and the bone-marrow. Transfusion of the blood of a dog which had undergone splenotomy produced similar effects in the lymph-glands and bone-marrow of another dog.

Measrs. R. H. Ohittenden and J. S. Ely have made a series of experiments to ascertain the amount of alkali present in normal mixed human saliva, and whether the alkalinity is subject to

variation in different persons and at different times, and, if so, whether there is any connection between variations of alkalinity and the diastatic action of saliva. More than fifty specimens of the saliva of fourteen persons were examined. The average alkalinity of the samples expressed in the form of sodium carbonate was .080 per cent. The average diastatic action of fifty-four samples expressed in the percentage of sugar formed from the starch was 42.82 per cent. An examination of the individual results obtained showed several interesting facts, which may be summarized as follows: 1. Saliva from different individuals may show a constant difference in alkalinity, although in the majority of cases the alkalinity varies only within narrow limits; 2. Saliva secreted by the same individual at different times has within certain limits a constant degree of alkalinity; 3. While saliva from different individuals shows in several cases a decided and constant difference in alkalinity, there is no corresponding difference in diastatic action which is at all constant. We are thus forced to the conclusion that the variations of alkalinity are within too narrow limits to exercise any appreciable influence on the diastatic action of the saliva.

Béchamp has investigated the origin of the power possessed by human saliva of saccharifying starch-paste—a power which the saliva of many animals, including even such herbivores as the horse, has not. He concludes that it is not due, as some have thought, to chance germs which have entered the mouth from the atmosphere, but to a special ferment more active than diastase, and that it is produced by the action on the pure secreted saliva of specific microscopic organisms living in the salivary glands and in the mouth-cavity of man. The pure parotid saliva of horse or dog does not convert starch-paste into copper-oxide-reducing substances, nor does it acquire this power when exposed to the air, or when gently warmed with scrapings from the tongues of those animals; but it becomes very efficacious when scrapings from the inside of the human mouth are added to it.

E. Jessen has made investigations respecting the time required to digest meat and milk prepared in different ways: 1. With artificial gastric juice. Of twenty-five grammes of beef in each condition, at the end of twenty-four hours: 5½ grammes of the raw, from 9¼ to 9½ grammes of the half-cooked, and from 17 to 18 grammes of the well-done beef remained undissolved. 2. In the stomach of a dog. The raw meat was also digested more quickly than boiled or roasted meat, the time required for raw beef being from 5.3 to 5.5 hours. 3. Experiments were made upon man by introducing 100 grammes of meat and 800 c. c. of water into an empty stomach, pumping out the contents of the stomach after a time, and examining them with a microscope. The time required for complete digestion was as follows:

	Hours
Raw beef, shaved fine.....	3
Half-done boiled beef, shaved fine.....	2½
Well-done boiled beef, shaved fine.....	3
Half-done roasted, shaved fine.....	3
Well-done roasted, shaved fine.....	4
Raw mutton.....	2
Raw veal.....	2½
Raw pork.....	5

In the experiments with milk, a quantity was given, the amount of nitrogen in which would correspond with that contained in 100 grammes of beef. This with cow's milk was 602 cubic centimetres. That quantity of the raw milk was digested in 3½ hours; of boiled milk in 4 hours; of sour milk in 8 hours; 675 c. c. of skimmed cow's milk were digested in 3½ hours; 656 c. c. of raw goat's milk in 3½ hours.

The Physiology of Voice.—Prof. T. Wesley Mills, of McGill University, has published the results of examinations which he has made with the laryngoscope and tested by autolaryngoscopy upon certain controverted questions of the physiology of the voice. The questions embrace the functions of the epiglottis in changes of pitch and of quality, the influence of the trachea and of the supra-glottic chambers on pitch, the falsetto voice, and the registers of the singing voice. On the first point Mr. Walton has maintained, in a paper published in 1878, that “the epiglottis was seen to take different positions in changes of pitch, quality, and intensity.” Prof. Mills, remarking that this author and others have made the mistake of considering the movements of the epiglottis as essential when they are only incidental, concludes from his own observations that “the epiglottis may act like a resonator, and probably is one in some degree; that by its movements it is a modifier of the quality of sounds, but not appreciably of their pitch; but that the question as to how far the mere presence of the epiglottis independently of its particular movements may influence these qualities of sound is not as yet determined in the human subject.” Concerning the influence of the trachea on pitch, “it is a matter of commonest observation, that above a certain point in the scale (which latter varies with sex, age, and the individual), the larynx rises or falls according as the pitch is above or below this fixed point, which has been named the ‘station-note.’” It appears from the experiments that, while the breath-pressure is almost if not quite sufficient of itself to account for the rise of the larynx and trachea, it does not explain their fall below the position for the “station-note”; and for the efficient action of the arytenoid and cricoid cartilages in particular, and to effect a state of support and tension generally in the larynx, certain muscles, including the thyro-hyoid, the palatopharyngeus, and the inferior constrictor, act in harmony. Helmholtz gives no favor to the view that the supra-glottic air-chambers can alter materially the tones of the vocal cords. Notwithstanding this authority, and a few experiments that are cited as bearing apparently against his view,

Prof. Mills holds that these chambers do constantly exercise an important influence on pitch, and supports his position by citing observations or experiments which almost any one may test for himself. Thus, while all the other conditions are unchanged, by passing suddenly from the arrangement of the supra-glottic parts suited to the utterance of *o* (as in "note") to that form of the parts requisite to sound *e* (as in "me"), a change of pitch will be noticed which the most indiscriminating ear can not fail to appreciate. The same experiment may be repeated in view of the laryngeal mirror, when a change of pitch will be made without any noticeable change in the glottic appearance. Again, if the vowel *a* (as in "say") be sung at about the pitch of common conversation, or rather higher, and a musical instrument sound the note which seems best in accord with it, a departure from the note by even half a tone will be found to alter slightly the sound of the vowel. Hence, in accounting for pitch we must take into consideration the condition of the supra-glottic apparatus as well as the behavior of the larynx. The term falsetto voice is used to designate a certain quality of the voice not distinguished from the natural voice by any fixed line, but overlapping with it through a series of notes that can be produced by either. The essential conditions in the production of this quality are closure of the glottis posteriorly to a variable extent, depending largely on the pitch, but somewhat different in extent in different individuals; the force of the blast; and the manner of blowing. Variable conditions are the compass of the falsetto; the extent to which the vocal bands approximate posteriorly, and especially anteriorly; and the perfection with which the vibration of the segmented portion of the vocal cords can be effected. Almost precisely the same conditions apply to the head-voice production in females. A vocal register is defined by Garcia as "a series of consecutive and homogeneous sounds, rising from the grave to the acute, produced by the development of the same mechanical principle, the nature of which essentially differs from any other series of sounds equally consecutive and homogeneous produced by another mechanical principle." Garcia and Madame Seiler divide the registers into the chest and the head register, with the falsetto interposed between them. Madame Seiler makes a further division, and physiologically describes the registers as follows: *a*. The first chest-register, in which the whole glottis is moved by loose vibrations; *b*. The second chest-register, in which the vocal ligaments alone act; *c*. The first falsetto, in which the edges alone of the vocal cords vibrate, but the whole glottis is in action; *d*. The second falsetto, in which the edges of the vocal cords only are used, and the vocal ligaments alone are in action; and, *e*. The head-tones, in which the edges alone are vibrating while the ligaments are partially closed posteriorly. Prof.

Mills accepts the division and definitions, as to essential points, after having tested them on fifty subjects. In conclusion, he suggests that most writers on the physiology of voice appear to have attached too little importance to the wind-force apparatus and its action. Every trained singer knows, or should know, that correct breathing is, of all things, the most important in healthy and efficient vocalization. The chest production, the head-voice so called of males and high falsetto, cause in the subject sensations very different, part of which are referable to the larynx and to the wind apparatus. It is a matter of observation that more breath-force is required to produce a chest-tone than a head-tone of the same pitch, and less for the corresponding falsetto than for the head-tone. But that there is some difference in the manner of blowing that is essential to a good achievement in these different productions is capable of proof by experiment on one's own person.

Formation of Urea.—To determine in what part of the animal organism urea is formed, W. von Schroeder has made a series of experiments in which blood was caused to circulate through living organs, the amount of urea contained being determined both before and after its passage. An experiment on a dog after the kidneys had been extirpated showed that urea still accumulated in the blood. Ammonium carbonate was added to a specimen of blood, which was then passed through an ox-kidney, but afterward showed no increase in urea. Like experiments with dogs' kidneys gave the same result. Hence it was concluded that the kidneys are incapable of converting ammonium carbonate into urea. Experiments were also made with the livers of dead dogs into which blood was injected by the portal vein and taken out from the vena cava above the diaphragm. In one experiment, blood to which ammonium carbonate had been added contained before injection .0442 per cent. of urea, after the injection .0812 per cent.; in another experiment the increase was from .0538 to .1258 per cent., the solid matter in these cases having only slightly increased. Blood without the addition of ammonium carbonate was then passed through the liver of a hungry dog, and through that of one killed during the process of digestion. No perceptible increase in urea was noticeable in the former case, while in the latter the content of urea rose from .0499 to .0686, showing that the liver is able to produce urea from some substance formed in digestion.

The method of the formation of urea from ammonium carbonate, Von Schroeder holds to be by the loss of water.

Further light has been thrown upon the formation of urea in the body by the researches of E. Salkowski in regard to the behavior of several amido acids. The sodium salt of met-amido-benzoic acid was given to rabbits and dogs in quantities of two to ten grammes a day. In the urine of the rabbits 5 per cent. was ob-

tained as uramido-benzoic acid, and in that of the dogs nearly 20 per cent. Thus is rendered probable another example of a synthesis by the addition of cyanic acid within the animal body, since under the conditions which there prevail no other mode of formation for uramido acids is yet known. To ascertain in which organ uramido-benzoic acid is formed, Salkowski experimented upon a rabbit from which the kidneys had been extirpated, and found the acid in the blood, liver, and muscles. Ligaturing the ureters caused no increase in the amount of acid found. It is, therefore, evident that uramido-benzoic acid is not formed in the kidneys, and, since Von Schroeder has found that ammonium carbonate is converted into urea in the liver, it is probable that the former process is also carried on there.

Physiological Literature.—The year's list of new publications is not distinguished by the presence of any book of great importance in physiology. A considerable number of volumes and papers have appeared, particularly in Germany, where this work has been most industriously carried on, embodying the results of special studies, but little is to be found in them that adds materially to our knowledge of general principles, or points to any startling discovery.

Among the American publications of more general interest are Brubaker's "Text-Book of Physiology"; a translation, by Meade Smith, of L. Hermann's "Experimental Pharmacology"; and Dr. Gradle's (Ohio) treatise on "Bacteria and the Germ-Theory of Disease." Mallet has published a paper on the "Determination of Organic Matter in Potable Water." White has discussed the question, "Is the Blood a Living Fluid?" R. S. Henry has reported upon his new studies in the "Crystallization of Hæmoglobin." Chittenden and Ely have investigated the "Alkalinity and Diastatic Action of Human Saliva." We notice also monographs, all embodying the results of experimentation, by M. L. Holbrook on the "Termination of Nerves in the Liver"; Minor on "A Case of Color-Blindness for Green"; Mybridge on the "Attitude of Animals in Locomotion"; Mitchell and Reichert on the "Venom of Serpents"; and Sternberg on the "Germicide Value of Certain Therapeutic Agents, and on the Micrococcus of Gonorrhœal Pus."

The English list furnishes a fourth edition of Dr. Michael Foster's "Text-Book"; a translation, by McAlister, of Ziegler's "Text-Book of Pathological Anatomy and Pathogenesis"; Coats's "Manual of Pathology"; Klein's "Histology"; Malley's "Microphotography"; studies by Wells on "Indian Snake-Poisons"; Lawes, Gilbert, and Warrington on the Chemistry of the "Fairy Rings"; Pavy, Johnson, Rolfe, and Oliver, on "Urinary Tests and Tests for Albumen"; Elsberg, Bower, and Gardiner, on "Protoplasm"; Geddes on the "Cell Theory"; Harris, Norris, and Ray Lankester, on

the "Blood"; Gaskell on the "Function of the Cardiac Tissue"; Huddicombe on "Respiration"; Budwin on the "Supposed Poisonous Alkaloid in Human Saliva" (in which he contradicts some conclusions of Gautier); Garrod and Cook on "Uric Acid"; Stone on the "Influence of High Temperature on the Electrical Resistance of the Human Body"; L. Brunton on the "Nature of Inhibition, and the Action of Drugs on it"; Poulton on the "Origin of Taste-Bulbs"; Stone on "Singing, Speaking, and Stammering"; Brown on "Photography of the Larynx and Soft Palate"; Blomfield, Dowdeswell, and Wiltshire, on the "Reproductive Organs"; Ringer on the "Effects of Dilution and Concentration on the Action of Poisons"; Lauder Brunton on the "Temperature-Modifications of the Action of Drugs"; Dowdeswell on the "Action of Papaine with reference to the Occurrence of Micro-Organisms in the Blood"; Ringer and Sainsbury on the "Action of Chloral, Opium, Bromide of Potassium, and Barium Chloride"; Williams on "Experiments upon Bacteria with Disinfectants"; Klein and Ray Lankester on "Bacteria"; Crooke on "Bacilli in Scarlet Fever"; and by Cheyne, West, Gibbs, Smith, Williams, Green, and Dreshfield, on the "Bacillus of Tubercle." New apparatus have been described by Shenstone, Vacher, Glazebrook, Thelfall, and Warner.

The German list includes four hundred and thirteen titles, and a small number of papers in French are registered.

PITA. The pita-plant differs from an aloe proper (the European aloe belongs to the lily family), and also from the cactus, with both of which it has been confounded. Richard Whiteing speaks of the planters of Mauritius cultivating it for its valuable fiber, and names it a species of aloe (*Aloe Mexicana*); and Dr. Trowbridge, United States consul at Vera Cruz in 1880, said, in speaking of a variety of this plant, if not actually the same species: "There is a species of cactus here commonly called 'pita,' some of the fibers of which are sixteen feet long. It is strong and silky, and capable of being drawn into threads, from which gossamer webs might be woven. In fact, a few months ago, a Vera Cruzan sent some of the fiber to England, and had a few handkerchiefs made, which were extremely beautiful, and appeared more like silver tissue than linen, and were quite strong." Pita is generally known as the American aloe or agave-plant (*Agave Americana*). It belongs to the amaryllis family, and has been put to a great variety of uses in Southern Mexico and the several republics of Central America. The dried flower-stems have been extensively utilized to make thatched roofs for tropical houses, the strength of the fiber giving to such roofing a wonderful durability. The sap of the leaves of one species of the American aloe (coarser than the one which is the subject of this article) becomes, when fermented, the well-known

Mexican drink, *pulque*, and, when distilled, the pleasant but deceptive *vino mescal*. The fiber, which is the most valuable and wonderful quality of the pita-plant, has been extensively used by the natives for shoe-strings, hammocks, and cordage. It extends the entire length of

PITA PLANT (*AGAVE AMERICANA*).

the leaf, and has been extracted by first pounding the leaf on a rock, then exposing it to the rays of the sun, whereby the bark of the leaf became crumbled, and a second pounding, followed by combing, produced the clean fiber. This process is necessarily slow and expensive, which accounts for the fact that the use made of this fiber has been entirely confined to the tropical countries producing it.

The pita-plant of Central America seems to yield a finer fiber than that of Mexico; but there is a marked difference, in this particular, in localities on the same parallel. In the lowlands of Honduras and Nicaragua, where pita grows most luxuriantly, the leaf is straight, from three to four inches in width, having no middle stalk, and from a few feet to eighteen feet in length. In its growth there, it monopolizes the soil, taking exclusive possession—excepting, of course, the tropical forest-trees. From the fact that this plant has, as yet, received no systematic cultivation or cutting, it is impossible to determine the exact annual yield; but, from the best sources which present themselves, this yield (by cutting the leaves three or four times a year, so as to bring up an average of six feet in length) will be from three to five tons of clean fiber per acre. The territory occupied by this plant is exceedingly extensive. Along some of the water-courses, and extending back from them, single tracts of 1,000 acres can be found.

The crude fiber is equal in value to Manila hemp, when applied to like uses; but in fineness, strength, and durability, it is superior. The ultimate fiber is even finer than that of

the threads of silk spun by the silk-worm. The writer of this was shown the two under a powerful microscope at Lyons, France, and heard many exclamations of surprise by manufacturers at the unexpected result; and in discovering also that pita-fiber did not lose its strength when reduced to the floss state. Experiments have been made in weaving this fiber when flossed, with cotton, wool, or silk; and it has been found that this can be done advantageously with each of them. As the pita-fiber possesses a silky gloss of its own, it has been thought by manufacturers that it would be found valuable to mix with silk, especially in the manufacture of heavy fabrics where weight, strength, durability, and finish are required. It is the strongest vegetable fiber known. Companies have been organized in New York recently to reduce this pita-plant into fiber, and to introduce machinery to this end. One company has put up a factory during the past year on Black river, Honduras, a short distance from the port of Hiriona. Near this point and along this river are extensive fields of pita. The company's works comprise a saw-mill, shops, other buildings, steam-power, and a small steam-tug on the river to tow pita to the factory, and it is now testing various machines, recently invented. A wide field seems here to open itself to the inventor. Years of patient work of inventive brains were required before proper machinery was perfected to produce ramé-fiber from the stalk; and some waiting may still be necessary before a practical machine shall be completed, capable of reducing the green leaf of the pita-plant to a marketable product.

PORCELAIN. This name is said to have been given by Europeans to the finest wares of China, from the resemblance of their fine polished surfaces to that of the univalve-shell which bears the name of *porcellana*; and the shell itself derived its appellation from the curved or gibbous shape of its upper surface, which was thought to resemble the raised back of a *porcella*, or little hog—as we should say, pig. Other explanations of the origin of the name have been given, as, for example, from Count Portocellani, the French ambassador, who was so much interested in ceramics; or by a corruption of *pour cent an* ("for a hundred years"), the Chinese claiming that the dough or paste was suffered to ferment for a hundred years before it was molded. But the first seems the most probable derivation.

We shall confine ourselves in this article to that class of ceramic wares known under the general name of porcelain, and to these mainly as produced in the United States.

The best writers on ceramics divide porcelain into two classes, "hard" and "soft"; or perhaps, more exactly, "natural" and "artificial." Both kinds are spoken of as translucent, though the translucence in the thicker wares is not very obvious, except as distinguishing it from the dull opacity of the wares having an earth-

en body. Natural or hard porcelain is made of pure kaolin, feldspar, and silica usually from the finest powdered quartz; no trace of iron or other metals is permitted in its composition. The glaze is of the same materials as the body, though in different proportions, and with the possible addition of a little lime or chalk to make it flow more readily. The finest and best qualities of this natural or hard porcelain owe their perfection and comparative indestructibility to the methods of baking or firing. All glazed fictile wares require two bakings or burnings, and, if decorated after glazing, a third, to fuse and fix the metallic colors. In the production of hard porcelain, the first baking, by which the molded material is brought into the condition of biscuit-ware, is conducted in the upper story of the great kilns, where the heat is not so intense as in the lower story, and seldom reaches more than 1,800° Fahr., and in the case of the thinner wares is even less. The biscuit-ware thus produced is porous, somewhat friable, and can be turned perfectly smooth in a lathe. When ready for the glaze, which is an impalpable powder, kept suspended in a large tub or vat of water by constant stirring, it is plunged into it, and, from its porosity, absorbs the water, leaving the glaze in a fine, pasty powder on the surface. It is dried in the air, and then carefully packed in the seggars and placed in the lower story of the kiln, where it is subjected to a heat of from 4,500° to 5,000°, the later stages of the baking being carefully watched, and the temperature reduced at the point where the glazing begins to flow freely, and the body is so far vitrified that body and glaze form a homogeneous mass. The porcelain is suffered to cool gradually, and is not taken from the seggars under four or five days. When taken out, it is pure white, translucent, not readily frangible, and, when broken by a sharp blow, is found to be perfectly homogeneous in its composition, so that it is impossible to tell where the glaze ends and the body begins, and there is no danger of chipping, crazing, or cracking of the glaze, or absorption of grease or acids. The glazed porcelain and biscuit-wares of China, Japan, Dresden, Berlin, Sèvres, and Limoges, and of the Union Porcelain Works in Brooklyn, N. Y., belong to this class of natural or hard porcelain.

The soft or artificial porcelain differs from this in very many particulars. Miss Young, in her work on "The Ceramic Art," makes three subdivisions of artificial porcelain, some of them of great beauty, but all fragile and possessing qualities which, for most purposes, render them undesirable. The first subdivision has the body of alkaline paste—some kaolin, but, mingled with it and the feldspar, is very nearly an equal quantity of bone ground fine; the phosphoric acid from which, combining with the other ingredients, makes the paste alkaline, and, when baked, translucent but fra-

gile. The glaze is also alkaline, and is composed of feldspar, carbonate of lime, borax, and white-lead. Sometimes silica and pearl-ash (bicarbonate of potassa) are added to the ingredients of the body, to make it still more alkaline. The alkaline glaze may be either colored or colorless. To the former class belong some of the alkaline wares of Persia, China, and of Deck and Haviland—to the latter those of Persia, China, St. Cloud, Tournay, Sèvres, and Haviland. The old Sèvres statuettes in biscuit-ware also belong to this class of alkaline pastes.

The second subdivision of artificial porcelains includes those having a body of calcareous or chalky paste in which chalk and lime take the place of bone, and are combined either with kaolin or feldspar. The glaze of these is boracic and colorless. This includes English china, the Minton, Worcester, and Copeland wares.

A third subdivision is Parian wares, not glazed. The paste is mainly feldspathic, but its exact composition is variable, and in some cases secret. The paste for Parian wares is stiffer and more solid before baking than that of the glazed wares generally, and is always cast in molds. The Parian figures and statuettes of Copeland, and those of Minton and the Worcester potteries, England, are included in this subdivision.

It is to be noticed that not only is there this radical difference in the composition, both of the body and glaze of the artificial or soft porcelain, from that of the natural or hard porcelain, but there is a difference, as marked and as important, in the methods of baking or burning them. All of the soft porcelain wares are baked at a very intense heat the first time. The temperature of the biscuit-ware is raised to 4,000° Fahr., or higher, and they are cooled gradually for several days. The reasons assigned for this intense heat are various: where the body contains a large percentage of bone, the burning must be carried to a temperature high enough to destroy all traces of animal tissue in the bone, and reduce it to a pure phosphate of lime. When thus thoroughly burned, the body, though professionally infusible, is carried almost to the point of vitrification. In the case of Parian wares, they become so hard and dense that they can be rubbed, polished, or turned in the lathe, till they acquire a marble or ivory-like surface. With those wares which are to be glazed, there is the still more potent reason that the alkaline and boracic glazes will become vitrified at a much lower temperature than that to which the body has been subjected. This is still truer of all the plumbiferous or lead glazes, which, however, are not used to any considerable extent in the true soft porcelains, or *pâtes tendres*, of Europe.

When these wares are glazed, they are subjected to a heat varying from 800 to 1,200 Fahr., and the glaze flows over the wares, forming a

brilliant glass covering for it, but one not homogeneous with the body, and liable to crackle, craze, or chip off, on being subjected to a moderately high heat, or intense cold, the expansion and contraction of the body and glaze being different. For many purposes of fictile art, these wares are very beautiful; they may be made so thin and delicate, and the glazing so brilliant, that they will resemble the finest translucent and egg-shell porcelains of China and Japan, and when artistically decorated they have an exquisite effect; but they are very fragile, and, if exposed to great changes of temperature, their beauty is destroyed.

Below these in quality, and not meriting the name of porcelain, either natural or artificial, are the great variety of *faïences*, with the body earthen, of a white or colored clay (not kaolin or feldspar), and a transparent glaze, usually largely plumbiferous, though sometimes alkaline, which may be either colorless or colored. Still below these wares, having an earthen body with a non-vitrified break, are those which have an opaque glaze, or rather enamel, usually of some of the salts of tin, and either colored or colorless. To these two latter classes belong the Henri II *faïence*, the Wedgwood-ware, and the Meakin, Ceoil, Montereau, Palissy, and Nuremberg *faïences*, and Minton's majolica. These all have lead or stanniferous glazes.

The *faïences* of Persia, of China and Japan, and of Deck, have all a colorless alkaline glaze, while the Limoges *faïences* of Haviland, Bracquemond, and Chaplet, are colored, though still alkaline. The opaque earthen-body wares, with an opaque stanniferous glaze, include the Della Robbia, Rovigo, Fontana, Rouen, Moustiers, Nevers, Delft, Ulysses de Blois, and St. Clement wares, all of which have had in their day, and some of them still retain, a high reputation.

These *faïences*, Wedgwood, and Delft wares, only concern us in the present article from the development of porcelain manufacture from these lower grades of pottery wares, and especially in this country.

Porcelain, in the true meaning of the term, originated in China. There is conclusive evidence that it was manufactured there at least 1,800 years ago. From China it was introduced into Persia, Egypt, and Barbary, at a very early period, and into Japan from the thirteenth to the fifteenth century. It was introduced into Europe about the beginning of the sixteenth century. The artificial or soft porcelain, *pâte tendre*, was the first to be produced there. It is said that a Venetian potter made porcelain about 1520; but no specimens of it are now known. The first success of which there are substantial evidences was at Florence in 1580. In 1671 Dr. Dwight, of Fulham, England, made an independent discovery of the process, and manufactured it there. In 1695 M. Chicanneau made a similar independent discovery at St. Cloud, France. These and many other manufacturers in Europe made only soft porcelain, using white clay, bone, etc.,

for the body. Kaolin was as yet an unknown earth. About the year 1709 a bed of kaolin was accidentally discovered at or near the village of Aue, near Schneeberg, in Saxony.

John Frederick Böttger, or Böttcher, a chemist's assistant at Berlin, had fallen under the suspicion of the government as an alchemist, and, about 1706, took refuge in Saxony, under the protection of the Elector Augustus II. The

FIG. 1.

Electeur questioned him, and, being satisfied, placed him in the laboratory of a chemist, who was endeavoring to discover the "Philosopher's Stone." Here Böttger surprised himself by producing something akin to Chinese porcelain; and the Electeur gave him every facility for prosecuting his experiments to that end. He was established at first at Meissen, then at Königstein, and finally at Dresden. His first results were comparatively rude; then he succeeded in producing a reddish stone-ware, and afterward a dull-white porcelain. At this time, Hans Schnorr, a wealthy iron-founder, while riding near Schneeberg, noticed that his horse lifted his feet with great difficulty. On examination he found that he was passing through a bed of clay, which was very white and peculiarly adhesive. At that time hair-powder was in great demand, and was very dear. Herr Schnorr conceived the idea that this clay might be made profitable, as a cheap substitute for it. He tried the experiment, and was successful.

In due time, the new hair-powder came under the notice of Böttger. He found it was an earth, and at once tried it in his laboratory. It was kaolin, and he had discovered the material for making hard porcelain.

Kaolin of inferior quality was discovered at Alençon about 1760, and a hard porcelain made from it, which was not pure in color. In 1765 the wife of a surgeon found a bed of

FIG. 2.

a peculiarly soft earth, of remarkable whiteness, near St. Yrieix. She was poor and economical, and thought, from its soft, oily feel, that it might answer all the purposes of soap. Her husband sent a sample to a chemist, and it was soon decided to be kaolin. The manufacture of hard porcelain was begun at Sèvres in 1769, and both the kaolin and petuntse (quartz and feldspar) were supplied from the quarries of St. Yrieix. Sixty years later, in 1825, the surgeon's widow, Madame Darnet, who had made this great discovery, and whose life had been spent in poverty, received a small pension from Louis XVIII. There are porcelain factories elsewhere in France, but those of Sèvres and Limoges still retain the pre-eminence they have held so long. Most of the pieces produced at these great establishments are decorated. Artificial porcelain is not now made extensively in France, but in its place, Palissy, and, in our own time, Haviland, at Limoges, have by their genius raised *faïence*, a ware of inferior material, to a place beside the finest of natural porcelain. This has been accomplished by the careful working of their material, the beauty and grace of the designs, and the high art manifested in the ornamentation, the decorations being generally beneath the glaze or enamel.

In Germany, hard porcelain is made at Meissen and Berlin, on a very extensive scale, and at Dresden and other points in smaller quantities. It is also produced, of excellent quality and great beauty, in Vienna.

Italy and most of the other European states, though they formerly made some hard porcelain, now content themselves either with *pâte tendre*, or oftener with *faïence* and *majolica*, some of their wares being of great beauty.

There were in the latter part of the last cen-

ture two and possibly three places in England—Plymouth, Bristol, and perhaps Lowestoft—where hard porcelain was made for a few years. There are none now in the United Kingdom, though an exceptional ware from Belleek, Lough Erne, Fermanagh county, Ireland, approaches more nearly to the egg-shell china of the East than any other produced in the British Isles. The so-called china or porcelain of Great Britain is either artificial porcelain, in which bone largely predominates, or wares of cheaper white or colored clays, mixed with bone, known there as granite, Wedgwood, Staffordshire, etc., which in their finer specimens and tasteful decoration belong to the class known as *faïence* on the Continent.

In this country the first demand is for articles of domestic ware which, while in graceful forms, shall be plain and serviceable.

We have but one manufactory of hard porcelain, the Union Porcelain Works, at Greenpoint, Brooklyn, N. Y. These works only date from 1868, in their present development and ownership. There had been three or four previous attempts at its manufacture: one in Philadelphia, about 1770; one by William Ellis Tucker and his several partners, between 1820 and 1838, also in Philadelphia; one in Jersey City, and several small establishments for making porcelain hardware in Greenpoint, Long Island, between 1848 and 1862. These all failed, and Thomas C. Smith, an architect and builder, of New York city, was almost driven into the business, in 1863, by the failure of the last of them, to which he had loaned large sums. The disasters of the earlier years of the civil war had made them bankrupt, and Mr. Smith, their principal creditor, had gone to Europe for his health, when he received intelligence, at about the same time, of their fail-

FIG. 3.

ure and of the disastrous second battle of Bull Run, the darkest hour in the long struggle for the Union. In spite of this, he resolved to undertake the porcelain manufacture; and after a close examination of the Sèvres manufactory, and an equally careful investigation of the Staffordshire potteries, he decided that he would only make hard porcelain. His large fortune,

acquired by more than twenty years of arduous toil, was freely expended, and the result, after twenty years of hard work, has been a great success. After two years of experiment, and many disheartening failures, he succeeded, in 1865, in placing upon the market a plain white ware, while he continued his manufacture of articles of porcelain hardware, which at first brought him some profit, when everything else involved loss. In 1866 he began to decorate his wares, employing one English and one German artist. His first attempts in this line were not a pronounced success; but he avoided the too common error of copying foreign designs. All his designs and decorations are original, and this is true also, so far as possible, of the forms of his wares.

We give illustrations of one of the vases and a few of the plaques and plates made at these works. Fig. 1, "The Century Vase," was made for the Centennial Exposition. The engraving gives only one side, and but a partial view of its symbolic designs, which compass the century's history. Fig. 2 is a plate with the design of a windmill, painted by Mr. J. M. Falconer. Figs. 3 and 4 are more characteristic of the Greenpoint Porcelain Works, the designs being from actual flowers, and made

FIG. 4.

by their own artists. The Union Porcelain Works now cover about two acres, and each year new buildings and new kilns are required. They employ more than 200 hands, and pay very liberal wages. The other fine pottery-wares made in this country are not easily classified. In the number of its pottery establishments, of all sorts, Ohio exceeds any other State, reporting, in the census of 1880, 179 manufactories of earthen and stone ware;* but New Jersey, which had but 49 potteries, exceeded it in the value of its product by nearly \$500,000. The best products of the Trenton (N. J.), Cincinnati and East Liverpool (O.), and Chelsea, East Boston, and Cambridge (Mass.) potteries demand some notice. Of these

* By this term the Census-Office designates all kinds of pottery, from the rudest, unglazed flower-pot to the finest decorated porcelain vase.

fifty or sixty establishments, the greater part manufacture what is known as white granite-ware, though some add to this cream-colored wares. This was an advance on their original product which was known as "C. C. ware." Several of the Trenton potteries have, within the past few years, made a still further advance, to what they call "opaque porcelain," which is really analogous to the English and French *faïence*. The body is of white clay, with some kaolin, and perhaps feldspar also, but is never a pure kaolin, feldspar, and quartz body. The glazing is claimed to be feldspathic, but containing some borax, and perhaps also lead. Following the example of the great masters of *faïence* in Europe, they have made the designs for these wares very beautiful, and have decorated them with great artistic skill. Of their class, they are very fine examples, but they are fragile, and, from the inherent fault of their baking and glazing, are not homogeneous, and are liable to chip and craze. This liability is of less consequence in fancy pieces, and those which are only designed as specimens of high art; but in household wares it is a very serious objection, and one which they are struggling to the best of their ability to overcome. One of the Trenton companies, the Etrurian Pottery Company, has devoted several of its kilns to the production of Parian wares, and what it calls ivory porcelain. The latter has a hard, semi-translucent body, and a clear, smooth, boracic glaze. The body probably contains some kaolin and feldspar, and perhaps also bone. It is an approach to the English *pâte tendre*, but does not reach it. The Parian is cast in molds, and has a hard surface, not glazed.

The Greenwood Pottery Company, of the same city, are manufacturing an article which they call "porcelain," or "American china." It is probably a near approach to the English and Viennese soft porcelain, but is not quite equal to it. They are now suffering from the intense competition of the Viennese manufacturers, who have thrown upon our markets a soft porcelain, which is of excellent quality and of fabulous cheapness.

PORK, PROHIBITION OF AMERICAN. Between 1879 and 1881 nearly all the governments of continental Europe restricted or completely interdicted the importation of American hog-meat. The first action of the kind was taken by the Italian Government. In consequence of alleged frequent discoveries of trichinæ in pork coming from Cincinnati, the sanitary department of that government issued an order on Feb. 20, 1879, prohibiting all pork imports from the United States. The prohibition was extended on May 6, 1879, to all foreign pork. About September, 1879, the Council General of Public Health in Hungary caused a similar interdict to be issued in that country. At the same time the Austrian and Hungarian governments consulted with regard to making the prohibition of American pork, on the ground of the prevalence of trichinæ

in the United States, general throughout the Austro-Hungarian Empire. By an imperial decree, promulgated Jan. 25, 1880, Germany prohibited the importation of chopped pork and sausages. On Feb. 18, 1881, the French Government, on the ground of the detection of trichinæ in pork from the United States, issued an order, on the advice of the Consultative Committee of Public Health, forbidding imports of salt pork from America. The Governments of Greece and Turkey were actuated by the French report and prohibitory decree to adopt a like measure. The Austro-Hungarian authorities, which had the question under consideration since 1879, issued on March 10, 1881, the most stringent interdict yet adopted, prohibiting the importation of pig flesh, lard, sausages, and all pork products from the United States. The Swiss and Belgian governments were petitioned to enact prohibitory regulations for hygienic reasons, but they refrained from such action. An agitation was started in England against American pork early in 1880, caused by reports from British consuls with regard to the prevalence of hog-cholera in the United States, the slaughter of diseased animals, etc. The excitement led to no prohibitory legislation, but imports of live hogs and pork products were checked for a time.

The action of foreign governments in prohibiting American pork imports was based originally on sanitary grounds. The impression that trichinosis was exceptionally prevalent in the United States was at first general. The pork-producers in European countries, from interested commercial motives, put forth every effort to spread and confirm this belief. Reports from consular officers and American authorities regarding the prevalence of disease, the lack of official inspection in the pork-packing establishments, the dishonesty of packers, who were accused of killing diseased and maimed hogs, and even of packing those which died from natural causes, were assiduously circulated. The influence of this powerful class was exerted to induce the governments to adopt or maintain prohibitory measures. The question, therefore, soon assumed a protective commercial aspect, and the later decrees were framed in this sense, though not avowedly so. Thus the Government of Germany, on Feb. 21, 1888, issued an edict prohibiting all descriptions of swine-meat, including hams and bacon, which were exempted from the interdict of June 25, 1880. Canned hog products are likewise excluded, although in their preparation they are subjected for several hours to a temperature above the boiling-point. The restrictive measures interfere with the trade with other countries which use the German railways, since the transportation across German territory of pork in transit and in bond is also forbidden, although ample provisions exist for the security of such traffic. The authorities of the free ports of Hamburg and Bremen were unwilling to adopt the restrictive measures, but,

after the issue of the last decree, they yielded to the pressure of the Imperial Government and adopted the same measure of total exclusion. By the action of the Board of Trade and Navigation of the city of Hamburg, no American pork is allowed to be landed, except, under strict supervision, for re-export, or as provisions for vessels lying in the harbor. The ordinance was enacted April 21, 1888.

The question of trichinosis in American pork was first raised in Germany in 1878, and a medical commission was appointed to investigate the subject and advise the Government whether it was necessary to subject imports of swine's meat to microscopical examination. The importation of American pork at that time was enormous. American hams were purchased in large quantities and subjected to a process of preparation, principally at Güterslohe, and then sold as Westphalian hams. The medical experts reported that twenty instances of trichinosis in American pork had been discovered, twelve in hams, at Bremen. The board advised microscopical inspection. The reason why the German Government directed its attention at that time to American pork was because it had recently perfected its system of official inspection of pork, as well as meats of other kinds, and other articles of food. The danger from trichinosis in that country is greater, and deaths from the disease more frequent, than elsewhere, because the habit of eating smoked hams and sausages in an uncooked state is common there. The absence of official inspection in the United States was complained of, and the sale of immense quantities of imported meat, which was subjected to no examination where it was slaughtered of the kind deemed necessary in Germany, and could not be easily or thoroughly examined there, was anomalous, and excited fear and misgiving. The growth and magnitude of the trade in American pork products was a subject of dread of a commercial character as well, and already affected prejudicially the interests of a class which has become more potent in German politics of late years. One of the features of Prince Bismarck's economical policy is the advancement of the interests of the land-owning class at the expense of the other classes of the community. The great landed proprietors of Pomerania and Silesia have distilleries on their estates, and fatten hogs with the malt-mash. At first there was no thought of depriving the people of the towns of so common, cheap, and important an article of food as American pork; but the "sanitary" theory was taken up eagerly by the interested class; petitions came in from the agricultural societies by hundreds, and finally, as in other similar matters, the wishes of the agricultural class prevailed. Thus the importation of live cattle had been interdicted—from Russia on the ground of rinderpest, from Holland on that of pneumonia and the epizootic, from Austria-Hungary on account of cases of rinderpest in

Hungary and Galicia. The acts were passed by the Bundesrath in virtue of powers conferred on it to adopt precautionary measures against the introduction or spread of disease. The Liberal parties, representing the industrial and commercial classes and the consumers of American pork, warmly opposed the restrictive measures. These would never have been passed by the Reichstag, but the latter has no power to rescind them, as the Bundesrath has authority to make sanitary regulations.

The United States Government, in view of the interdiction of American hog-flesh by European countries, proceeded to investigate the question of the alleged perniciousness of American pork. The Department of State ordered an inquiry in March, 1881, which was conducted by Michael Scanlon, Chief of the Bureau of Statistics of the State Department. The investigation covered trichinosis, hog-cholera, and other diseases of swine, methods of preparation for the market, etc. The asserted prevalence of hog-cholera was disproved, and it was shown that precautions were taken to prevent any but healthy animals from being brought to the packing-houses. The existence of trichinæ was detected in a number of instances, but the proportion was shown to be smaller than in other countries. The statistics of disease in the pork-consuming districts of the Western States, as compared with those of the rural districts of Central Europe, where none but native pork is consumed, show a much greater immunity from trichinosis. The report and the representations based upon it had no effect on the action of Germany and the other European countries. Upon the announcement, in February, 1888, that the Imperial Government was about to submit to the Legislature measures for the total exclusion of American pork, the American Government determined on a more exhaustive investigation of the subject, in the hope of averting such action, and announced to the German Government its intention to appoint a competent commission for the purpose, inviting it at the same time to send experts to inquire into the facts in relation to the supposed danger to health of American pork, either jointly with the commission or independently. The German Government declined the invitation, giving as the reason that in a matter of domestic sanitary legislation it could not enter into an arrangement which would imply an obligation to accept and be bound by a state of facts existing outside of its jurisdiction. The commission was appointed. It was composed of Prof. Charles F. Chandler, representing the New York Board of Trade; E. W. Blatchford, representing the Chicago Board of Trade; F. D. Curtis and Prof. D. E. Salmon, nominated by the Commissioner of Agriculture; and the Commissioner of Agriculture as chairman. The House of Representatives passed resolutions calling upon the President to furnish all documents and information relating to the restriction upon the importation

of American hog products into Germany and France, declaring it to be the duty of the Government to act promptly and with energy, since those governments had shown, by declining to send agents to test the healthfulness of those products, that the pretended sanitary reasons were not genuine. Secretary Frelinghuysen, in a communication to the President in response to the request to lay before Congress the diplomatic history of the subject, recommended that no retaliatory or other legislative action should be taken pending the report of the commission, stating that when the Government should be in possession of the proofs that American pork was not injurious to health, it could call upon foreign governments to remove the restrictions, as incompatible with the provisions of commercial treaties.

One of the incidents of the controversy is a coldness in the diplomatic relations between Germany and the United States. Minister Sargent, in a confidential letter to the State Department at Washington, explained the protectionist motives of the pork edict. The letter was published with the other documents of the State Department, and reproduced in the "New York Handelszeitung," from which it was republished in the "North German Gazette," which is a personal organ of Prince Bismarok, with offensive comments based on the pretended supposition that Mr. Sargent contributed the letter to the newspaper. From that time the American minister was the object of continued attacks by the semi-official press, and his social and official relations in Berlin were made so unpleasant that in March, 1884, he resigned.

In France the objections to American pork were, as in Germany, founded on the absence of the safeguards against trichinosis prescribed by law for native pork products. The discussion passed through several phases. After the promulgation of the restrictive edict a strong opposition was aroused to the exclusion of these cheap food imports. There had been no case of trichinosis from eating American pork within a long period. Men of science pronounced the meat innocuous. Politicians exerted themselves in the interest of the consuming public to have the interdict recalled. On the other hand, the producing interest was as important and politically active as in Germany. It was demonstrated that the parasite is destroyed by cooking, and that therefore, since the custom of eating partly cooked pork was far less prevalent than in Germany, the danger was slight, even from trichinosed meat. Various schemes of microscopic examination were considered, but they were all condemned as troublesome and costly impediments to commerce and insufficient safeguards against trichinosis. At length, in November, 1888, the Government repealed the prohibition. The subject was then taken up and warmly discussed in the Chamber. M. Paul Bert repeated the sanitary arguments, and expressed a fear that the dis-

ease would be communicated to French hogs through eating rats infected by American pork. The Chamber passed by a decided majority a resolution in favor of the continuance of the prohibitive regulation. The Government, in pursuance of this resolution, restored the interdiction on Jan. 20, 1884. In 1888 Portugal followed the other Continental countries in excluding American pork. In Austria, Hungary, and Italy, the prohibition was maintained.

Trichinosis in American Swine.—The various expert examinations which have been made under the orders of the Government have revealed the fact that a greater or less percentage of American hogs are affected with trichinosis. Prof. Dettmers, who was commissioned by the Agricultural Department to conduct an investigation in Chicago, found among several hundred hogs about 4 per cent. infected, but supposed that researches on a large scale would reduce the proportion to 2 per cent. The percentage in European countries is said to be much higher. Microscopic examinations of a thorough character had not been made previously to the appointment of the last commission. The investigators consulted the statistics of mortality, and found that the disease was very rarely communicated to human beings in the United States. Dr. J. B. Hamilton reported that among 284,858 cases of disease treated by the Marine Hospital Service in ten years, there was not one of trichinosis. In Cincinnati no well-authenticated case of the malady has been known. In the District of Columbia no case is recorded. In Boston, New York, Philadelphia, and Baltimore, among 850,072 deaths during the past five years, six resulted from trichinæ—three in New York and three in Philadelphia. The number of live hogs received in those cities during that period was 14,701,236, nearly all of which were consumed there. The late Dr. W. C. W. Glazier prepared a report on the natural history of trichina and the pathology of trichinosis, which was transmitted to Congress by the Treasury Department in December, 1880. He showed that the disease existed in Germany and France in 1880, which was long before it was known in the United States, and before American hog products were exported to Europe. He and the more recent investigators express doubts as to whether any of the cases of trichinosis in France and Germany are traceable to the use of American pork. The conclusion is drawn from the fact that the more recent cases in those countries were caused by freshly-killed native pork, that the noxious power of the parasite is destroyed by the processes of salting, smoking, etc., and by the time which elapses before American pork reaches the consumer. Cases which lately occurred at Ermersleben were ascribed at first to American pork, but it was proved that they resulted from eating native pig-meat freshly slaughtered. The methods of official inspection can not be applied in rural districts

to swine slaughtered for local consumption. All the experts agree that trichinosis can only result from uncooked meat. This is denied by German scientists, who assert that, in the ordinary processes of cooking, the temperature does not rise in the center of a large piece of meat to the point at which life is destroyed. The danger from trichinosis, it is suggested in the reports of the commissions, should so enlighten the German and other European peoples as to induce them to abandon the habit of eating raw pork. None of the reports recommend the introduction of a system of government inspection in the packing-houses.

Proposed Retaliatory Legislation.—It has been suggested, by legislators and by consular officers abroad, that the proper way to meet the restrictions placed on the importation of American pig-meat, is to place retaliatory restrictions on imports from the countries which refuse to receive this American product. It has been proposed to place discretionary power in the hands of the President to impose temporary restrictions to meet the case. It has been also suggested that restrictions could be made on similar sanitary grounds. The wines of France, which are notoriously sophisticated, would be almost entirely excluded by a regulation allowing none but pure, natural wine to pass the custom-house. The value of French wines imported in 1888 was \$5,295,856.

Pork Production of the United States.—According to the census, the number of hogs on farms in the United States increased from 25,184,569 in 1870, to 47,681,700 in 1880. The net weight of hogs slaughtered annually is estimated by Mr. J. R. Dodge, statistician of the Agricultural Department, at 5,250,000,000 pounds, which is the equivalent of 4,725,000,000 pounds of cured meats and lard. The estimated number of hogs in the United States in 1882 was 48,270,086, valued at \$291,951,221. Iowa stands first in the raising of hogs, the number on the farms of that State being returned as 5,107,445; Illinois coming next with 3,970,764; Missouri next, with 3,892,920; Indiana next, with 2,724,388; Ohio next, with 2,714,112; and then Tennessee, Kansas, Texas, and Kentucky, with nearly 2,000,000 each, equalled in weight and value of the product by Nebraska and Wisconsin.

The total number of swine in all countries is estimated at 91,964,000, of which number 47 per cent. are in the United States. The number in Germany in 1880 was returned as 7,824,000; in Austria-Hungary, 6,995,000; in France, 5,801,000.

In many States the quantity of pork produced is not sufficient for their own demand. It is estimated that 98 per cent. of the exports of pork and lard consist of the surplus products of Ohio, Michigan, Indiana, Illinois, Kentucky, Tennessee, Missouri, Kansas, Nebraska, Iowa, Minnesota, and Wisconsin.

The number of hogs packed for commercial purposes during the year ended March 1, 1888,

was 9,342,999, of which 4,222,780, or 45 per cent., were slaughtered and prepared at Chicago, 818,884 at Kansas City, 532,180 at St. Louis, 507,816 at Cincinnati, 405,519 at Milwaukee, 388,417 at Indianapolis, 327,163 at Cedar Rapids, and 218,885 at Cleveland.

The supply of pork depends on the corn-crop, and consequently varies greatly. The failure of the corn-crop in 1881 made pork very high in 1882. The supply of corn has been below the average since that year. The hostile foreign legislation has therefore not had the effect of bringing about low prices for swine products. The number of hogs slaughtered during the period of diminished corn supply and high prices for pork, reduced the stock considerably. When there is a superabundant corn-crop, the price of hogs rises, on account of the demand for stock purposes to use up the surplus corn, while immediately

after a crop failure large numbers are killed off. The average value of hogs in 1884 is \$5.57, against \$6.75 in 1883.

Exports of American Pork Products.—The exportation of hog products from the United States is one of the most important branches of the export commerce, and far surpasses that of all other countries. In 1881, the year of greatest exportation, the value of pork exports was only exceeded by breadstuffs and cotton. The exports average about 20 per cent. of the annual product. The supply is exceedingly variable, while the home demand is firm and constant, and increases with the growth of population in the West. The foreign trade consequently, while showing a remarkable development, varies greatly from year to year. The quantities and values of the pork exports for the past fifteen years were each fiscal year as follow:

YEAR.	Bacon and hams.		Pork.		Lard.		Total value.
	Pounds.	Value.	Pounds.	Value.	Pounds.	Value.	
1869.....	49,823,165	\$7,493,060	24,428,883	\$3,422,928	41,587,545	\$7,448,948	\$18,943,936
1870.....	59,963,256	6,133,118	24,059,891	3,255,187	37,903,580	5,958,597	18,508,647
1871.....	71,448,534	8,126,038	39,350,750	4,802,530	50,087,397	10,535,090	22,992,023
1872.....	244,303,745	21,128,592	57,109,518	4,122,303	129,651,660	20,177,619	40,424,519
1873.....	393,981,787	33,022,187	64,147,461	3,007,965	280,584,207	21,245,815	61,274,987
1874.....	847,403,405	83,939,938	70,428,879	3,805,712	265,527,471	19,808,019	85,500,689
1875.....	250,236,548	28,612,618	54,162,281	3,671,495	166,969,898	22,900,523	57,184,630
1876.....	827,783,172	89,661,456	54,193,118	3,744,022	163,405,889	23,429,485	67,687,968
1877.....	460,057,146	49,512,412	69,671,594	3,294,414	284,741,228	26,562,065	81,871,491
1878.....	592,814,351	51,752,063	71,939,353	4,918,637	342,766,224	30,022,188	86,687,335
1879.....	782,249,576	51,074,498	84,401,576	4,907,568	324,653,636	32,556,678	78,788,674
1880.....	759,778,109	50,987,623	95,949,780	5,980,352	374,979,226	27,920,267	84,583,242
1881.....	716,944,545	61,161,205	107,923,086	8,272,236	378,142,496	33,224,575	104,660,065
1882.....	465,026,640	44,673,774	50,447,436	7,201,270	280,867,740	23,975,909	53,552,946
1883.....	840,253,670	83,153,959	62,116,809	6,192,268	324,718,474	36,618,048	70,966,268

The average prices of mess-pork per barrel, and lard per 100 pounds, at Chicago, were for the past six calendar years as follow:

YEAR.	Pork.	Lard.
1878.....	\$9 00	\$6 75
1879.....	9 54	6 16
1880.....	13 06	7 40
1881.....	16 47	10 83
1882.....	19 42	11 47
1883.....	15 14	9 16

The percentage which the exports of pork products constituted of the total quantity packed for commercial purposes in the West, not including the hogs slaughtered on farms, in villages, and by city butchers for local consumption, was for the years ending October 31st, from 1878 to 1883 inclusive, as follow:

YEAR.	Pork, bacon, and hams.	Lard.	Total pork product.
1878.....	50-80	94-67	59-87
1879.....	54-90	80-86	60-40
1880.....	58-15	97-55	62-12
1881.....	51-19	88-55	57-84
1882.....	87-52	77-88	45-84
1883.....	84-80	79-82

In the exports are included those manufactured in Eastern cities, in the product only the out-turn of the Western packing-houses. From the above figures it is evident that the pork-packing industry of the West is dependent

on the preservation of the foreign trade, and that the maintenance of remunerative prices in years of abundant production, and to a considerable extent the success of hog-growers, depend on the same condition.

The value of the exports of hog products to the principal foreign countries in the years ending June 30, 1881, 1882, and 1883, was as follows:

COUNTRIES.	1881.	1882.	1883.
	Dollars.	Dollars.	Dollars.
Great Britain and Ireland.....	59,128,087	53,718,936	40,991,819
Germany.....	11,322,657	6,691,356	6,444,426
British North American possessions.....	4,324,044	4,898,228	5,926,612
France.....	10,554,703	4,168,551	3,763,026
Cuba.....	3,124,431	2,281,996	2,183,297
Belgium.....	7,860,488	4,294,755	3,065,423
Denmark.....	1,424,211	915,608	1,378,955
Netherlands.....	1,404,486	770,848	845,388
Sweden and Norway.....	561,719	567,278
All other.....	5,015,244	5,324,821	4,964,023
Total.....	104,660,065	82,552,246	70,966,268

The largest exports of bacon are to Great Britain, amounting to over \$38,000,000 in 1881 and 1882 and nearly \$27,000,000 in 1883. The exports to Germany amounted to \$2,982,852 in 1881, then fell off in consequence of the high prices to \$295,856 in 1882, and rose again, partly stimulated by the prospective exclusion, to \$1,374,432. These figures do not take account

of the considerable proportion of the German imports of pork products which are brought by way of Antwerp. The Belgian imports, in which these are included, are given as \$4,583,807 in 1881, \$1,696,150 in 1882, and \$1,239,123 in 1883. The largest exportation of hams is also to Great Britain, amounting to \$5,853,920 in 1881, \$3,516,799 in 1882, and \$4,670,603 in 1883. Cuba and the other West India islands and countries of South America, with British North America, take most of the remaining ham exports, as well as a large portion of the exports of bacon. The value of the hams exported to Germany is given as \$172,655 in 1881, \$44,024 in 1882, and \$94,851 in 1883; of the exports to Belgium as \$348,348 in 1881, \$83,472 in 1882, and \$59,384 in 1883. The exports of salt pork are also mainly to Great Britain, Canada, and tropical American countries. Lard has not been interdicted in any country. The exports to Great Britain in 1883 amounted to \$7,941,529; to Germany, \$4,867,142; to France, \$3,727,926; to Cuba, \$2,471,774; to Belgium, \$1,728,355; to British North America, \$1,444,177. The exports of bacon and hams to France and Germany were very large and were increasing before the trade was interrupted by their inhibition. The effect of the restriction was to arrest almost entirely the exportation of bacon and hams to France, which decreased in value from \$4,855,932 in 1881 to \$445,719 in 1882, and \$29,246 in 1883. The falling off in the value of lard exported to France, showing the natural effect of the diminution of the supply, was from \$5,567,030 in 1881, to \$3,699,876 in 1882, and \$3,727,926 in 1883. The value of the exports of bacon, hams, and pork for each of the fiscal years from 1869 to 1883 inclusive, to France and Germany, showing the growth of the trade and the effect of the restrictive measures, was as follows:

YEAR.	France.	Germany.
1869.....	\$31,709	\$306,523
1870.....	7,142	177,071
1871.....	267,304	221,863
1872.....	1,150,737	1,708,576
1873.....	1,982,004	5,590,884
1874.....	985,490	3,071,738
1875.....	454,717	2,458,222
1876.....	485,505	2,059,187
1877.....	2,056,390	2,404,754
1878.....	4,203,991	2,251,169
1879.....	3,388,372	2,108,993
1880.....	3,953,359	1,665,858
1881.....	4,987,073	3,263,725
1882.....	468,475	482,426
1883.....	40,100	1,577,308

PORTER, FITZ-JOHN, CASE OF. See page 236.

PORTO RICO, an island of the West Indies, a possession of Spain. It is about 100 miles long from east to west, and 40 from north to south; area, 3,596 square miles. The highest peak in the island is 3,678 feet. In 1883 the census showed a population of 731,648; 369,054 being males and 362,594 females. The island was a penal colony in the last century, and the descendants of convicts have settled on the

mountain plateau and fertile savannas, forming a hardy, laborious population of agriculturists called "Jibaros," whose industry facilitated the extinction of slavery ten years ago. The number of slaves was then about 60,000, and of the colored population about 75,000.

Under the present liberal policy the island can, with its fertile soil and its favorable geographical position, hardly fail to advance morally and materially. At the Geographical Congress which met at Madrid, in 1883, a member, Mr. Ricart, drew the attention of his colleagues to the importance of the Mona passage between Porto Rico and St. Domingo, in connection with the future Panama Canal, recommending the Government to extend to St. John's, Porto Rico, the capital, with an excellent harbor, all sorts of franchises, fortify the island of Mona, and build on it a light-house and telegraph station.

The most populous cities are: Ponce, a port on the south coast, with 37,545 inhabitants; San German, in the interior, 30,146; Mayaguez, a port on the west coast, 26,446; Arecibo, a port on the north coast, 25,754; Utuado, 24,912; St. John's or San Juan, fortified, on the north coast, 23,414; and Yauco, 22,720.

The Captain-General of Porto Rico is the Marquis Don M. de la Vega de Inclan. The American Consul at St. John's is E. Conroy.

Finance.—The budget of the colony, for the fiscal year 1883-'84, estimated the income and outlay as follows:

REVENUE.	
Taxes.....	\$611,256
Custom-houses.....	2,699,020
Monopolies.....	253,700
Income from state property.....	36,000
Sundry items.....	232,100
Total.....	\$3,832,776
EXPENDITURE.	
General outlays.....	\$1,155,381
Department of Justice.....	370,553
" War.....	1,312,943
" Finance.....	998,169
" the Navy.....	74,996
" Administration.....	563,415
" Public Works.....	832,940
Total.....	\$3,938,547

The Minister of the Colonies proposed in 1883 that the treasury notes issued to indemnify planters for the loss of their slaves through emancipation, be converted into bonds to be gradually extinguished at long intervals through the operation of a sinking fund; that the municipal taxes on real estate, and the rural taxes on farms and plantations, be reduced; that the floating debt be kept within a certain limit, the greatest economy observed, and monetary circulation reformed. The home Government, by decree of July 5, 1883, Article VIII, made provisions for the conversion of the treasury notes above alluded to, under authority from the Cortes, the same law ordering the enlargement of the capital, St. John's.

Education.—Under the provisions of a decree issued by the home Government, Aug. 9, 1882, the budget of the island is in future to embrace

the disbursement of the annual amount necessary to defray the support of a professional school, which will be opened in the capital.

Soil.—The soil of Porto Rico is exceedingly fertile, and more sugar to the acre can be produced there than in most West India islands. The climate, though warm, is healthful, but there is an occasional hurricane, like the one of Sept. 7, 1888, which caused great devastation and extensive inundations.

Telegraphs.—The total length of telegraph lines in 1880 was 473 miles.

The Ponce Exhibition.—On Dec. 1, 1888, an agricultural and industrial exhibition was opened at Ponce, a most valuable display being made, especially of everything relating to the culture and manufacture of tobacco. American producers and manufacturers were largely represented at the show.

A Central Sugar-House.—On May 4, 1888, a meeting was held of shareholders in a new central sugar-house, to be founded in the fertile Vega de Yabucoa. The system to which preference has been given for the extraction of sugar is that of Fowler. The estimate of cost is \$325,407; estimate of gross proceeds, \$478,580. From the latter amount the cost of cane will have to be deducted and credited to the agricultural department of the company, \$204,750, and the cost of working the cane in the mill and reducing it to sugar, \$69,570, together \$274,320. This would leave net proceeds of one crop's operations of the sugar-house to the amount of \$204,210. Deducting finally from these proceeds the interest on capital and salaries to manager, engineer, clerks, etc., \$58,805, there would remain \$145,405, equal to about 65 per cent. on the capital of \$225,000 set aside for the starting of the mill.

Commercial Treaty.—Under date of Jan. 4, 1884, it was telegraphed from Madrid that a commercial arrangement would soon be concluded between Spain and the United States, by which Spain would agree to apply the so-called "thirty-column" tariff to imports from America into Cuba and Porto Rico, which would be tantamount to the suppression of the flag and differential duties. Spain would also agree to abrogate the special duties on live fish into Cuba in foreign bottoms, and to suppress the consular and tonnage dues on vessels leaving the United States for Cuba or Porto Rico. The United States would abolish the 10 per cent. ad valorem duties on imports from Cuba and Porto Rico under the Spanish flag.

The closing stipulation of the agreement contains a passage much more important than the immediate reductions. It is thus summarized by the State Department: "Both governments bind themselves to begin at once negotiations for the conclusion of a complete treaty of commerce and navigation between the United States and Cuba and Porto Rico."

Under the provisions of the arrangement we have referred to, the changes in the duties levied upon American products imported into

these islands are as follow, the quantity to which the duty applies being in each case 112 pounds, excepting flour, where the quantity is 220 pounds, and rough white-pine lumber, where the quantity is 1,000 superficial feet: Apples, old duty, \$1.46, new, \$1.18; bacon, old, \$3.82, new, \$2.82; beans, old, \$1.12, new, 83 cents; butter, old, \$6.65, new, \$5.19; cod-fish, old, \$1.09, new, 81 cents; calico, old, \$21.21, new, \$15.92; cotton duck, old, \$12.31, new, \$9.10; flour, old, \$5.51, new, \$4.69; lard, old, \$4.44, new, \$3.32; petroleum, old, \$2.91, new, \$2.18; potatoes, old, 64 cents, new, 45; hams, old, \$3.82; new, \$2.82; rice, old, \$1.91, new, \$1.45; straw paper, old, \$1.12, new, 80 cents; rough white-pine lumber, old, \$6.65, new, \$5.19. The duties thus designated as new are those which for upward of 20 years have been imposed upon these goods imported into Cuba or Porto Rico in Spanish bottoms.

Port Regulations.—A short time before the home Government adopted a liberal policy, the local authority in Porto Rico acted in a spirit precisely the reverse, and on Nov. 11, 1888, a decree went into effect that vessels arriving shall pay \$1.25 per 1,000 kilos, gross weight, on all cargo landed (instead of \$1 as formerly), and \$1 per 1,000 kilos on all cargo loaded outward, whether vessel arrives with cargo or in ballast, which is a new tax, and is equal to about 7 cents per 100 pounds on a cargo of sugar. For a number of years past the charges in Porto Rico have been moderate, but this makes them more than they are in Cuba.

Commerce.—The peninsular and foreign trade movement in Porto Rico in the years 1881 and 1882 is given as follows:

	Import.	Export.
1881.....	\$12,037,648	\$12,980,087
1882.....	14,816,504	16,582,834

The American trade with Porto Rico is shown in the following table:

FISCAL YEAR.	Import from Porto Rico into the United States.	Domestic export from the United States to Porto Rico.
1880.....	\$5,443,896	\$1,969,284
1881.....	3,860,199	1,712,782
1882.....	5,716,874	1,938,214
1883.....	5,477,493	2,116,499

The chief articles imported into the United States in 1883 were: sugar, 83,940,670 pounds; and molasses, 5,448,821 gallons.

In 1882 there entered Porto Rican ports 1,586 vessels; aggregate tonnage, 1,114,340; sailed, 1,502 vessels; aggregate tonnage, 992,687.

PORTUGAL, a monarchy in southern Europe. The fundamental law is the charter granted in 1826 by Dom Pedro IV, and revised in 1852 by the Cortes. The representative assembly consists of two chambers, that of the Peers, who are nominated for life by the King and number 150, and the Chamber of Deputies, which has consisted since 1878 of 149 mem-

bers. The latter are elected directly by all citizens possessing a net income of \$110. The Cortes assemble at stated periods without the intervention of the sovereign, who has no veto on a law passed again after he has sent it back unsigned. New elections are held every four years. All laws relating to the army and to general taxation must originate in the Chamber of Deputies.

The reigning King is Luis I, born Oct. 31, 1838, the son of Queen Maria II and of Prince Ferdinand of Saxe-Coburg. He succeeded his brother, Pedro V, Nov. 11, 1861.

The Cabinet resigned in October, and was reconstituted on the 23d of that month as follows: Senhor Fontes Pereira de Mello, Premier and Minister of War; Senhor Barjova Freitas, Minister of the Interior, *vice* Senhor Ribeiro da Fonseca; Senhor Barboza Bucage, Minister of Foreign Affairs, *vice* Senhor Serpa Pimentel; Senhor Lopo-Vaz, Minister of Justice, *vice* Dr. Marques de Villena; Senhor Hintz Ribeiro, Minister of Finance, *vice* Senhor de Fontes Pereira de Mello; Senhor Penhiro Ohagas, Minister of Marine, *vice* Senhor de Mello Gouvea; Senhor Aguiar, Minister of Public Works, *vice* Senhor Hintz Ribeiro.

Area and Population.—The area of continental Portugal, which is divided into six provinces, is 36,510 square miles. The population at the census of Jan. 1, 1878, was 4,160,815. The Azores are 966 square miles in area, and have a population of 259,800; Madeira and Porto Santo, with an area of 817 square miles, contain 130,584 inhabitants. The total population of the kingdom was 4,550,699, of which number 2,175,829 were of the male and 2,374,870 of the female sex. The only cities containing more than 100,000 inhabitants were Lisbon, with 246,343, including the suburbs of Belem (80,029 inhabitants) and Olivæas (28,910 inhabitants); and Oporto, with a population of 105,838. The number of marriages in 1875 was 33,095; births, 153,597; deaths, 106,678.

Colonies.—The transmarine possessions of Portugal in Africa and Asia have an aggregate area of 709,469 square miles and an estimated population of 3,806,247 inhabitants. The Cape Verd islands contain 1,650 square miles, and had in 1879 a population of 99,817. Stations in Senegambia, Bissão, and other parts of Guinea were reported in 1878 as covering 26 square miles and having a population of 9,292. Prince's and St. Thomas's islands are 454 miles in extent, and had in 1878-79 a population of 20,931. Ajuda is 18 miles in extent, with 4,500 inhabitants. The possessions in Asia are the colonies in India of Goa, Salsette, Bardes, etc., which were reported in 1881 as embracing 1,447 square miles, and containing 419,993 inhabitants, and of Damao and the isle of Diu, 158 square miles in extent and containing 61,474 inhabitants; Macao and dependencies, covering 28 square miles and containing 68,086 inhabitants; and Timor and Cambing, containing 5,527 square miles and about 800,000 in-

habitants. The principal possessions of Portugal in extent are in equatorial and southern Africa. The area of the dominions on the east coast of Angola, Ambriz, Benguela, and Mosamedes is given as 812,509 square miles, and the subject population as about 2,000,000; the area of Mozambique and dependency, on the other side of the continent, as 382,683 square miles, and the population as 850,000. The dependence of Mozambique on the mother-country is very incomplete. The natives treat their white rulers with slight respect. When one of the frequent uprisings takes place, the Portuguese retire within the fortifications and wait until the disturbance subsides. The expenditures for the government and development of the colony are not covered by the receipts, although a duty of from 10 to 30 per cent., which it is intended to increase to from 30 to 50 per cent., is collected on imports, and an average duty of 2 per cent. on exports, besides taxes on sales, an income-tax of 10 per cent., municipal taxes, etc. The complex and oppressive burdens are a hindrance to commerce. The chief exports are millet, gum-elastic, ivory in small quantities, wax, and tortoise-shell. All these come from the continent. The island of Mozambique produces nothing but bread-fruit trees and a few palms. The imports consist of cotton goods, pearls, brass utensils, powder, fire-arms, etc.

Commerce.—The total imports in 1882 were of the value of 24,875,000 milreis, against 23,601,000 in 1881, and 24,948,000 in 1880; total exports, 17,488,000 milreis in 1882, 18,588,000 in 1881, and 24,716,000 in 1880.

The commercial intercourse with the principal foreign countries was as follows:

COUNTRIES.	Imports.	Exports.
	Milrsh.	Milrsh.
Great Britain.....	15,228,000	10,782,000
Brazil.....	2,140,000	5,964,000
France.....	4,140,000	1,474,000
United States.....	5,293,000	700,000
Spain.....	2,085,000	1,778,000
Germany.....	1,680,000	1,182,000
Sweden and Norway.....	1,212,000	447,000
Portuguese possessions.....	666,000	751,000
Other countries.....	2,314,000	1,657,000
Total.....	84,948,000	24,716,000

The principal classes of merchandise in 1880 were of the following values:

COMMODITIES.	Imports.	Exports.
	Milrsh.	Milrsh.
Cereals.....	6,000,000	600,000
Fruits, etc.....	679,000	2,254,000
Colonial produce.....	2,958,000	792,000
Wines, etc.....	478,000	9,000,000
Animals and animal products.....	4,511,000	2,440,000
Mineral products.....	2,192,000	2,104,000
Metals.....	4,544,000	343,000
Hides, leather, etc.....	2,887,000	413,000
Timber, etc.....	1,007,000	3,165,300
Glass and pottery.....	318,000	27,000
Textile materials and manufactures.....	5,738,000	304,000
Miscellaneous manufactures.....	3,249,000	650,000
Drugs, etc.....	897,000	419,000
Total.....	84,948,000	24,716,000

The exports of wine to Great Britain constituted about one fifth of the total quantity imported into that country.

The movement of shipping in 1880 was as follows: sail tonnage entered, 7,381,000 cubic metres, of which 2,258,000 cubic metres were under foreign colors; cleared, 7,637,000 cubic metres; steam tonnage entered, 3,278,000 cubic metres, of which 2,407,000 cubic metres were under foreign colors; cleared, 3,110,000 cubic metres. The Portuguese tonnage entered included sailing-vessels of 247,000, and steamers of 778,000 metric tons in the coasting trade.

The merchant marine in 1881 consisted of 41 steamers, of 14,092 cubic metres, and 412 sailing-vessels, of 88,829 cubic metres.

The length of railroads in operation in 1882 was 1,673 kilometres, or 1,045 miles. The length of telegraph lines at the beginning of 1881 was 4,869 kilometres, or 2,715 miles; length of wires, 10,889 kilometres, or 6,770 miles; number of telegrams dispatched in 1880, 1,121,884, of which 423,937 were domestic. The post-office forwarded 20,333,171 letters and 15,276,552 packets and newspapers in 1881.

Army and Navy.—The army is raised partly by conscription and partly by enlistment. The effective is fixed annually by the Cortes. It was nominally 78,200 on the war footing in 1882. The actual strength in that year was reported as 26,059 men under arms.

The navy in 1888 consisted of 31 steamers, with 94 guns, and 16 sailing-vessels. The only efficient vessels were the *Vasco do Gama*, an iron-clad ram with 10-inch plates and two 18-ton and three smaller guns, and two corvettes.

Finances.—The revenue for ten years has averaged \$25,000,000, and the expenditure \$28,750,000. The budget for 1882-'83 estimates the yield of the different sources of revenue as follows, in milreis (one milreis = \$1.08):

SOURCES OF REVENUE.	Amount.
Land tax	3,152,000
Other direct taxes	2,914,000
Stamps and registry fees	3,075,700
Customs, excise, etc.	15,210,770
Railroads, etc.	2,578,984
Repayments, etc.	1,104,678
Extraordinary receipts	1,618,000
Total	39,654,019

The expenditures are stated in the budget as follow:

BRANCHES OF EXPENDITURE.	Amount.
Domestic debt	7,137,966
Foreign debt	5,951,455
Ministry of Finance	5,768,870
" the Interior	2,161,149
" Worship and Justice	627,373
" War	4,599,980
" Marine and Colonies	1,663,721
" Foreign Affairs	308,436
" Public Works	2,727,084
Total ordinary expenditures	30,940,938
Extraordinary expenditures	4,885,278
Total	35,276,311

There has been no budget for thirty years without a deficit. The revenue during the same period increased about 60 per cent. The

deficit in 1867-'68 was 5,811,560 milreis. It was reduced to 1,156,000 milreis in 1879-'80. The Minister of Finance in 1880 declared that there was no control over the public purse, that the balances shown in the budget for the previous six years had been fictitious, and that the appropriations had invariably been exceeded, sometimes without the authorization of a special law. During those years over £9,000,000 had been obtained by loans.

The public debt on June 30, 1881, amounted to 430,879,899 milreis, not including the old debt, of which 1,927,899 milreis remained to be converted in 1879, consisting mainly of paper currency. Of the new debt, 232,929,849 milreis represented the internal loans, bearing interest at 8 per cent. The foreign debt at that date consisted of sterling loans to the amount of £43,908,900, or 197,950,050 milreis. In 1882 a new loan of £5,189,000 was issued. There is also a large floating debt, estimated as high as £4,000,000. In 1882 there were defaults in the interest of the new debt amounting to 2,978,469 milreis on the internal, and 3,139,689 milreis on the external loans.

Political Situation.—The republican agitation in Spain excited in Portugal the chronic discontent and hostility to the King, to a degree which rendered the political situation critical and grave. The Progressist party accuse the King of repeated breaches of the Constitution in keeping the Conservatives in office. The Republican party in Portugal is exceedingly numerous and energetic. The Congo question was made a ground of attacks on the Fontes ministry by the Republicans and Radicals, as the Delagoa Bay negotiations were in 1881. The changes in the ministry in October, though attributed officially to differences of opinion in relation to the Lisbon municipal elections, were rather due to the general dissatisfaction. The new members of the Cabinet were more liberal in their tendencies than their predecessors.

A revolt of peasants occurred at Couero in October. It had its origin in religious fanaticism, and was only suppressed with difficulty by troops sent from Lisbon.

Sovereignty Rights over the Congo.—The Portuguese have shown an ambition in recent years to renew their ancient activity in Africa, and share in the labors and the fruits of the commercial development of the interior. Portugal's claims to the west coast between 5° 12' and 8° south latitude are recognized in treaties with Great Britain and France. These limits include the mouth of the Congo. The activity of the French in these regions excited the jealousy of the Portuguese. When the French occupied Ponta Negra, the captain of the Portuguese war-vessel *Bengo*, stationed in those waters, protested, under the supposition that the annexed district was within the territory claimed by Portugal. He sent a dispatch home asking for re-enforcements. The feeling aroused in Portugal by the French annexation tendencies shown in these regions was allayed when the

English Government manifested a disposition to oppose the establishment of French power over the Congo mouth. In November Chi Loango, as far as the river Luisa, which lies north of 5° 12', was taken possession of by the Portuguese, with the object, as was said, of having a river boundary, which would clearly define the limits of the territory claimed by Portugal. The Luisa flows ten miles south of the new French station of Ponta Negra. The entire territory, from the Massibi river to Molembo, was subsequently taken possession of, in virtue of a treaty which was signed September 29th with the Cacongo chiefs.

POSTAGE. See page 185.

POTTER, Henry Codman, an American clergyman, born in Schenectady, N. Y., May 25, 1835. He is a son of Bishop Alonzo Potter, of Pennsylvania, and grandson of Rev. Dr. Nott, President of Union College. His education was obtained chiefly at the Episcopal Academy, Philadelphia, and on leaving this institution he entered upon mercantile life. Not long after he relinquished business, studied for the ministry under his father's direction, entered the Theological Seminary of Virginia, at Alexandria, and graduated therefrom in 1857. He received deacon's orders at his father's hands in St. Luke's Church, Philadelphia, May 27, 1857, and priest's orders in Trinity Church, Pittsburg, at the hands of Dr. Bowman (Assistant Bishop of Pennsylvania), Oct. 15, 1858. His first pastoral work was as rector of Christ Church, Greensburg, Pa. In May, 1859, he became rector of St. John's Church, Troy, N. Y. In 1862 he was elected rector of Christ Church, Cincinnati; in 1863 was elected President of Kenyon College, Ohio; and in the same year he was elected rector of St. Paul's Church, Albany, N. Y.—all of which he declined. But, after seven years' service in Troy, he accepted, in 1866, the place of assistant minister of Trinity Church, Boston, Mass. In May, 1868, he became rector of Grace Church, New York, which office he filled with singular success for fifteen years. In 1875 he was elected Bishop of Iowa, but declined. He received the degree of D. D. from Union College in 1865, and LL. D. from the same college in 1880. He was secretary of the House of Bishops from 1865 to 1888, and also for many years was one of the managers of the Board of Missions, in the domestic department.

In 1883, Bishop Horatio Potter having called for an assistant, the convention, which met in September of that year, acceded to his plea of age and infirmity, and with promptness and unanimity elected Dr. Henry C. Potter, the aged bishop's nephew, to the office of Assistant Bishop of New York. He was consecrated in Grace Church, Oct. 20, 1883, a very large number of bishops and clergy being present and taking part in the solemn services. By formal instruments, soon after executed, the bishop made over the entire charge and responsibility of the work of the diocese into

the assistant's hands. The new bishop's cordial sympathy with clergy and laity and with every good work, and his signal success in conducting the affairs of a large and important parish in New York city, indicated a future of honor and usefulness to the Church.

Bishop Potter's published works include: "Sisterhoods and Deaconesses, at Home and Abroad: A History of their Rise and Growth in the Protestant Episcopal Church, together with Rules for their Organization and Government" (1872); "The Gates of the East: A Winter in Egypt and Syria" (1876); and "Sermons of the City" (1880).

PRESBYTERIANS. I. Presbyterian Church in the United States of America.—The following is a summary of the statistics of the (Northern) Presbyterian Church in the United States of America, as they were reported to the General Assembly in May, 1888; to which are added, for comparison, the statistics for 1881 (in which year the synods were consolidated) and 1882:

	1881.	1882.	1883.
Synods	88	28	28
Presbyteries	177	180	182
Candidates	623	626	673
Licentiate.....	801	801	292
Ministers.....	5,066	5,148	5,218
Elders.....	16,501	18,584	18,956
Deacons.....	4,596	5,648	5,576
Churches.....	5,598	5,744	5,538
Churches organized	90	183	166
Communicants.....	551,401	592,128	600,005
Added on examination.....	25,844	29,889	32,182
Baptisms of adults.....	8,174	9,678	10,897
Baptisms of infants.....	17,489	19,022	17,728
Members of Sunday-schools.....	638,564	654,051	663,765

The several boards and permanent committees reported to the General Assembly concerning their financial condition and the progress of their work, of which the following summaries give the principal facts:

CONTRIBUTIONS.	1881.	1882.	1883.
	Dollars.	Dollars.	Dollars.
For home missions.....	456,098	467,625	502,200
For foreign missions.....	475,626	465,219	501,578
For education.....	190,799	192,970	167,254
For publication.....	88,015	48,609	89,179
For church erection.....	156,281	189,620	100,391
For relief fund.....	68,484	66,022	75,249
For freedmen.....	69,097	70,582	84,012
For sustentation.....	21,570	20,697	31,275
For General Assembly.....	48,098	44,223	46,547
Congregational.....	6,288,579	6,863,640	7,139,904
Miscellaneous.....	817,744	929,910	588,444
Total.....	8,674,291	9,263,897	9,661,496

Board of Home Missions.—Receipts, \$504,795, or \$81,406 more than the receipts of the previous year. The report of the board calls attention to the growing importance of its work in the Eastern States, where, in consequence of the constant changes of population by the removal of old inhabitants, the influx of foreigners, and the starting of new kinds of industries and of new manufacturing centers, nearly as great a demand for missionaries exists as in frontier regions. Thirteen hundred and eighty-seven missionaries and 133 mission-

ary teachers had been under commission, and 186 churches and 279 Sunday-schools had been organized during the year. The whole number of church-members was 78,669, with a total of 125,977 in congregations, and the number of members in 1,777 Sunday-schools was 120,936. Special attention was given to the maintenance of schools in the Indian Territory, among the Indians in New Mexico and Arizona and in Alaska, among the Mexican populations in New Mexico and Southern California, and among the Mormons in Utah and Idaho. Six new colleges had been organized in Minnesota and Kansas, and the Territories.

Board of Education.—The receipts, \$78,499, exceeded those of the previous year by \$9,474, while the permanent fund had been increased by \$10,000. Four hundred and eighty-six candidates had been aided in sums of \$100 or \$120 each; among them were thirty-five Germans, three Bulgarians, sixty-eight colored students, eleven Indians, one Spaniard, one Welshman, and one Hindoo.

Board of Publication.—Receipts, \$281,124; expenditures, \$252,442; amount of sales, \$195,420. The publications included 443,750 copies of books and tracts, and 11,947,319 of periodicals and reports. The sum of \$49,988 had been received, and \$42,077 had been expended, for missionary work.

Board of Church Erection.—Receipts, \$109,068. Appropriations of \$104,594 had been made to 215 churches and missions, being an average of \$486 to each church. A book of fifty-one designs for churches and chapels had been published.

Board of Relief.—Receipts, \$105,566, besides \$23,374 bequeathed to the permanent fund; amount of permanent fund, \$300,410; number of beneficiaries, 486.

Board of Missions for Freedmen.—Receipts, \$103,741; amount of Endowment and Permanent Funds, \$14,120; number of missionaries and teachers, 197; number of churches under the care of the board, 178, of which four had been organized during the year; number of communicants, 12,823; number of Sunday-schools, 156, with 10,771 scholars. Nine hundred and sixty-nine persons had been added to the churches on examination, and 1,359 persons had been baptized. The board maintained 60 schools, with which were connected 124 teachers and 6,995 pupils. Five of the schools were of the grade of academies or above it, including a theological department, and returned 1,856 students.

Board of Foreign Missions.—Receipts, \$656,237; expenditures, \$669,620. The missions are among ten Indian tribes of the United States, in Mexico, Guatemala, the United States of Colombia, Brazil, Chili, West Africa, India, Siam (Laos), China, among the Chinese in California, and in Japan, Persia, and Syria. They returned in all 159 American ministers, 92 ordained and 138 licentiate native ministers, 286 American male and female and 585 native lay

missionaries, 18,656 communicants, and 21,253 pupils in day and boarding schools.

The General Assembly of the Presbyterian Church in the United States of America met at Saratoga Springs, N. Y., May 17th. The Rev. E. F. Hatfield, D. D., was chosen moderator. Fraternal delegates from the Southern Church were received for the first time since that Church was organized during the excitement incident to the questions involved in the civil war. A final motion was passed in respect to the restoration of fraternal relations with the Southern Church by the adoption of the report of the committee to whom the subject had been referred, to the effect that "fraternal relations have been happily established between the two Assemblies on the basis of a withdrawal of all imputations which may have been made officially from either side against the Christian character of the other, and no further action is necessary."

A committee was appointed to meet a similar committee, should one be appointed by the Southern Assembly, to agree upon plans of comity and co-operation between the two bodies in regard to theological and collegiate education, missions among the freedmen, the occupation of territory, and other subjects on which questions may arise. The following report was adopted on the subject of the current rationalistic and scientific methods of examining and criticising the Scriptures:

The General Assembly feels constrained to express itself clearly and decidedly on the rationalistic treatment of the Holy Scriptures by Protestant teachers in Europe, whose works are introduced into our country and whose evil influence is felt in our Church. Our "Confession of Faith" (Chap. I, sec. 2), after giving the names of the books of the Old and New Testaments, adds, "All which are given by inspiration of God to be the rule of faith and life." The denial of the authenticity or truthfulness of the Holy Scriptures is a denial of their inspiration, and any teaching that suggests such denial should be not only carefully avoided but studiously repelled. The Assembly would not discourage the full use of all light in critical study, nor does it assume that any erroneous teaching is welcomed or offered within the bounds of the Church, but it would warn all pastors and teachers of the danger to young and inexperienced minds in the free use of crude theories and unproved speculations on the part of religious instructors, and would remind them of the paramount importance of sustaining in positive doctrine the authenticity, integrity, truthfulness, and inspiration of the Holy Scriptures against the unsanctified learning by which an unbelieving world through nominally Christian channels assaults the Church of God.

The Assembly would also remind the Presbyteries of their special responsibility as guardians of the faith, and that in view of the apprehensions excited throughout the Church by the rationalistic handling of the word of God, it is incumbent upon them to see to it that the appropriate constitutional action be taken, if at any time it should become manifest that any minister of our Church was promulgating theories of dangerous tendency or contra-confessional doctrine concerning the Holy Scriptures.

A new board was established, to have in charge the interests of higher education as connected with the Presbyterian Church, and to be called "the Presbyterian Board of Aid for

Colleges and Academies." Its functions were defined to be, to obtain annual offerings from the churches for the cause; to co-operate with local agencies in determining sites for new institutions; to decide what institutions shall be aided; to assign to such institutions special fields open to their appeals; and to discourage all independent appeals to the Church at large. Every institution hereafter established must, as a condition of receiving aid from the board, either be organically connected with the Church, or must, by charter provision, perpetually have two thirds of its Board of Control members of the Presbyterian Church; in the case of institutions already established and not covered by these stated provisions, appropriations for endowments must be so made that the funds shall revert to the board whenever those institutions shall pass from Presbyterian control. A report on the revision of the "Book of Discipline" was considered, the proposed amendments being acted upon in detail, and the result of the labors of the Assembly on the subject was referred to a committee to be put into shape. Among the amendments adopted were provisions that ministers, elders, and deacons suspended for immoral conduct shall not be restored, and that withdrawing members joining another church shall be dropped from the rolls without action, unless charges have been presented and then prosecuted. A declaration was adopted that the extermination of the traffic in intoxicating liquors by the "power of the Christian conscience, public opinion, and the strong arm of the law," would be rejoiced over by the Assembly. A committee was appointed to consider the question of a permanent place of meeting, and the erection of a hall for the General Assembly.

II. Presbyterian Church in the United States.—The summary of the statistics of the (Southern) Presbyterian Church in the United States as presented to the General Assembly in May, is as follows: Synods, 18; presbyteries, 67; ministers, 1,070; candidates, 199; licentiates, 45; churches, 2,040; churches organized, 46; ruling elders, 6,290; deacons, 4,220; communicants, 127,017; added on examination, 6,638; adults baptized, 1,719; infants baptized, 4,485; baptized non-communicants, 33,474; teachers in Sunday-schools, 7,706; pupils in Sunday-schools, 78,725; contributions for all purposes, \$1,269,416.

The executive committees of the various missionary and benevolent enterprises made reports to the General Assembly concerning the condition of the trusts under their care, of which the condensed summaries are as follow: The receipts for publication during the financial year had been \$8,534. The total receipts for home missions had been \$67,278, or \$18,462 more than the receipts of the previous year. The sum of \$23,846 had been paid from the sustentation fund; 178 ministers, serving between 400 and 500 churches, had been aided in support; and 86 churches had been aided in

obtaining houses of worship, to the amount of \$5,550. Appropriations of \$15,190 had been made in the support of 20 evangelists; while reports from various presbyteries (in no case including the whole number aided) showed that through the evangelists 52 churches had been organized, 940 members had been received into the Church, 817 destitute points had been supplied, and 21 Sunday-schools had been organized. Appropriations had been made from the colored evangelistic fund for 11 ministers and two church buildings; while the Presbyteries co-operating with the fund reported as under their care 12 ministers and licentiates, 28 churches, 12 candidates, and 23 Sunday-schools. Twenty-three ministers and the families of 76 deceased ministers had been aided by the invalid fund, from appropriations amounting to \$9,195. Payments of \$3,700 had been made from the relief fund to the families of 13 deceased ministers. The receipts of the Tuscaloosa Institute for the training of colored ministers had been \$3,173.

The General Assembly of the Presbyterian Church in the United States met at Lexington, Ky., May 17th. The Rev. Theodoric Prior, D. D., of East Hanover, Va., was chosen moderator. The most important business transacted by the body was that relative to the restoration of fraternal relations with the Northern Presbyterian Church, the subject being taken up where it had been left by the General Assemblies of the two bodies in the previous year, and carried out to a conclusion. Delegates were in attendance from the Northern General Assembly, bringing a fraternal letter, in which were the words:

You may not have said very much that was offensive to those on our side; you may have thought, you probably did think, many hard things. We did not ask you to regret or withdraw anything. You studied to do those things that make only for peace. You, of your own accord, expressed regret for and withdrawal of the offensive word. In your magnanimity you got the start of us and did this noble thing.

The fraternal delegates were afterward given an official reception in their own persons by the Assembly, when addresses appropriate to the occasion were delivered by them and by the moderator. Afterward a dispatch was received from the Northern General Assembly reporting that it had resolved, upon the recommendation of its committee to whom the subject had been referred, that "fraternal relations having been happily established between the two Assemblies on the basis of the withdrawal of all imputations officially made from either side against the Christian character of the other, no further action of this Assembly is necessary." The final action of the Assembly upon the subject took the shape of a resolution directing that—

The usual method of correspondence by letter between this General Assembly and other ecclesiastical bodies shall hereafter include the General Synod of the Reformed Church in America and the General Assembly of the Presbyterian Church in the United

States of America; with the exception, however, that delegates be appointed by this Assembly to these bodies at their next ensuing sessions in 1883 and 1884 respectively, to convey our most cordial Christian fraternal salutations; these delegates being instructed to state to them this method of correspondence hereafter by letter as adopted by this body, with the hope that it may meet with their co-operation; and that the special attention of the presbyteries be called to this action of the General Assembly for an expression of their opinion on the mode of correspondence for the future.

An overture was presented from the Presbytery of Upper Missouri, asking the Assembly to appoint a committee to confer with a like committee of the Northern Assembly "to bring about closer relations between the two branches of the Church, and, if practicable, open the way for organic union, or for such a division of the Presbyterian field as may place it under several Provincial Assemblies." The Assembly, by a vote of 103 to 82, declared it inexpedient to appoint such a committee. A committee appointed by the previous General Assembly to inquire into the expediency of removing some of the higher qualifications required as tests of the competency of candidates for the ministry, including acquaintance with the Greek and Hebrew languages, made a report adverse to any lowering of the standard. The whole subject was considered by the Assembly in debate, and its decision was embodied in a resolution that—

The proposed change is not necessary even to effect the object contemplated, i. e., to open the way to the ministry for men, otherwise qualified, who have not pursued the ordinary course of study preparatory thereto; inasmuch as this is a point which, so far as it should be an open question, is left to the discretion and decision of the presbytery. The presbyteries already possess the constitutional powers in question, both for licensure and for ordination.

The previous General Assembly having invited expressions of opinion from the presbyteries upon overtures seeking the removal from the Confession of Faith of the clauses prohibiting marriage with a deceased wife's sister, answers were received from fifty-five presbyteries, forty-three of which, or more than two thirds of the presbyteries in the Church, had expressed themselves in favor of the change. The Assembly decided to take the requisite constitutional steps for having the prohibitory clauses stricken out. A memorial asking the Assembly to organize the colored churches into a General Assembly was answered in the negative, on the ground that the matter was premature.

III. United Presbyterian Church in North America.

—The following is a summary of the statistical reports of this Church as presented to the General Assembly in May: Number of synods, 9; of presbyteries, 60; of ministers, 780, of whom 525 were pastors and 205 without charge; of licentiates, 43; of theological students, 52; of congregations, 889; of members, 85,443; of baptisms, 707 of adults and 3,599 of infants; of Sunday-schools, 823, with 8,643 officers and teachers, and 77,800 pupils.

The Board of Publication reported to the General Assembly that its receipts for the year had been \$56,760, and its expenditures \$54,663, and that its assets were valued at \$107,894. By the action of the General Assembly, this board was given the appointment of the Sunday-school Committee and full charge of the Sunday-school literature of the Church.

The Board of Education had received \$5,186, and returned \$18,009 of assets. It had given assistance during the year to 14 students.

The Board of Ministerial Relief had received \$6,460, and had disbursed to beneficiaries, \$2,900; and returned an endowment fund of \$30,000. It had 24 beneficiaries receiving quarterly aid.

The receipts of the Board of Freedmen's Missions—\$16,767—had been sufficient to meet all the expenses of its work during the year, and to pay \$4,375 of its indebtedness. It still owed \$6,500. The board returned an aggregate enrollment of 1,197 pupils in all its schools and 1,200 in its Sunday-schools. Seventy-five of its students had taught during the year in the public schools. Special reports were made of the schools at Knoxville, Tenn.—where an orphanage for girls had been established—and Chase City, Norfolk, and Bluestone, Va.

The receipts of the Board of Foreign Missions for the year had been \$102,975. It made report concerning the missions in Egypt and in India, in connection with which were returned 88 principal and subordinate stations; 17 ordained foreign missionaries, with 48 women missionaries; 11 native ordained ministers, with 200 other native laborers; 22 churches, with 1,909 communicants; 51 Sunday-schools, with 2,555 scholars; 93 mission-schools, with 4,581 pupils; and 467 baptisms during the year. The increase of communicants during the year was 482, showing an increase of 26 for every ordained foreign missionary. The native converts had contributed for all purposes \$11,610, or an average of \$2.58 for each communicant in India, and of \$8.47 for each one in Egypt. The board was instructed to consider the subject of establishing a mission on the upper Nile, and, "if the way be clear, to undertake the work."

The General Assembly of the United Presbyterian Church in North America met in Pittsburg, Pa., May 24th. The Rev. Dr. W. H. McMillan, of Allegheny City, was chosen moderator. The subject of allowing the use of instrumental music in the services of worship again received attention, a considerable number of memorials having been introduced asking for such modification of the action of the previous General Assembly as should prevent its being construed into a permission to employ instruments. The memorial, most numerous signed, which was regarded by the committee to whom the number were referred as definitely expressing what was expressed or implied in all the others, asked the General Assembly "to declare explicitly that in none of

the congregations under the care of the Assembly can instrumental music be lawfully used in worship until the Church shall have decided by constitutional enactment that such music in worship is divinely authorized and prescribed." The papers were referred to the Committee on Bills and Overtures, which made a report covering the construction to be placed upon the action of the preceding General Assembly, and respecting the nature—as to whether it is a matter of binding obligation or not—of the subject of the action. Concerning the bearing of the action of the previous Assembly, the report said the language in its resolution—

Must be understood in harmony with the declaration in the resolution itself, "that there is no sufficient Bible authority for an absolutely exclusive rule on the subject," and also in harmony with the entire action of which that resolution was but a part, in which the prohibitory law was declared to be repealed. The repeal of a law does not authorize anything except freedom from its restraints. Formally, it neither commands nor forbids anything. It simply leaves the subject without the law repealed.

In regard to the second point, in which the memorialists opposed tolerance of instrumental music with arguments drawn from the declaration in the Confession of Faith, to the effect that God must be worshiped in the way appointed in his Word, the committee urged—

That the question is not of the correctness of the principle so enunciated, but of the correctness of the application that is made in this case. To an ordinance of worship, or anything appointed in it, it is clearly applicable. Baptism and the Lord's Supper, for example, must be observed by the exclusive use of the elements appointed for each. But there may be mere incidents of an ordinance or helps to its observance, no part of the ordinance itself, which are not placed under such restrictions. In regard to the ordinance of praise, no intelligent Christian looks for the appointment of the particular tunes to be sung, or the particular means by which the key-note may be found, or for the use of musical notes as a help in singing, or the employment of trained singers to lead in the praise service. Such are among the things confessedly left to "Christian prudence."

Now, the question is, to which of these classes does the instrumental accompaniment belong, the essentials or the incidentals of worship? That is the very core of the question decided in the repeal of our prohibitory law. That law was what may be said to have been our statutory application of the principle cited from the Confession. To repeal that law, as has been done, was to declare it a misapplication of the principle; or that the thing forbidden by the law was one to which that general principle did not properly apply; in other words, that there was nothing in the ordinance of praise or any other Bible authority to justify such prohibition. That is the recorded judgment of the Church. While that judgment stands, how can we consistently declare, as asked in this memorial, that under the principle cited the prohibitory law is in effect still operative? And if we did, of what authority or force would such a declaration be?

The report of the committee was adopted, and with it the resolutions:

1. That the action of the last Assembly on this subject be reaffirmed as explained in this report.
2. That its admonitory resolution, advising and enjoining against all action on this subject offensive to fellow-worshippers or disturbing of the peace of congregations, be emphatically reaffirmed, and urged

with renewed earnestness on the attention of the pastors and sessions and people of the whole Church.

A committee was appointed to address a pastoral letter to the people of the Church—

Setting forth the true state of the question as settled by the Church, and urging upon them the respect due the authority of the Church and to each other as Christian brethren.

The party opposed to the permission of instrumental music, who were represented by a minority report of the committee recommending the direct submission to the presbyteries of a permissive overture, recorded a protest against this action. The quarter-centennial anniversary of the formation of the United Presbyterian Church (which took place in 1838) was celebrated with appropriate exercises during the sessions of the Assembly. The committee which had in hand during the year the collection of memorial funds reported that the contributions amounted to \$181,593, of which \$42,061 were designated for special objects. A scheme was approved by the Assembly for the division of the undesignated contributions, amounting to \$89,532, among the benevolent boards and educational institutions of the Church.

Convention of Opponents to Instrumental Music.—

A convention of members of the Church opposed to the use of instrumental music met in Allegheny City, Pa., August 14th. It was attended by 478 delegates, clerical and lay, including woman-delegates, who took full part in the deliberations. Gen. James A. Ekin, U. S. A., was chosen president. Essays were read by different members of the convention, supporting the opposition to musical instruments from the "History of United Presbyterianism" and the "History of the Introduction of Music into the Reformed Churches." The question was also argued on grounds of Divine authority and of the traditions of the Church; and the action of the General Assembly in admitting instrumental music was further declared invalid, because, it was alleged, it was taken in violation of the constitution, and was based upon unconstitutional returns of votes. The convention, declaring that by the action of the General Assembly a crisis had been precipitated in which it had become necessary to do something to secure liberty and rights of conscience in the Church, resolved:

That whether the rule in our directory was repealed or not, we assert that, even without such rule, the Constitution of the Church, its Expression of Faith, Catechism, Testimony, Book of Worship, unwritten law, and ancient usage, preclude the use of musical instruments in worship in the United Presbyterian Church, and that they always have been and still are unlawful, and their intrusion on unwilling parties is a violation of personal liberty and the rights of conscience.

That, standing as we do on the Constitution and laws of the United Presbyterian Church, as adopted at the time of the union, we claim for ourselves the liberty of conscience guaranteed by that solemn compact, and we propose to remain steadfast and maintain our rights and liberties in the Church by all legitimate means.

That, without derogating from the just respect that is due to the General Assembly as the superior court of the Church, we nevertheless claim that our obedience and submission are due to it only as its decisions are in accordance with the mind of Christ, as expressed in the standards of the Church.

Other resolutions looked to securing from the General Assembly a revival of its action and the adoption of proper steps "for ascertaining in a constitutional way the sense of the Church on the lawfulness of using instrumental worship."

IV. Reformed Presbyterian Church, Synod.—The Synod of the Reformed Presbyterian Church (O. S.) returned for 1888 112 ministers, 80 of whom were pastors; and 124 congregations, 40 of which had a membership varying from 80 to 50. An increase of five ministers and an increase of 129 members were reported. The following statistics were returned of the mission at Latakiah, Syria: Communicants (including the four ministers and the teachers), 138; schools, 27, with enrollments of 648 pupils.

The Synod of the Reformed Presbyterian Church met at Allegheny City, Pa., May 23d. A question was started at the opening of the session by the moderator's reading of the opening sermon, whether reading of sermons was proper. A motion was made to disapprove the sermon on this account. It was alleged in support of the motion that reading sermons was contrary to the traditions of the Covenant-er Church, and that to allow this innovation to remain unchallenged would be to establish a dangerous precedent. The subject was disposed of by the adoption of a resolution declaring that "the reading of certain discourses on special subjects before this court shall not be construed as a precedent for reading sermons in ordinary ministrations." A proposition looking to the abolition of tokens or tickets for communion was considered, and was met by the adoption of a paper advising all the people of the Church "to observe the custom as heretofore, until such time as the Church, in its wisdom, may deem it proper to dispense with it." A question concerning the intermarriage of converts with non-Christians, which had given trouble in the Latakiah mission, Syria, was answered with the advice that "such questions must be determined by the constitutional and statute law of the Church; and in determining particular cases, there as here, all the circumstances must be taken into account." The Presbytery of Vermont was organized, with five congregations.

V. Reformed Presbyterian Church, General Synod.—The General Synod of the Reformed Presbyterian Church (N. S.) met in Philadelphia, Pa., May 23d. The value of the endowment fund of the Theological Seminary was reported at \$33,954, while the receipts of the institution had been \$2,740, and its expenditures \$2,731. The management of the seminary was criticised in the debates. The Treasurer of the Board of Foreign Missions reported a balance on hand of \$2,220.

VI. Cumberland Presbyterian Church.—The summary of the statistics of this Church for 1888 is as follows:

Synods.....	27
Presbyteries.....	116
Ministers.....	1,489
Congregations.....	2,591
Ruling elders.....	9,270
Deacons.....	2,594
Members.....	118,750
Added on profession.....	8,613
Adult baptisms.....	6,165
Infant baptisms.....	1,458
Officers and teachers in Sunday-schools.....	8,289
Sunday-school pupils.....	56,541
Total contributions.....	\$417,998

The receipts of the Board of Publication for the year had been more than \$56,000. It was free from the debt under which it had suffered for a long time, and contemplated the publication of works by denominational authors.

The Board of Missions reported that its receipts for the year had been \$33,642, or 50 per cent. more than the receipts of the previous year. The board returned property to the value of \$31,687, while its liabilities were small. The Japanese mission had enjoyed great prosperity, and a very large relative increase of members.

The Woman's Board of Missions had received \$5,233 during the year, and \$10,141 since its organization three years before. It had three missionaries in Japan, conducted a girls' school in that country, and was about to found an orphanage at Osaka.

The fifty-third General Assembly of the Cumberland Presbyterian Church met at Nashville, Tenn., May 17th. The Rev. A. J. Mo-Glumphy, D. D., President of Lincoln University, was chosen moderator. The most important topic considered was the report upon the revision of the Confession of Faith and Government transmitting the votes of the presbyteries on the revised Confession which had been submitted by the preceding General Assembly to them (see "Presbyterians," section "Cumberland Presbyterians," in "Annual Cyclopædia" for 1882). The result of the voting was recorded as follows: 1. As to the Introduction, Confession of Faith, and Catechism: presbyteries approving, 99, of which 61 were recorded as approving unanimously; presbyteries disapproving, 8; presbyteries not reporting, 6; presbyteries submitting memorials, 4. 2. As to the constitution and rules of discipline: Presbyteries approving, 104, of which 65 approved unanimously; disapproving, 3; not reporting, 6; submitting memorials, 4. The report of the committee was concurred in, whereby the Confession as revised was declared to be the Confession of the Church. Numerous memorials and propositions suggesting amendments to the Confession were sent in, to which the Assembly answered that, in view of the fact that the subject had been so recently acted upon by the presbyteries, and their action approving the revised Confession had been so nearly unanimous, it seemed unwise to attempt at this time to determine what, if any, proposi-

tions to amend, coming from individuals, were proper or ought to be transmitted for action by the presbyteries. It therefore announced it expedient to act adversely upon all propositions coming from individuals, believing it more desirable to await expressions from the presbyteries, if any of them should desire to make suggestions. A committee which had been appointed by the previous General Assembly to consider the subject of union with the General Synod of the Lutheran Church, reported that it was not best to urge positive action now, while the Confession of Faith was undergoing revision; and that there was a growing feeling in some parts of the Church in favor of the union suggested, and a strong desire in every part of the Church for a closer fellowship with the Lutheran, and, in fact, with all evangelical churches. The prevailing impression among the members of the committees of the two churches, as represented in the minutes of correspondence adopted as a part of the committees' report, appeared to be in favor of a closer and more hearty *fraternal* union of the Cumberland Presbyterian and evangelical Lutheran churches; but the difficulties in the way of *organic* union at present existing were deemed to be insurmountable. Unless there existed a perfectly unanimous consent on the part of all the churches, on each side, the union would produce an additional number of factions. Neither body seemed to be "in a condition of gospel grace that qualifies them for organic union into one body." It was also held "that as matters in Christendom now stand, denominationalism is far more desirable than ecclesiastical concentration; that no one existing denomination is worthy of the high honor of absorbing into itself all the others." A committee was appointed to draw up a paper explaining the doctrinal status of the denomination, to be presented to the council of the Presbyterian Alliance which was appointed to be held in Belfast, Ireland, in 1884. Its report, which was adopted by the Assembly, embodies the following statement:

To the General Presbyterian Alliance, in session at Belfast, Ireland, 1884.

DEAR BRETHREN IN THE LORD: We of the Cumberland Presbyterian Church in the United States of America rejoice with you that God, by his gracious providence, seems to indicate that it is pleasing to him that the various families of the Presbyterian Church should come together for fraternal counsel as to the interests of his kingdom.

Claiming to be one of these families which God has raised up for the spread of the gospel of his dear Son, and having approved the Constitution of the Alliance (see Minutes of our General Assembly, 1881, page 84; and 1882, page 18), we send brethren bearing commissions with the signature of our Moderator and Clerk, as delegates to your body, and through them said Minutes and our Confession of Faith and Government, that by reference thereto you may decide whether we come within the pale of the consensus of the doctrines of the Reformed Churches.

In our Confession of Faith you will find our doctrines stated in the following order:

The Holy Scriptures, the Holy Trinity, the Decrees of God, Creation, Providence, the Fall of Man, God's

Covenant with Man, Christ the Mediator, Free-Will, Divine Influence, Repentance unto Life, Saving Faith, Justification, Regeneration, Adoption, Sanctification, Growth in Grace, Good Works, Preservation of Believers, Christian Assurance, the Law of God, Christian Liberty, Religious Worship, Sabbath-Day, Lawful Oaths and Vows, Civil Government, Marriage and Divorce, the Church, Christian Communion, the Sacraments, Baptism, the Lord's Supper, Church Authority, Church Courts, Death and the Resurrection, and the Judgment.

It is well known to the religious world that our Confession of Faith and Catechism are revisions of the Westminster Confession of Faith and Shorter Catechism, expressing our understanding of the teachings of God's Word.

Now, dear brethren, if the difference between our statements of doctrine and those of the Westminster Confession of Faith is inconsistent with our being represented in your body, you will so decide.

A memorial was presented asking that steps be taken toward a reunion with the Cumberland Presbyterian Church (colored); to which the Assembly replied that as the organization of the colored Cumberland Presbyterian Church had been made at the request of a convention of colored ministers, it would not be equitable, while they were free to move in such a matter, for the present Assembly to move first. Moreover, the experience of those churches that had most largely succeeded among the colored people justified the conviction that a greater success could be reached by an independent organization. The memorial was not granted, but the sympathy of the Assembly was tendered and all assistance in its power was promised to aid and encourage the colored brethren in their work, especially in that of an educational character. Attention was called to the increasing desecration of the Sabbath, and prompt discipline was recommended to be administered to all church-members offending in this matter. The Assembly's Board of Trustees reported that a bequest of \$17,000 from John P. Finley, and a bequest of \$10,000 from John A. Dougherty, were available. The money was devoted to the cause of ministerial education. A fraternal letter was received from the Evangelical Union of Scotland in which was a clause congratulating the Assembly upon the success of its revision of the Confession of Faith, and the thoroughness with which "Westminsterism"—to borrow the somewhat novel and expressive term of the revisers—has been eliminated by the Revising Committee."

VII. *Presbyterian Church in Canada.*—The following is a summary of the statistics of this Church as they were presented to the General Assembly in June: Number of pastoral charges, 799; of congregations and stations, 1,011; of churches, stations, and mission-stations supplied by pastors, 1,714; of families connected with the Church, 69,507; of communicants, 119,608; of sittings in churches, 350,432; total amount of stipends paid, \$553,393; total amount raised for the schemes of the Church, \$167,384; total income of the Church, \$1,422,783.

The Committee on Home Missions reported to the General Assembly that its receipts for

the year had been \$43,401, and that it had a balance in its treasury of \$1,406.

The Board of French Evangelization had received \$32,606. It had thirteen schools, with 19 teachers and 533 pupils.

The Foreign Mission Committee, Western section, had received \$40,111. A favorable report was made of the mission among the Indians in the Northwestern Territories, and those people were represented as making satisfactory progress in the arts of civilization. There were connected with these missions 26 chapels and as many native agents, and 140 converts had been gained during the year. The Eastern section of the committee had supported a mission in Trinidad at an expense of \$18,000, of which \$3,000 had been contributed from Canada. A mission in India was prosperous; and, in the New Hebrides, 33 teachers were employed, and 195 communicants were enrolled.

The amount of the aged and infirm ministers' fund (Western section) was \$8,692, and the number of beneficiaries on its roll was 32. The receipts of the Eastern section of the fund had been \$2,312.

The widows' and orphans' fund, of which four separate accounts are kept, amounted in all to \$265,580.

This Church sustains six theological schools and colleges, as follow: Presbyterian College (theological), Halifax, N. S., 3 professors, 15 students in 1882; Morrin College, Quebec, 5 professors, 51 students; Presbyterian College, Montreal, 3 professors, 7 lecturers, 72 students; Queen's College and University, Kingston, 7 professors, 2 lecturers, 202 students; Knox College (theological), Toronto, 6 professors and teachers, 37 students; Manitoba College, Winnipeg, 5 instructors, 55 students.

The General Assembly of the Presbyterian Church in Canada met in London, Ont., June 13th. The Rev. John A. King, D. D., was chosen moderator. Action was taken naming \$750, with a manse, as the amount which the Church should aim to secure as the minimum stipend of ministers in pastoral charge. The principle of the "Scott" liquor act of 1878 was approved "as an important means of limiting the liquor-traffic and educating the people for total prohibition"; members were advised to encourage the establishing of coffee-houses and temperance hotels, and ministers to preach on temperance on some suitable day. A remonstrance was ordered addressed to the managers of railroads against the desecration of the Sabbath on their lines; and the Assembly's committee was authorized to correspond with similar committees of other churches with a view to united action for enforcing the existing Sabbath laws. In connection with this subject, it was mentioned that six Presbyterian young men had recovered damages for wrongful dismissal because they would not work for contractors on one of the railroads on Sunday.

VIII. Church of Scotland (Established).—The General Assembly of the Established Church

of Scotland met in Edinburgh, May 24th. The Rev. Dr. John Rankine, of Sorra, was chosen moderator. The Committee of Presbyterial Superintendence reported that the entire number in the roll of communicants could not be less than 530,292, or 14,506 more than were returned in 1878. The whole number of persons in Sunday-schools was 261,000. The Committee on Christian Liberty reported that the entire amount of contributions for 1882 to the funds and schemes of the Church had been £386,061, or £44,698 more than the contributions for 1881. The Endowment Committee reported the expenditure during the year of £38,000 in the endowment of 11 parishes, making the whole number of 328 parishes endowed and erected since its commencement. The Committee of the Aged and Infirm Ministers' Fund reported the capital of the fund at the end of 1882 to be £10,772. The income of the Home-Mission Committee had been £9,504. The committee had assisted 50 mission stations and 71 mission churches, connected with which were 11,727 communicants and 22,130 attendants; it had also aided in the building or enlarging of 22 churches, in which 9,176 additional sittings were provided. The income of the Foreign Mission Committee had been £25,022, and its expenditure £23,828. The Jewish Mission Committee returned an income of £5,392, and reported 2,233 pupils in its 11 schools. An overture having been presented, calling attention to the absence of a uniform rule in regard to the admission of ministers from other churches, a motion was offered to the effect that the Assembly instruct the committee on the reception of such ministers to see that applicants furnish evidence that they had received such ordination as was required by the Confession of Faith and the Constitution of the Church. The overture and resolution were rejected. Respecting the clause in the Universities (Scotland) Bill pending before Parliament, which provides for the abolition of tests in the case of the theological chairs, the Assembly resolved, by a vote of 176 to 52, to petition against the clause, while it still expressed willingness "to give favorable consideration to any modification of the existing condition of appointment to theological chairs, which would still leave satisfactory security that the theological teaching in the universities shall continue to be in harmony with the doctrinal standards of the Church of Scotland." The Temperance Committee reported the number of members in the Church of Scotland Associations to be 4,000, with 7,500 children in Bands of Hope, and said it was evident that "the temperance platform of the Church of Scotland must not be more narrow than the terms of communion in the Church," and that it had been its aim "to unite all the members of the Church against the evils of drunkenness."

IX. Free Church of Scotland.—The General Assembly of the Free Church of Scotland met in

Edinburgh, May 24th. An important debate took place on the subject of the use of instrumental music in worship, respecting which three motions were presented. The first was contained in the report of the committee to which the subject had been referred, brought forward by Dr. Adam, and was to the effect that the introduction of instrumental music is not contrary to Scripture or to confessional law, and that liberty in the matter should be granted to the congregations. The second motion was by Principal Rainey, and embodied the substance of the former resolution; with the additional recommendation, in deference to numerous protestations, that all congregations and church courts should carefully consider the interests of peace and harmony. The third resolution was by Sir Henry Moncrieff, and advised that the report of the committee, with the accompanying documents, be given to the Church for consideration, and that, in the mean time, the Assembly take no action. A protest was lodged by Dr. Begg on behalf of himself and his friends, who supported Sir Henry Moncrieff's resolution, to the effect that, in taking part in the debate, they did not concede that it was competent for the Church to sanction in any form the use of organs in praise. The resolution of Dr. Rainey prevailed by a vote of 390 to 259. An expression was adopted, by a decided majority, in favor of relieving the deacons from the obligation to sign the "Confession of Faith."

X. United Presbyterian Church of Scotland.—The number of congregations on the roll of the synod of this Church for 1882 was 551. The statistical reports showed an increase of 1,742 in the total membership. The total income of the Church had been £377,717. The available income of the foreign mission fund had been £31,259, and the expenditures on its account £36,694. The missions—in Jamaica, Trinidad, Old Calabar, Caffraria, Spain, India, China, and Japan—returned 50 ordained European and 17 ordained native missionaries, a total of 487 educated agents, and 71 stations and 156 out-stations, with 10,808 communicants, and 12,524 pupils in 199 schools. The synod, at its annual meeting, reiterated its declarations in favor of the disestablishment of the State Church, affirming the spiritual independence of the Church and the sole headship of Christ. Interest was expressed in the movement for the union of the United Presbytery of Caffraria, South Africa, with the Free Church Presbytery, and the proposed basis of the union was approved.

XI. Presbyterian Church in Ireland.—The reports of this Church show a decrease of 485 in the number of communicants. The total income of the Church for the year was £746,045.

In the General Assembly resolutions were offered condemning the ministers of those congregations which continue to use instruments in public worship, and directing the appointment of a commission with power to deal with

such ministers in the event of their continued disobedience, in accordance with the laws of the Church on contumacy. An amendment was offered to the resolution, to the effect that, in view of all the circumstances and the gravity of the issues involved, the Assembly decline to appoint a commission to proceed in the matter, or to take any steps which will involve discipline or a rending of the Church. After an active debate, the amendment was adopted by a vote of 320 to 309 votes for the original resolution.

XII. Presbyterian Church in England.—The Synod of this Church embraces, according to the statistical reports submitted to it at its meeting in June, 1888, 279 congregations, with 57,402 members. The total revenue of the synod for the year was £235,662, and the property held by the Church was valued at £1,244,000, less £107,400 of indebtedness.

The contributions of the Church during the year for foreign missions had been £8,500. The missions were chiefly in China, and returned 19 ordained European missionaries, five medical missionaries, five woman-missionaries, besides wives of missionaries, and a staff of native evangelists, with 2,570 communicants.

The Synod of the Presbyterian Church in England met in London, May 3d. The Rev. Dr. Edmond was chosen moderator. The principal subject considered was that of the modification of the creed in such a way as to make it more intelligible to the people of the present time. A motion was adopted to the effect that the synod, "recognizing the gravity of the matters thus brought under its notice," and "while affirming its unabated adherence to the doctrine contained in the Westminster Confession," consider (1) what changes may be made in the existing formulas, by which office-bearers affirm their adherence to the Confession; (2) the desirability of preparing an explanatory declaration; and (3) whether, with a view to secure some briefer and more available compendium of fundamental doctrine, the Church might not approach the Pan-Presbyterian Council to meet in Belfast next year, by memorial or otherwise, suggesting the drawing up of a digest of doctrine designed to embody the "Consensus of the Reformed Confessions," on which the said Council is based. The union thanksgiving fund, which the synod had been collecting for several years in commemoration of the union of the different branches of the Presbyterian denomination in England, by which the Church had been formed, now amounted to £144,147.

PRESIDENT'S MESSAGE. See page 157.

PRINCE EDWARD ISLAND, a province of the Dominion of Canada, in the southern part of the Gulf of St. Lawrence, separated from New Brunswick and Nova Scotia by Northumberland strait. Area, about 2,000 square miles. Capital, Charlottetown.

Soil and Climate.—The soil is good, and two thirds of the exports are agricultural products.

Nearly the whole island is under cultivation. The climate is agreeable, especially in summer. The ranges of the thermometer are not extreme, owing to its insular character. Very little wheat is grown, but this is owing to the extreme moisture of the atmosphere.

Towns and Ports.—Charlottetown, the capital, on Hillsboro Bay, is the largest town on the island; its population is 11,484; Summerside, 2,853, is connected with Shediac, N. B., by a ferry; Georgetown, at the western extremity of the island, has a population of 1,200, and is also a packet-station. The minor ports are Alberton, Princetown, and Souris.

Industries.—The agricultural exports in 1882 amounted to \$1,021,844, of which \$630,185 was oats, and \$368,911 potatoes. Vegetables valued at \$13,787, and hay at \$6,320, make up the greater part of the remainder. These exports are nearly equally divided between the United States and Great Britain.

The export value of products of the fisheries was \$541,585. Of this, \$420,430 is on account of lobsters, shipped chiefly to Great Britain; \$81,855 of mackerel, shipped to the United States, and \$12,264 of codfish. The product of animals amounts to \$181,981, of which \$66,927 was eggs, to the United States; \$14,409, sheep; \$9,696, cattle; and \$13,722, butter. Beef, pork, hides, and horses make up the remainder. The manufactures include ships, \$107,367; leather, \$4,256; and starch, \$2,680. The entire exports of Prince Edward Island manufactures amounted only to \$118,930. The product of the forest exported amounted only to \$20,098, chiefly lumber.

Education.—The schools are free. The education department has been under the control of a chief superintendent since 1877, and there is a Provincial Board of Education. The salaries of teachers are paid chiefly from provincial funds. They range, in the case of first-class teachers, from \$300 to \$1,000 for male teachers. Female teachers holding first-class certificates receive on an average \$360 per annum. There were 468 teachers employed in the public schools in 1882—256 males and 212 females. The attendance in the same year was 21,269. The total expenditure for education in 1882 was \$130,446.96, of which \$98,476.48 was paid for teachers' salaries. There were 60 teachers in training in the normal department of the Prince of Wales College at the close of 1882, and 33 non-professional students. These institutions were united in 1879, in which year the college was also thrown open for ladies. The Roman Catholics maintain St. Dunstan's College for the higher education of members of that denomination.

PROHIBITION. The idea of prohibiting the use of or traffic in intoxicating liquor, in some form or to some degree, is as old almost as that kind of liquor itself.

Early History.—Intemperance, from the earliest days of history, has periodically required some check upon its progress, which religious

or civil authority has duly presented. The Scriptures contain many proofs of the excessive use of wine, even among the chosen people. Confucius gave sage advice against a like use thereof in China, almost 500 years before Christ. Herodotus, writing about the same time, referred to a liquor drawn from barley, by fermentation, as in common use among the Egyptians. Pliny speaks of 195 kinds of wine used in Rome. Tacitus, describing the manners and customs of the Germans in his day, notices their drunken broils from the excessive use of beer. The ancient Britons produced from grain "a pleasant, warming, and strengthening beverage," which they called *curmi*, and of which they drank lavishly. Every people, of historical account, have had their favorite strong drink, fermented or distilled.

The earliest forms and applications of prohibition were ecclesiastical and personal, and were imposed mainly upon liquor-drinking rather than upon liquor-vending. Ancient Scripture tells of Nazirite and Rechabite, who were forbidden to use wine or strong drink. The Indian Vedas, though allowing wine as an oblation to the gods, forbade its use as a beverage; and Sukracharaga, a high-priest of the Assurus, declared the most rigid prohibitory law. Buddhist and Brahman monks were bound to abstain wholly from intoxicating drinks; and on all the followers of Buddha abstinence therefrom was rigidly enjoined. Intoxicating wine was forbidden in Egypt, both to priest and king; and from the accession of Menes to the reign of Psammethichus, 600 B. C., a period embracing twenty-five dynasties, total abstinence from intoxicants was taught and practiced by them. The Egyptian priests observed personal prohibition even down to the time of Nero. Mohammed said, "Of the fruit of the grape ye obtain an inebriating liquor, and also good nourishment"—the former he interdicted, the latter he allowed.

The first civil law against the manufacture of intoxicating liquor, of which there is any record, was promulgated in China, 1100 B. C. It was an imperial edict called "The Announcement against Drunkenness," and directed that "the people" who drank should be put to death. A little of the spirit of it abides in one of the present Chinese enactments, which says, "A man who, intoxicated with liquor, commits outrages against the laws, shall be exiled to a desert country, there to remain in servitude." Among the ancient Mexicans intemperance was accounted a grievous crime, and was punished with the severest penalties. Charlemagne tried by imperial edicts to stop the drinking habits of the early Germans. According to Lecky, one of the safeguards established to preserve female purity in Rome was an enactment forbidding women even to taste the juice of the grape; and this law, ingrafting itself upon early domestic education, became, by habit and tradition, so incorporated with the moral sense of the people, that its violation

was considered monstrous, and Cato could speak "of any shameful act" on the part of a wife, "such as drinking wine or committing adultery." Cato further says that his countrymen were accustomed to kiss their wives, for the purpose of discovering whether they had been drinking; and Pliny, who ascribes to Romulus the authorship of this prohibitory law as applied to women, mentions two instances in which offending wives were put to death for their transgressions. Later, Seneca made bitter complaint of the drinking habits of women; and the prohibition had grown quite obsolete in the time of Tertullian. In the early days of Rome, wine was also forbidden to men until their thirtieth year.

According to Hector Boëtius, the sellers of strong drink, in the earlier ages of Scottish history, were looked upon as public enemies, who, for profit, enticed men to a vicious life; and Argadus, administrator of the realm, A. D. 160, confiscated their goods, pulled down their houses, and banished them. At a later period, when the evils of drink had revived, Constantine II re-enacted this law (A. D. 861), adding the penalty of death, "in case the tavernier refused to depart, or resisted the execution of the decree." In the reign of Philip and Mary an act was passed suppressing in Ireland the traffic in *builcann*, a spirit distilled from fermented black oats, its manufacture being regarded as a sinful and dangerous destruction of the food of the people.

Between the fifth and the fifteenth centuries, when the Church of Rome bore absolute sway over England, Ireland, and Scotland, many laws, enactments, decrees, canons, and pastorals were leveled at intemperance. One of the canons enacted by the bishops, in synod assembled by St. David, A. D. 569, affirmed that "he who forces another to get drunk, out of hospitality, must do penance, as if he had got drunk himself." Under St. Dunstan it was ordered that no drinking should be allowed in the church. Soon after (A. D. 970) a canon was passed forbidding priests to drink in taverns like laymen. Still later (A. D. 1215) the clergy, both of England and Ireland, were strictly forbidden to frequent taverns.

The brewing and selling of ale and mead became a considerable business in Scotland and England at a very early day, but from the first it was regulated, restricted, or partially prohibited by Government. The earliest recorded excise was a tax of fourpence, paid in Scotland for a yearly license to brew and sell ale; and prohibition was linked with it by the one licensed being forbidden to carry the ale into another town for sale. All public officials were prohibited from brewing for sale; and public tasters were appointed, to test and appraise the ale sold, most of which was brewed by women. Any woman might brew who should pay the tax; but she must brew the whole year through or forfeit her permit; and she must "put her ale-wand outside her house,

at her window or above her door," or be subject to fine. Ale-drinking increased rapidly, and in A. D. 728 public booths were erected, wherein to sell the popular drink. In the latter part of the tenth century King Edgar put down all ale-houses, except one in each borough or small town. The price of ale was regulated by the Norman kings, and by statute (A. D. 1272) it was ordered that a brewer should sell two gallons for one penny, in cities, and three or four for that price in the country. In the reign of Edward I (A. D. 1285) it was enacted that taverns should not be open for the sale of wine and beer after the tolling of the curfew; and in the reign of Edward III but three taverns were allowed in the metropolis. Hop plantations were established in 1552, and were accorded special privileges in the fifth year of Edward VI; and in 1649 the city of London petitioned Parliament against "hoppers," urging that "this wicked weed would spoil the drink and endanger the lives of the people." In 1552 power was given to justices of the peace to abolish ale-houses, and it was ordered that none should be opened without license; two years later taverns for the sale of wine were limited by act of Parliament to a certain number in the different cities, London being allowed forty, and none was permitted to be sold to be drunk on the premises; and in 1643 a tax was laid upon home-made ale and beer, which was then first called an excise-tax. The same statute imposed an excise of twopence a gallon upon *agua vita*, or strong waters, distilled within the Commonwealth, which revenue was granted Charles II, and continued to his successors, with various modifications, until 1880, and since then upon nearly all alcoholic liquors. In 1689 the importation of spirits was prohibited, and distillation, not known in Europe until the thirteenth century, was thrown open to all English subjects. At once the increase of distilled liquors became enormous, their consumption kept equal pace, and within fifty years drunkenness was an acknowledged national curse. Gin took the place of ale everywhere, to an alarming extent; and a common advertisement among the retailers of it was, "Drunk for a penny—dead-drunk for twopence. Clean straw for nothing." Lecky says that this fact of gin-drinking, small as it appears in English history, was probably the most momentous of the eighteenth century. It brought on an era of frightful intemperance, which vigorous parliamentary measures did not terminate. Between 1684 and 1786 the distillation of spirits rose from half a million gallons to 5,894,000 gallons, and this increase was scarcely checked by imposing a duty of twenty shillings a gallon on all spirituous liquors, and by prohibiting their sale in less quantities than two gallons, without paying £50 a year tax, in the latter year named. The law was not enforced, but fearful riots followed its attempted enforcement. Crime and immorality of all descrip-

tions multiplied. In 1751 the consumption of spirits had reached over 11,000,000 gallons. Then more stringent measures were tried, with marked effect. Distillers were prohibited, under a penalty of £10, from either retailing spirituous liquors themselves, or selling them to unlicensed dealers; debts contracted for liquors, not amounting to twenty shillings at a time, were made irrecoverable by law; licenses were greatly limited; the penalties for unlicensed selling were much increased: for a second offense the offender might be imprisoned and whipped, and for the third he was liable to transportation. But in spite of all this the traffic did not remarkably diminish.

In the United States.—In this country, the worst forms of liquor-selling were prohibited in colonial times; and partial prohibition early prevailed. In the town records of East Hampton, Long Island, is an order of a town-meeting, "That no man shall sell any liquor but such as are deputed thereto by the town"; and in 1655 the authorities interfered between the neighboring Indians and their drink with prohibitory provisions. As given by Bancroft, the summary of a new Constitution for Virginia, under date of 1676, has a prohibitory clause as follows: "The sale of wines and ardent spirits was absolutely prohibited (if not in Jamestown, yet otherwise) throughout the whole country."

Distillation began in Boston in 1700, with the making of New England rum from West India molasses; and four years later whiskey-making, from rye, began in Western Pennsylvania. In less than 100 years there were 40,000 distilleries in the United States, and the results thereof had excited sober concern. On Feb. 27, 1777, the following resolution was passed by the first Continental Congress, then sitting in Philadelphia:

Resolved, That it be recommended to the several Legislatures in the United States immediately to pass laws the most effectual for putting an immediate stop to the pernicious practice of distilling grain, by which the most extensive evils are likely to be derived, if not quickly prevented.

There is no proof that this recommendation bore fruit, though in 1788 the Legislature of New York passed an act "to lay a duty on strong liquors, and for the better regulation of inns and taverns." It provided that the Commissioners of Excise should not grant permits to any person to sell strong drink and spirituous liquors, for the purpose of keeping a tavern, unless it should appear to them that such an inn or tavern was necessary for the accommodation of travelers. Good character, and a recognition not to keep a disorderly house, were also required. April 7, 1801, a more stringent bill passed the same body, which prohibited the sale of spirituous liquors by retail, or to be drunk in the house of the seller; restrained and limited the power of Commissioners of Excise; and made each violation of its provisions a misdemeanor. In December,

1790, the College of Physicians in Philadelphia memorialized Congress, declaring "that the habitual use of distilled spirits, in any case whatever, is wholly unnecessary," and asking Congress "to impose such heavy duties upon all distilled spirits as shall be effectual to restrain their intemperate use in our country."

In 1794 Dr. Rush's "Medical Inquiries" attacked the common professional belief in the virtue of alcohol as diet, and in its prophylactic power as medicine; and, as a consequence of the agitation which followed, the first temperance society of modern times was organized April 18, 1808, in Moreau, Saratoga co., N. Y., entitled "The Union Temperate Society of Moreau and Northumberland." Like the Massachusetts Society for the Suppression of Intemperance, formed in 1813, it did not aim at total abstinence, but to discountenance "the too free use of ardent spirit." Feb. 18, 1826, the American Temperance Society was organized in Boston, and in a manifesto, issued the following month, its Executive Committee declared for the total prohibition of distilled liquors. Temperance societies were formed all over the country, numbering above 7,000 in five years, with a membership of 1,250,000. A Congressional Temperance Society was among these. Great enthusiasm prevailed everywhere, culminating in the Washington movement of 1840, which carried total abstinence on a strong tide of popular feeling from State to State. It was prohibition of the individual by the individual. No longer could it be said, as forty years before, that Americans were the most drunken people on the face of the globe, because of national revenue sought from spirits, to pay a national debt resulting from war.

The License Question.—But while thousands pledged themselves to abstain from strong drink, and pledged men were enthusiastically rallying into organizations, the dram-shop held place as a necessary evil, recognized as such, and legalized. No-license did not compel general consideration till 1832, and was adopted then but here and there. The city of New York largely reduced the number of retail licenses in 1819, and next year the mayor testified to an improved condition of morals there, and imputed the same "to the suppression of so many of these poison-shops, where a man might buy rum enough to make himself beastly drunk for six cents." The era of no-license fairly overlapped on the era of organization, the former beginning a decade before the latter may be said to have ended. Dr. Lyman Beecher, in his famous sermons on "The Nature and Remedy for Intemperance" (1826), had proclaimed a national remedy needful, "the banishment of ardent spirits from the list of lawful articles of commerce." Dr. Justin Edwards, in a report of the American Temperance Society (1833), had said, "The point to be decided is, shall the sale of ardent spirits, as a drink, be treated in legislation as a virtue, or a vice?" In 1838 the question was

publicly debated in the city of New York, "What right have legislators to pass laws which enable men legally to injure their fellow-men, to increase their taxes, and expose their children to temptation, drunkenness, and ruin?" "The law which licenses the sale of ardent spirits," said Judge Platt, in the same year, "is an impediment to the temperance reformation; . . . and when the public safety shall be thought to require it, dram-shops will be indictable, at common law, as public nuisances." No-license appears to have been successfully established in the old colony of Massachusetts in 1832; only two criminals were tried in Barnstable and Dukes counties throughout 1835, or the larger part of that year. Georgia took it up in 1834, and expelled the traffic from two counties. Massachusetts extended it through two additional counties, and in numerous towns of that State licenses were withheld. Connecticut caught the no-license enthusiasm in 1844, and elected commissioners accordingly in 200 out of 220 towns. A year later, four fifths of the towns of New York voted strongly for no-license; and it was recorded of Massachusetts that from more than 100 towns the traffic was entirely removed.

State Prohibition by Statute.—Local prohibition, by towns and municipalities, led naturally to the thought of State prohibition under general law. Maine began the agitation concerning it, and the first legislative attack on the liquor traffic was made in the Maine Legislature in 1837, when Gen. James Appleton presented a memorial demanding the abolition of all license laws, and the entire prohibition of liquor-selling "except for medicine and the arts." A prohibitory bill, according with this demand, was defeated. In 1838 Tennessee enacted a law which prohibited the retailing of drink in quantities less than one quart; and the same year a convention of 400 delegates, in Massachusetts, organized a total-abstinence State Temperance Society, and presented to the Legislature a petition asking: "Is it right to give authority to sell insanity and deal out sure destruction? If it is right, why should any be forbidden to do it? If not right, why should any be permitted to do it?" The Legislative committee recommended prohibition; and a bill was passed prohibiting the sale of spirits in less quantities than fifteen gallons. Mississippi enacted the one-gallon law in 1839; and Illinois granted power to towns and counties to suppress the retail traffic, on petition signed by a majority of the male inhabitants. The next five years might be called the local-option era, since many of the States made local prohibition possible by popular vote. As local option appeared democratic in idea, it met with comparatively little legislative opposition.

Maine, first to attack the liquor-traffic by legislative memorial, passed the first general prohibitory law in 1846, which year ended the local-option era. This law failed, as has been said, "because it was not as thorough in its

apparatus as in its principle." Delaware followed with a similar law in 1847; but this was submitted to and ratified by the people, and was then declared unconstitutional by the Supreme Court, because of such submission. In 1849 the temperance men of Maine, under the leadership of Neal Dow, carried the elections, and on June 2, 1851, by a vote of two to one, the first prohibitory law was superseded by the "Maine law," as it was soon denominated, drafted by Mr. Dow. He declared confiscation of the liquor as the practical correlative of the principle of prohibition, and this law embodied "search and seizure" provisions which rendered it effective. Under it the first seizure was made at Bangor, July 4th of the year the law passed, and a second followed in Portland shortly after, where \$2,000 worth of liquor was destroyed in presence of a great crowd of people. In May, 1855, the Maine law caused a mob in Portland, the military were called out, and one of the rioters was killed and several wounded. At the next election the Prohibition party failed to secure its necessary plurality of votes, and in 1856 a Democratic Legislature repealed the prohibitory law, and substituted a stringent license law in place of it; but after two years' experience with increased crime, pauperism, and disorder, Maine re-enacted prohibition by a legislative measure submitted to the people, and ratified by a majority vote of 22,952. The only subsequent change in that law has been to render it more rigorous.

Following the lead of Maine and partially patterning after the Maine law, prohibition was enacted in Minnesota (1852), Rhode Island (1852), Massachusetts (1852), Vermont (1852), Michigan (1853), Connecticut (1854), Indiana (1855), Delaware (re-enacted 1855), Iowa (1855), Nebraska (1855), New York (1855), New Hampshire (1855), and Illinois (1855). Of the fourteen Legislatures which thus enacted prohibition in four years, eight were Democratic, four Whig, and two American; two of the Democratic and one of the Whig having anti-Nebraska members on the dominant side. In only two of these States has the prohibitory law stood until now—Vermont and New Hampshire. In six it was declared unconstitutional—Delaware, Rhode Island, Massachusetts, Michigan, Indiana, and New York. In Connecticut it was repealed. In Iowa a "wine-and-beer clause" afterward rendered it largely inoperative. In Illinois it failed of approval by the people. It was announced in 1856 that prohibition had driven the open liquor-traffic out of three fourths of Massachusetts; and in the city of Lowell, in one year, it caused a diminution of 77 per cent. in the recorded cases of drunkenness. In Connecticut Gov. Dutton said, "The home of the peaceful citizen was never before so secure"; and the Mayor of Providence, after three months of the law in Rhode Island, published statistics showing that the commitments had been reduced nearly 60 per cent. In Vermont the State's

attorney of Chittenden county, writing from Burlington, said, "The law has put an end to drunkenness and crime almost entirely." In New Hampshire several counties reported (1856) their jails tenantless. In New York, where the opposition was greatest, the law was declared by Gov. Clark to have been generally obeyed outside the great cities; and in Albany, Syracuse, Auburn, Utica, and Rochester, the police committals for offenses other than drunkenness, in six months only, were decreased 1,910. New York had prohibition but a short time before its unconstitutionality was declared by the Supreme Court, not because of its principle, but because the act did "not express itself with sufficient specificness and discrimination"; and in 1857 a license law was enacted, prohibitory as to selling to Indians, minors, and habitual drunkards, also as to selling on Sunday. With some modifications, rendering it no less prohibitive in character but more easy of evasion, it has continued until now.

The prohibition era ended in 1856, when slavery came to the front, as a great moral and political question, and overshadowed temperance. Special work to secure the enactment of prohibitory laws ceased in 1855, and active effort to hold these laws and secure their enforcement lasted but a year or two longer in most of the States. Five years of anti-slavery agitation followed the decade of anti-liquor agitation, and four years of civil war spread the drink-habit disastrously. License had become the prevailing State policy, with such partial prohibition as the traffic would permit. The distilling and brewing interests had swelled to enormous proportions. During the last year of the war, the revenue to Government from distilled and fermented liquors multiplied almost fourfold. Intemperance was more general than at any time before in two generations. Anti-liquor agitation began again, both reformatory and political, incited largely by the beer-brewers, who were resolved upon removing all restrictions from fermented liquors, and doing away in particular with Sunday prohibition. At the seventh Beer-Brewers' Congress, held in Chicago, June 5, 1867, they declared "the action and influence of the Temperance party" in "direct opposition to the principles of individual freedom and political equality," and—

Resolved, that we will use all means to stay the progress of this fanatical party, and to secure our individual rights as citizens, and that we will sustain no candidate, of whatever party, in any election, who is in any way disposed toward the total-abstinence cause.

There was at this time no Prohibition party, national or State; there had been none; and the "Temperance party" here referred to was but the unorganized mass of temperance voters, in both political parties, who carried their principles into the elections as opportunity offered. These men, represented in the Sixth National

Temperance Convention, held in Cleveland, Ohio, July 29 and 30, 1868, accepted the issue, and resolved, "that temperance, having its political as well as moral aspects and duties, demands the persistent use of the ballot for its promotion," and the convention, in the same resolution, urged "the friends of the cause to refuse to vote for any candidate who denies the application of the just powers of the civil government to the suppression of the liquor-traffic," and exhorted "the friends of temperance, by every practical method in their several localities, to secure righteous political action for the advancement of the cause."

A National Movement.—The idea of a national Prohibition party was broached during the session of the Right Worthy Grand Lodge of Good Templars, held in Oswego, N. Y., May 25, 1869, and a committee was appointed to issue the call. Pursuant thereto, nearly 500 delegates, representing twenty States, assembled in Chicago, September 1st of the same year, organized the National Prohibition Reform party, and adopted an address by Gerrit Smith. The first nominating convention of that party was held at Columbus, Ohio, Feb. 22, 1872, adopted a comprehensive platform, and nominated for President, James Black, of Pennsylvania; for Vice-President, John Russell, of Michigan. State organizations auxiliary followed the Chicago Convention, beginning with Ohio, in 1869, and the nomination there of the first distinctively Prohibition ticket, for which 679 votes were cast. In 1870 the party's vote, in five States, was 17,401; a year later it reached 17,127 in six States; in 1872, the presidential ticket received 5,508 from six States; the next year six States gave 22,737; in 1874 ten States counted 46,025; and the next year twelve States gave 51,986, Pennsylvania leading with 18,244, followed by New York with 11,108, Rhode Island with 8,724, and Massachusetts with 9,124. The second national nominating convention of the party was held in Cleveland, Ohio, May 17, 1876, with an attendance of about 100 delegates, from twelve States. It nominated for President, Green Clay Smith, of Kentucky; for Vice-President, Gideon T. Stewart, of Ohio; and they received 9,757 votes in seventeen States, while the State tickets, in ten States, received 26,014. In 1877 seven States polled 55,779, considerably more than have been recorded since, with the exception of 1882, when the aggregate, in thirteen States, reached 98,768, New York leading with 25,768. The national ticket, in 1880—Neal Dow and Henry A. Thompson—had but 10,805. Twenty of the States have had Prohibition tickets, one year or more, since the party was first organized. The largest vote cast by any of them was that of New York in 1882. But, small as these figures appear, prohibition has entered largely into State and national politics since 1870. Both the Democratic and Republican parties have pronounced upon it. In their National

Convention of 1872, at Philadelphia, it was declared:

The Republican party proposes to respect the rights reserved by the people to themselves as carefully as the powers delegated by them to the State and to the Federal Government. It disapproves of a resort to unconstitutional laws for the purpose of removing evils by interference with rights not surrendered by the people to either State or national Government.

Mr. Herman Raster, who wrote this, avowed it to mean "the discountenancing of all so-called temperance (prohibitory) and Sunday laws." The Democratic party, nationally at St. Louis in 1876, and at Cincinnati in 1880, as also by State conventions in many States, declared its opposition to all "sumptuary laws." In 1876 a bill passed the Senate of the United States to provide for a commission of inquiry "in reference to the question of revenue from the manufacture and sale of alcoholic and fermented liquors, and the effect of the use of such liquors upon the morals and welfare of the people"; but it was defeated in the House of Representatives. The same measure has passed the Senate four times since, with uniform failure in the House; and the beer interest has kept an attorney in Washington to insure its defeat.

Prohibition by Constitutional Amendment.—On Dec. 27, 1876, Hon. Henry W. Blair, of New Hampshire, introduced in the House of Representatives a joint resolution to amend the Constitution of the United States by prohibiting, "from and after the year of our Lord 1900, the manufacture and sale of distilled alcoholic intoxicating liquors," providing that on the last day of December, 1890, the same should have been ratified by three fourths of the States, and supported the measure in a speech covering the entire question. Mr. Blair has since kept this national amendment before the Senate.

State constitutional prohibitory amendments came to be considered soon after the national amendment was first proposed. The Woman's Crusade (1873-'74), purely moral and spiritual in its agencies, persuasive in its efforts, and marvelous in its immediate results, had not permanently checked intemperance. The Reform Club movement, with all its blue-ribbon enthusiasm, did not close the saloons, or hold in total-abstinence ranks a large percentage of the men swept into it. The Woman's Christian Temperance Union, allied therewith, was almost powerless in presence of a legalized traffic, potent in politics and protected by law. The Prohibition party was ill organized where it existed, of meager membership, and only stood as a weak protest against a mighty power. How to apply the ballot, under existing political conditions, and make it effective for prohibition, was a problem which the amendment plan appeared to solve. It took the question out of party politics, and separated it from the entanglements of party necessities. It arrayed men on one side or the other of a direct issue. Kansas began the

open fight for State constitutional prohibition. For five years previous the work of moral temperance reform had there been vigorously carried on, with prohibition as the ultimate end sought. The Governor, John P. St. John, was a Republican Prohibitionist. In 1879 many restrictive bills were before the Legislature, and these finally gave way to an amendment adding section 10 to Article XV, as follows:

The manufacture and sale of intoxicating liquors shall be forever prohibited in this State, except for medical, scientific, and mechanical purposes.

This was passed by the Legislature, March 5, 1880, with barely a two-third vote in the lower House, and went to the people for ratification on the 2d of November. Gov. St. John led the amendment campaign, and had the co-operation of many able and active workers, organizers, and lecturers, from other States. The liquor-manufacturers organized secretly, and used every means in their power to stay the temperance tides. Prohibition was adopted constitutionally by a majority of 7,998 in a total vote of 176,606, and enforcing statutes were enacted by the Legislature. The Republican party renominated Gov. St. John, in 1882, for a third gubernatorial term, by almost the entire vote of the nominating convention; but he was defeated at the polls by about the majority which prohibition had received, though his opponent, Gov. Glick, did not have so large a vote as had been recorded against prohibition. A prohibition Legislature was elected, which refused to submit the anti-prohibition amendment offered. The defeat of Gov. St. John was everywhere accounted the defeat of the principle he had advocated, and open organization went forward to nullify the law. In all the larger cities and towns it was for two years overridden, though partially successful through the State at large. But in the autumn of 1883 those officials who had favored the defiance of law were deposed, prosecutions against violators were pressed with unusual rigor, and both open and secret rebellion against the Constitution and laws of the State almost entirely ceased. This new impulse began with a monster temperance convention at Topeka, Jan. 9, 1883, where 1,241 delegates assembled, and was continued through the efforts of the Kansas State Temperance Union. At the election the next autumn the enforcement of prohibitory law was made an issue in three fourths of the counties of the State, and in nearly all of these sheriffs were chosen duly pledged to perform their entire duty. In Topeka, the capital city, was made the most bitter fight of the liquor interest. The city was proceeded against, and a decision of the Supreme Court said that the city could not derive a revenue from the saloons. A case being made against the mayor, the same court decided that the State must proceed against him by criminal information in the court below. He resigned on plea of

ill health, a prohibitionist was elected by 492 majority, and all the saloons were closed.

Iowa's Legislature finally submitted an amendment to popular vote, June 27, 1882, it having been proposed and approved by the Legislature previous. There was a prohibitory law on the statute-books of that State, but its "wine and beer" clause gave practical exemption to the entire traffic in spirituous liquors. On its face, however, the prohibitory amendment had sole reference to wine and beer; and about 83 per cent. of the voters in Iowa were foreign-born. The contest here was carried forward chiefly by the Woman's Christian Temperance Union, which perfected an organization in every county, made a thorough canvass of the State, introduced a constitutional catechism among the children, and in four months accomplished an educational work as effective in its influences as it was surprising in its extent. The ablest temperance speakers were on the platform, in the pulpit, and on street corners, night and day. The literature of prohibition was scattered broadcast, but with unusual discrimination. The total vote was 281,118, and prohibition won by a majority of 29,759. A test case being made up against it, the amendment was declared unconstitutional by the Supreme Court, on the ground of a clerical error in the records of the Legislature, by which it was originally passed. (See Iowa, page 445.) Thus nullified in its constitutional embodiment, the principle was taken by those who supported it directly into the political canvass of 1888, the Republican party approving and the Democratic opposing, and was made the leading issue. "A school-house on every hill-top, and no saloon in the valleys," became the Republican rallying-cry, and again prohibition won. A bill rescinding the "wine and beer" exemption of the existing prohibitory law was promptly passed.

Ohio followed in the work for constitutional prohibition. After passing the Scott high-tax law, the Legislature of that State in 1888 adopted two forms of amendment, or two amendments, one for prohibition, the other for license. Under the Constitution as it stood, no license laws could be enacted, but there might be, or there was, free trade in liquors, except as covered by a tax, while there might also be prohibitory enactments if the Legislature so desired. Both amendments were submitted at the regular election ensuing, October 5th. They were confusing in their antagonistic provisions, and the temperance people appeared for a short time in doubt as to what position should be assumed. Then they organized for the second, or prohibitory amendment, and in opposition to the first. Here, as in Iowa, the Woman's Christian Temperance Union led the campaign; but a Constitutional Amendment Association, composed mainly of voters, helped to bear its burdens. Of necessity the question became more or less mixed up with the party struggle then in progress. The Democratic

party had declared for license, but was chiefly antagonizing the high-tax law; the Republican party openly supported the Scott law, and gave no help to prohibition. Yet for the third time in thirty-three years the people of Ohio, through a majority of those voting upon it, declared themselves against license and in favor of prohibition; but the prohibitory amendment was lost. It received, as counted and returned, 328,188 votes, out of a total of 721,810 cast for the several State tickets, and a majority of this total was required for its passage. The license amendment had less than 100,000, and besides these only about 100,000 voted against the second amendment. Of the 88 counties in the State, 88 gave an aggregate majority for prohibition of 4,815, and 46 of these gave individual majorities.

In Indiana a prohibitory amendment passed the Legislature of 1882, but was defeated in the Senate of 1883, because of an alleged error in the legislative record. In Connecticut such an amendment passed the House in 1882 by 140 to 20, but was beaten in 1883 by 115 to 83. In Pennsylvania, in 1881, it passed the House by 109 to 59, but failed in the Senate; in 1883, being reintroduced, it was amended in committee by a compensation clause, for the benefit of all persons whose property-rights the amendment might impair, and was killed by a vote of 151 to 27. Wisconsin lost the amendment bill in 1881, by lack of the necessary two thirds, though the vote stood 51 for to 89 against in the House; in 1883 the House vote was against it. New Jersey's upper House adopted the amendment in 1883, by 11 to 10, but the lower House defeated it by 29 to 27. Michigan, in 1881, gave, in the House, 63 for, 33 against; in the Senate, 21 for, to 10 against; but in 1883 there was not the necessary two thirds in favor. Maine legislatively adopted the amendment last winter by 91 to 30, and 22 to 2, in the two houses; it is now (1884) before the people. Massachusetts defeated it by 115 to 83; New York (1883), by 54 to 42, and 18 to 13; Nebraska (1882), by lack of two thirds; Illinois (1882), by 21 to 16 in the Senate, 66 for to 51 against in the House; Missouri (1883), by 68 to 59; West Virginia, by lack of two thirds; Texas gave it a majority of both houses in 1881, but lost it the next year; the Arkansas House gave it 66 to 17 in 1881, but the Senate did not concur; Minnesota lost it by 49 to 38; and Oregon passed it in 1888 by 52 to 6 in the House and 18 to 10 in the Senate, thus remitting it to another Legislature. Prohibition by constitutional amendment is now the settled policy of temperance-workers in nearly all the States.

Local Option.—Local prohibition by local option exists in sixteen of the thirty-five towns in Rhode Island; in about half the towns of Connecticut; in portions of five counties in New Jersey and in one entire, as also in two or three large towns; in fourteen out of twenty-three counties of Maryland, where vigorous

local-option campaigns have been carried on; in large areas of Alabama and Mississippi; in about half of West Virginia; in many counties of Texas, of North Carolina and South Carolina; in forty-two counties of Georgia; and in several counties of Missouri, Illinois, and Kentucky. Tennessee has local prohibition very largely through her four-mile law, which forbids the sale of liquor within four miles of a chartered institution of learning, outside of incorporated towns, and about one hundred towns have surrendered their charters, so as to come under the operation of the law. Arkansas has a similar three-mile limitation, applied by a majority of the people, women also voting. Potter county, Pa., has had prohibition many years by special law. The towns of Vineland, N. J.; Greeley, Col.; Pullman, Ill.; Bavaria, Ill.; St. Johnsbury, Vt.; and Millville, N. J., have absolute prohibition, the first three by provision in title-deeds. The entire Indian Territory has it by authority of the United States Government (declared in 1884, in a law "for the protection of the Indian tribes"), and the Cherokee nation also by their own constitution and laws.

High License.—High-license laws, considered prohibitory in effect, prevail in several of the States. In Arkansas, besides the three-mile limitation, which refers to a church as well as a school-house, the State fee is \$300, and most counties require from \$300 to \$500 additional. In Missouri the lowest fee is \$550, and this may be indefinitely increased by any town. Illinois has a fee of \$150 for ale and beer, and \$500 for distilled liquors, and every city, county, town, or village may prohibit the sale of intoxicants entirely, by majority vote. Michigan levies \$200 tax on each wholesale and retail dealer in malt-liquors, and \$500 on each wholesale dealer in spirituous liquors. In Nebraska the fee is \$1,000, and every man wanting license must have the approbation of thirty freeholders, his petition must be published two weeks in the newspaper of largest local circulation, and if any objection be made to him he is debarred; he must also give \$5,000 bonds, and must support all paupers, widows, and orphans, and pay the expense of all prosecutions, civil and criminal, which may be justly attributable to the traffic. Minnesota has a law quite similar. Sunday prohibition exists by statute in every State where restrictive laws have been enacted, but in all the large cities of all the license States it is but spasmodically enforced, as a rule, though generally observed by dealers in the smaller towns.

Effects of Enforcement.—As to the general enforcement of prohibition law, opinions differ. Maine, where it has been longest in operation, is usually cited to prove its failure or success. From the State and Government records these figures are gleaned: There are no distilleries or breweries in Maine. In 1888 the United States tax of \$25 was paid by 813 persons in the State, including nearly 200 druggists, and

because of the vigilant Government-detective service it was believed that this number represented all who were in any manner engaged in the traffic. All these were secret dealers, save the druggists and the dealers in seventeen cities and large towns. Counting the druggists as dealers, there was one dealer to about 800 inhabitants; in New York there is one to every 180, and the average number in the Northern license States is one to 210. The internal revenue collected in 1882, on the manufacture and sale of liquors, was four cents and three mills *per capita*; throughout the entire Union it averaged \$1.71 *per capita*. There were 156 dealers in Portland in 1888, most of them secret. In the 14 cities, with a population of 177,863, there were 496 persons, including druggists, who paid United States tax, or one to 300 inhabitants. In 60 license cities of other States there was one dealer to 155 inhabitants. In 470 towns and plantations in the State there were but 220 dealers, or one to about every 2,000 inhabitants. In 355 towns and plantations not a single dealer was found. In two cities and fifteen towns the law is not enforced, and these reported 179 dealers; while in 12 cities and 142 towns, where the law is enforced, 478 secret or suspected places were reported, making in these places, all told, one dealer to over 1,000 inhabitants. Actual arrests in 60 licensed cities show an average number of 27 to every thousand population; in the fourteen cities of Maine, during the municipal year ending in 1888, the average number was 17 to every 1,000; in all the cities, except Bangor and Portland, it was 10 per thousand; and in Lewiston and Auburn it was but three. The State at large has one high criminal to every 1,600 inhabitants; New York, one to 690.

A multitude of senators, governors, judges, and other officials have testified that the law is a success, despite its confessed non-enforcement in certain places. Said Judge Davis, "The Maine law even now is enforced far more than the license laws ever were." In a letter written in 1882, Hon. James G. Blaine said: "Intemperance has steadily decreased in this State, since the first enactment of the prohibitory law, until now it can be said with truth that there is no equal number of people in the Anglo-Saxon world, among whom so small an amount of intoxicating liquor is consumed as among the 650,000 inhabitants of Maine." Perhaps the most impartial testimony given was furnished in 1881, by two special reporters sent by the "Toronto Globe." One of these was a prohibitionist and the other was opposed to prohibition. The latter found that "in the cities the law has been a partial failure, so far as uprooting the traffic or even the suppression of open bars is concerned; that this failure has been greatly exaggerated by quoting exceptional places or periods as typical of the whole State, and by the ingenious perversion of statistics; that in the rural

portions of the State, the Maine law has suppressed open drinking, and reduced secret drinking to a minimum, and may, therefore, be considered as effective as any other measure on the statute-book; that the class of liquor-sellers who defy the law are the same class of men who, under a license system, would sell liquor without license."

Constitutionality.—The constitutionality of prohibition has been repeatedly considered by the courts. In January, 1847, the cases of *Thurlow vs. Massachusetts*, *Fletcher vs. Rhode Island*, and *Pierce vs. New Hampshire* came up for hearing before the United States Supreme bench. In these cases license had been denied, and the decision covered two points—the extent to which licenses might be conceded, and the right to prohibit unlicensed sale. Chief-Justice Taney, in delivering judgment, said: "Although a State is bound to receive and permit the sale, by the importer, of any article of merchandise which Congress authorizes to be imported, it is not bound to furnish a market for it, nor to abstain from the passage of any law which it may deem necessary or advisable to guard the health or morals of its citizens, although such law may discourage importation, or diminish the profits of the importer, or lessen the revenue of the Government. And if any State deem the retail and internal traffic in ardent spirits injurious to citizens, and calculated to produce idleness, vice, or debauchery, I see nothing in the Constitution of the United States to prevent it from regulating and restraining the traffic, or from prohibiting it altogether if it thinks proper." Justice McLean concurred, saying that "in the exercise of that great and comprehensive police power which lies at the foundation of its prosperity" the State may "prohibit the sale," and "everything prejudicial to the health or morals of a city may be removed." Justice Grier said, "Police laws for the prevention of crime and protection of public welfare must of necessity have full and free operation, according to the exigency that requires their interference." Said Justice Catron, also concurring, "I admit, as inevitable, that if the State has the power of restraint by license to any extent, she has the discretionary power to judge of its limit, and may go the length of prohibiting it altogether."

The State courts which have declared unconstitutional the prohibitory laws passed on by them, have done so, without exception, on some technical ground and not as regards the principle. In Kansas a plea was made that the amendment contravened the fourteenth amendment to the Constitution of the United States, which provided that no State should pass any law which would abridge the privileges and immunities of citizens of the United States; but the Supreme Court decided otherwise.

In Foreign Countries.—In Great Britain, prohibition has made considerable progress. Sales without license are punishable by fine or im-

prisonment; and all licensed places, in the metropolitan district of England, must be closed from midnight on Saturday until 1 p. m. Sunday, and from 3 till 6 that afternoon, then from 11 at night until 5 a. m. Monday.

Ireland has a similar Sunday-closing law, which first took effect in 1878, save in the cities of Dublin, Cork, Waterford, Belfast, and Limerick; yet, notwithstanding these are great centers of population, the law reduced by \$15,000,000 per annum, for four years, the consumption of beer and spirits; and, contrasting 1877 with 1882, there was a diminution in the arrests for drunkenness, throughout Ireland, of over 20,000.

In the Dominion of Canada, under the act of 1878, every county or city may petition the Secretary of State, and have a vote of the electors taken as to whether the liquor-traffic shall be prohibited or not, and if the majority favors prohibition it must stand until that vote has been repealed. In Ontario all licensed places must be closed from 7 p. m. Saturday till 6 a. m. Monday; and the council of any municipality may pass a local prohibitory by-law, or thirty electors may propose such a by-law, and demand a poll to determine its adoption.

Sweden started a temperance movement in 1835, which resulted in the Gothenburg plan of license, in 1858, whereby every individual is prohibited from deriving any private gain from the sale of spirits, or having any interest in extending their consumption. Licenses are sold by auction to a company organized for the purpose, which pays over the profits of all sales to the town or provincial treasuries to apply in reduction of taxes. In ten years, it is claimed, this system reduced drunkenness 40 per cent. By a permissive bill, also in operation now in Sweden, the local authorities may prohibit the traffic altogether.

Russia has the Gothenburg plan for the nation at large, and limits the traffic to one dealer in each village, with privileges equally restricted; while any commune can enforce total prohibition at pleasure.

Several towns and counties in Great Britain maintain prohibition. Saltaire has not had a drinking-place in many years. Bessbrook, Ireland, has 4,000 inhabitants, with no public-house, no pawn-shop, no police-station. In Tyrone county, Ireland, there are 61 square miles of land and 10,000 people, without a public-house or (in 1870) a policeman. In 1,456 parishes in the province of Canterbury, containing over 280,000 inhabitants, and in 80 in the province of York, no public-house or beer-shop is permitted. On numerous private estates prohibition prevails; and there are large areas in the new portions of Liverpool and London where, by title-deed provisions, the sale of liquor is forever prohibited. One of these tracts, in the south of Liverpool, is one and a half by two miles in extent, and has 50,000 people. The annual death-rate ranges there between 10 and 12 per 1,000, while Liverpool,

as a city, is reckoned as having the largest death-rate in the United Kingdom, ranging from 25 to 35 per 1,000 annually.

The Arguments. — Advocates of prohibition base their arguments on the greatest good of the greatest number; the duty of Government to conserve general welfare; the right of the State to exact obedience by the citizen; the known tendency of intoxicating liquors to produce immorality, vice, and crime; their certain source of taxation, and their enormous national waste. Human brotherhood, Christian sentiment, moral need, and progressive civilization, it is held, demand the suppression of a traffic which cares for none of these considerations, but debases manhood, debars Christianity, and defiles the State. With John Stuart Mill, prohibitionists believe that "to tax stimulants, for the sole purpose of making them more difficult to be obtained, is a measure differing only in degree from their entire prohibition"; and the claim of "personal liberty," as opposed to prohibitory law, they meet with a further declaration by Mr. Mill that "the liberty of one man ends, however profitable it may be to himself, when it interferes with the well-being of another."

PROTESTANT EPISCOPAL CHURCH IN THE UNITED STATES. This Church is in communion with the Church of England (whence it derives its origin), and with all the branches of the Anglican Church throughout the British Empire and elsewhere. Its position and growth in the United States are of more than ordinary interest at the present time, inasmuch as it counts just one hundred years of life, as a church existing of and by itself in the republic of the United States, and enjoying the privileges of our country's laws and regulations in regard to religious bodies of every description. The year 1883 is further noteworthy in Episcopal Church affairs, because of the earnest and zealous effort put forth and carried out to completion, in order to give greater flexibility in the use of the Book of Common Prayer, and greater enrichment and fullness to the public services of the Church. The sources of information from which this article is drawn are, the Journal of the General Convention of 1883, Pott's "Church Almanac," and Whittaker's "Protestant Episcopal Almanac." The following table presents a summary of statistics of Church progress from 1880 to 1883:

Number of dioceses.....	48
Number of missionary jurisdictions.....	15
Bishops.....	63
Candidates for orders.....	401
Deacons ordained.....	409
Priests ordained.....	859
Whole number of clergy.....	8,627
Number of parishes.....	2,749
Missions.....	1,807
Corner-stones laid.....	140
Churches consecrated.....	811
Number of churches and chapels.....	8,782
Free churches and chapels.....	1,837
Rectories.....	1,159
Families.....	123,961
Baptisms (infant and adult).....	184,080
Confirmations.....	75,560
Marriages.....	89,268

Burials.....	77,568
Communicants.....	864,125
Sunday-school teachers.....	33,900
Sunday-school scholars.....	814,910
Church hospitals.....	45
Church orphan asylums.....	48
Church homes.....	39
Academic and collegiate institutions.....	116
Theological and other institutions.....	72
Communion alms.....	\$515,485 64
Offerings for diocesan missions.....	\$593,672 83
Offerings for domestic missions.....	\$649,463 04
Offerings for foreign missions.....	\$357,778 46
Total of charitable offerings and income.....	\$9,487,430 04
Total offerings for religious purposes.....	\$28,912,731 63

PROGRESS BY DIOCESES.

The General Convention.—This body, which is the supreme legislature in the Episcopal Church, meets triennially in the place appointed from time to time. It assembled this year in Philadelphia, October 8d, and continued in session until October 26th, inclusive. There were about fifty bishops present, and also clerical and lay deputies from forty-eight dioceses and two missionary jurisdictions. The Convention consists of two houses, which hold sessions as distinct bodies, viz., the House of Bishops and the House of Clerical and Lay Deputies; but concurrent action (as in the case of the Senate and House of Representatives at Washington) is necessary to valid legislation. In addition to regular business requiring attention, such as action on proposed amendments to the Constitution and Canons, reports of standing and special committees, the state of the church, etc., the chief feature of interest to church people at large was the very full and able report, and its free and careful discussion, of the joint committee on the Book of Common Prayer, appointed three years ago. The entire proceedings are presented in the "Journal of the General Convention," as a supplemental journal.

Domestic and Foreign Missions.—The Board of Missions consists of the bishops of the Church, of the members of the House of Deputies and of the Board of Managers. It holds its sessions at the same time and place as the General Convention. The Board of Managers consists of the bishops, the treasurer of the board, and fifteen laymen appointed triennially. This board is charged with all the powers of the Board of Missions during the interval between the triennial meetings, and divides its work between a Domestic Committee and a Foreign Committee, with headquarters in New York.

Domestic Missions.—Sept. 1, 1882, to Sept. 1, 1883. Missionaries (13 missionary jurisdictions and 25 dioceses); bishops, 14; other clergymen (white, colored, Indian), 425; teachers, other helpers, etc., 45; total, 484. The financial condition was as follows:

Collections, legacies, etc.....	\$272,082 61
Expenditures (thirteen missionary jurisdictions and twenty-nine dioceses).....	165,326 16
Missions among Indians and colored.....	61,440 42
Office and other expenses.....	14,246 98
Cash in bank.....	81,069 10
Total.....	\$272,082 61

Foreign Missions.—Sept. 1, 1882, to Sept. 1, 1883. Missionary bishops, 3; other clergy

(white and native), 87; teachers, helpers, etc., 154; total, 194. The financial condition was as follows:

Collections, legacies, general fund.....	\$142,571 95
Specials, etc.....	14,368 55
Treasury overdrawn.....	3,711 84
Total.....	\$160,651 84

The Woman's Auxiliary to the Board of Missions renders efficient aid in the work of all the departments, by means of parochial, city, county, and diocesan associations of ladies, formed for the purpose of raising money, preparing and forwarding boxes, and otherwise helping on the missions of the church.

Money raised for domestic, foreign, freedmen, and Indian missions.....	\$47,627 75
Boxes for the same (1,540 in number), value.....	109,619 18
Total.....	\$157,246 88

The American Church Missionary Society (also auxiliary to the Board of Missions) has employed during the year, in 17 dioceses and missionary jurisdictions, 40 missionaries. The financial condition was as follows:

Receipts from parishes, etc.....	\$12,644 28
Receipts for foreign missions.....	261 08
Balance in hand Sept. 1, 1883.....	2,894 10
Total.....	\$15,799 41

Boxes of clothing sent to missionaries.....	28
Boxes of clothing, value.....	\$3,988 88
The society has also in legacies, securities, etc., over.....	\$81,000 00

The Mexican League, in aid of church work in Mexico, reports that during the past three years (Sept. 1, 1880, to Sept. 1, 1883) it has contributed, in both general and special, through the Foreign Committee, \$54,968.89. The interest in this work is much abated, owing to various charges and ill rumors in regard to Bishop Riley's doings, as well as a general "muddle" in Mexican church affairs. The whole subject was brought up at the meeting of the Board of Missions in October, but no satisfactory result was reached.

The American Church Building Fund Commission, established in 1880, is doing a good work. The object proposed was to create a fund of \$1,000,000 to aid in building new churches in any diocese or missionary jurisdiction, and, if possible, to gather this sum within three years. Although the commission has not been able to accomplish that grand result, it has gotten well under way, and looks forward with confidence as to ultimate success.

A large number of applications for loans and gifts was received, and to the extent of ability help was granted. The treasurer reports (from Jan. 1, 1881, to Sept. 1, 1883) that loans were made to eight churches, amounting to \$8,400, and gifts amounting to \$415.20. Receipts during the same period, \$50,471.77.

The Society for promoting Christianity among the Jews (auxiliary to the Board of Missions) reports steady though not rapid progress. During the year eight new missionaries were appointed, and three new missionary schools and five new industrial schools were established. Three new mission-houses have been secured. Aid has been given to the parish clergy of towns and villages in local work among the Jews, through thirty-six dioceses and ten missionary jurisdictions. Total number of workers has been 223, the Jews being reached in 202 cities and towns.

Receipts, etc. (from April 1, 1882, to Sept. 1, 1883)	\$29,909 90
Expenditures for schools, salaries, etc.	27,280 67
Balance to new account	2,628 58

Total \$29,909 90

General Condition of Church Affairs.—During the year 1883 two bishops have died, viz., Bishops Talbot and Pinkney (see *OBITUARIES, AMERICAN*), also sixty others of the clergy. Five of the clergy have been raised to the Episcopate, viz., H. M. Thompson, Assistant Bishop of Mississippi; D. B. Knickerbacker, Bishop of Indiana; H. C. Potter, Assistant Bishop of New York; A. M. Randolph, Assistant Bishop of Virginia; and W. D. Walker, Missionary Bishop for Northern Dakota. The Committee of the General Convention on the State of the Church note the great deficiency in numbers of candidates for orders, and attribute this deficiency to various causes, such as the length of time required and the great expense incurred in securing proper education for the ministry; the frequent parochial changes; and the lack of provision for old age and infirmity.

The Church Temperance Society is spoken of in high terms, and earnest hope is expressed that it may be an efficient helper in "checking the ravages of that sin which, while not so general in America as in some localities abroad, has, it can be averred without extravagance of speech, consigned more to premature graves than war, pestilence, and famine combined."

As illustrating the present spirit of the Church, the committee's report calls attention to the fact that "cathedrals, church schools and colleges, hospitals and homes, have grown apace in number and efficiency. Dioceses have been subdivided into districts for more effective missionary work in their own borders, bringing clergy and laity of common centers into more frequent counsel as fellow-helpers. Deaconesses and sisterhoods have been multiplied, to do what only holy women with a distinctive dress and under diocesan direction can do. Guilds, in many leading parishes, have set all their membership to active parochial work. Church music has made progress; so that what

was ostentatious and unseemly in the house of God has given place to that which is classical, dignified, and churchly. And whereas, only forty years ago, there was but a single parish in all the land which had the Eucharist weekly, there are now some three hundred parishes where it is celebrated as the central act of divine worship, at least on every Lord's day. The enriched Book of Common Prayer, with the new Lectionary, is hailed with general delight, as not the least among the increased instrumentalities for pulling down the strongholds of sin, Satan, and death, and as commending our branch of the kingdom of our blessed Lord as pre-eminently adapted to the composite character of the American people."

PURCELL, John Baptist, a Roman Catholic prelate in the United States, born in Mallow, Ireland, Feb. 26, 1800; died in the Ursuline Convent at St. Martin's, Ohio, July 4, 1883. He received a fair education, and in his eighteenth year came to America. On examination by the faculty of Asbury College, Baltimore, he was granted a certificate, and he soon after obtained a place as private teacher in a family in Queen Anne county. In June, 1820, he entered Mount St. Mary's College at Emmittsburg, Md., and prosecuted his studies there for three years.

In the autumn of 1823 he received from Archbishop Marechal, of Baltimore, the four minor orders of the Roman Catholic Church. Early in 1824 Mr. Purcell sailed for France, to complete his studies in the seminary of St. Sulpice, at Paris and Issy. He was raised to the priesthood, in Notre Dame Church, with three hundred others, on May 21, 1826. On his return to the United States, the next year, he was appointed Professor of Moral Philosophy in Mount St. Mary's College. He also aided Dr. Bruté in teaching theology, and at the same time attended to the regular duties of priest in the neighboring congregation. In 1829 he became president of the college, which office he held for four years.

Father Purcell had been a priest for little more than seven years, when, by pontifical bull, in May, 1833, he was appointed Bishop of Cincinnati. He was consecrated to this office in Baltimore Cathedral, October 13th, and installed in the Cathedral Church in Cincinnati, Nov. 14, 1833. At this date there was only one church of his denomination in Cincinnati, and his diocese covered the whole State of Ohio. His labors, consequently, were arduous and incessant. He obtained relief as to episcopal work proper by having Cleveland diocese set off in 1847, and the diocese of Columbus in 1868. He was very active and industrious in founding churches in nearly every considerable town in the State, as well as in establishing an ecclesiastical seminary, orphan asylums, protectories, colleges, gymnasiums, convents, houses of education and religious houses, hospitals and free schools, and various religious orders. In Cincinnati and its

immediate suburbs there are now over thirty Roman Catholic churches.

In 1839 Bishop Purcell was made assistant prelate at the pontifical throne, and in 1850 he was promoted to the archbishopric of the province of Cincinnati. Being in Rome, in 1851, he received the pallium from the Pope's own hands. The Vatican Council was held in 1869-'70, and Archbishop Purcell was one of the American prelates who were present and took part in its discussions and proceedings. On the special point of the defining of the Pope's infallibility and making it an article of faith, he was constrained to record his vote against it. On two occasions the archbishop showed himself to be a very able debater and an effective public speaker. The one was in 1837, when he held a discussion for seven days with Alexander Campbell, founder of the sect of Disciples, or Campbellite Baptists. The discussion was published and widely circulated. The other occasion was later, when, at the age of threescore and ten, he encountered an infidel orator, named Vickers, and defended Christianity. This discussion also was published under the title, "The Roman Clergy and Free Thought" (1870). Other publications of Archbishop Purcell's were Lectures and Pastoral Letters; an introduction to the American edition of Kenelm H. Digby's "Mores Catholici, or Ages of Faith" (8 vols., 1847); Diocesan Statutes, Acts, and Decrees of Three Provincial Councils held in Cincinnati; and a series of school-books for use in Roman Catholic schools in his diocese.

The latter years of this prelate were much disturbed by financial difficulties. Like some other Catholic bishops and priests in America, Archbishop Purcell permitted his brother, the vicar-general, to receive money on deposit, at interest. Through bad management and carelessness, though with no purpose of dishonesty or fraud, his diocese was found to be a loser to the amount of \$3,500,000. In December, 1878, the archbishop assumed the whole responsibility for these transactions and made a public statement, saying that he was very deeply in debt, and unable to meet the demands upon him. A large number of suits was brought against him, and he made an assignment of all his property, real and personal, to his brother, the Rev. Edward Purcell, who in turn assigned the property to John B. Mannix, an attorney, for the benefit of the creditors. The property assigned included the archbishop's residence, the old St. John's Hospital building, the cathedral school, and some land on the outskirts of the city. Most of the accounts with the depositors, it was found, had been kept on loose bits of paper, many of which were lost, and some, having been made over

thirty years ago, were almost illegible from age. In the eight years 1871-'78 he had paid about \$580,000 in interest, and before the beginning of that period he is supposed to have paid in the same way \$1,500,000.

The former assignment having been unsatisfactory to some of the creditors, Archbishop Purcell made a personal assignment of his property, March 13, 1879. Three days later the trustees appointed to take charge of the property made their report. They found that there were 3,485 creditors, presenting claims to the amount of \$3,672,371.57. Besides this, the Very Rev. Edward Purcell individually owed \$117,000 and \$85,000, the latter being secured by a mortgage on real estate. They were at a loss, they said, to ascertain the disposition of all this property. They saw no reason to suspect dishonesty or intentional fraud, but they thought that bad investments, shrinkages, misplaced confidence, and unbusiness-like management had caused the trouble. The archbishop thereupon published a letter, saying that the indebtedness of the diocese did not exceed \$1,000,000 in equity. A large part of the debt, he affirmed, was accumulated through paying interest. For twenty years, he further declared, he had supported the Diocesan Seminary without taking a collection. He had bought a church library of 16,000 volumes, and had brought many priests from Europe. His brother Edward, he said, had never put a dollar of the church money to his own use. He freely acknowledged that he was honestly indebted to his 3,000 creditors, and thanked the people for their offers of assistance. Up to October, 1879, the amount collected toward defraying this vast debt was not more than \$75,800—not enough, in fact, to pay the interest since the assignment. Early in 1883 the debt still amounted to \$3,500,000. The litigation growing out of the receiving of moneys on deposit by Very Rev. Edward Purcell, vicar-general and brother of the archbishop, was at last decided by the court, which gave the case a long and patient hearing. The archbishop, having on his brother's insolvency, assumed his liabilities, the question arose, what property became liable by this assumption of the debt. The creditors claimed everything that stood in his name. The court (Smith, Justice) held that property acquired and improved by him as bishop, with means acquired by him in that capacity, was liable for such a debt; but that churches, schools, etc., erected by congregations from their own means, were not liable, although by a rule of the Church the legal title of the realty was in such bishop, and that such congregations were liable to the creditors only to the extent of loans or advances made to them by the bishop.

Q

QUEBEC, a province of the Dominion of Canada. Area, 188,000 square miles; population in 1881, 1,359,027.

The People.—The inhabitants are chiefly French Roman Catholics, though many English and Scotch Protestants occupy the counties east of the St. Lawrence along the United States border. These are termed "The Eastern Townships," and are much in advance of the districts farmed by the French. Many of the French inhabitants are descendants of Scottish soldiers, who, seeking service in the armies of France before and during the reigns of William III and Anne in England, were disbanded and settled in the province. Such names as De Ramsay, De Murray, D'Alexandre, and De Napier, are still common among the French of these districts. The prevailing language is French, though in Quebec and in Montreal both tongues are familiar to the people.

The original tenures, or large farms, which, as a rule, were located along the rivers, have been divided and subdivided for generations, each subdivision still retaining a frontage on the river or highway, until now it is not uncommon to see a farm only a few rods wide and over a mile long. As the French Canadian builds his cottage in the most picturesque spot along the river-bank, the scene presented is in many instances very animating, closely resembling one long, straggling village. In some of the more remote localities the parish priest is still the shepherd of the flock in more than spiritual matters. He directs their voting at elections, controls their conduct at fairs and on market-days, and even has the grain garnered in his barns. Tithes, in Quebec Province, or any rates levied by the authority of the Roman Catholic Church on the property of Roman Catholics, no matter whether leased by a Protestant or not, are collectable by law.

Soil and Climate.—On the whole, the soil of Quebec is not good. The Eastern Townships, and some districts north of the St. Lawrence and along the Ottawa, are good, especially for grazing; but as a grain-growing province it is not a success, compared with Ontario.

The cold currents from the Arctic regions, entering the Gulf of St. Lawrence through the strait of Belle Isle, preserve a continuous frigid temperature along the northern shore of the gulf. This influences the climate of the surrounding country to a considerable extent. A scheme is proposed to bridge or embank the strait of Belle Isle from Newfoundland to the mainland, and thus force the cold currents along the east coast of that island. By this plan, it is also claimed, winter navigation of the St. Lawrence gulf and river, as far as Quebec, would be rendered comparatively easy. At Quebec, in latitude $46^{\circ} 49'$, longitude $71^{\circ} 16'$, the mean annual temperature rarely exceeds

38° . It is not alone the general temperature that renders the northern and northeastern portions of the province comparatively worthless, but also the certainty of early and late frosts destroying the crops. The maximum summer heat is as great as Toronto's. The means for June, July, August, and September, respectively, are 58° , 68° , 61° , 55° .

Cities and Ports.—The important cities and towns of Quebec, with their population in round numbers, are: Montreal, 140,000; Quebec, 62,000; Three Rivers, 9,000; Levis, 8,000; Sherbrooke, 8,000; Hull, 8,000; St. Henri, 6,000; St. Jean Baptiste, 6,000; Sorel, 6,000; St. Hyacinthe, 5,000.

The ports are Quebec, Montreal, Three Rivers, Sorel, and Rimouski, all on the St. Lawrence, and accessible for ocean-vessels of all sizes. Gaspé and New Carlisle are on the shores of the St. Lawrence and Chaleur gulfs. The great bulk of the trade of the province is carried on from Montreal and Quebec.

Industries.—In Quebec, as in Ontario, the chief industry is farming. Unlike Ontario, the grazing products in Quebec are in excess of the agricultural; the exports of animals and their produce in 1882 being \$10,694,531, and of agricultural products only \$9,551,745. Of the former, \$8,875,818 were shipped to Great Britain, and \$1,728,602 to the United States; and of the latter, \$6,445,440 went to British ports, and \$2,021,847 to American. Peas, wheat, flour, oats, hay, rye, and potatoes are the chief agricultural products.

The products of the forest rank next in importance, the exports amounting to \$9,280,238. Of this, \$7,184,286 went to Great Britain, and \$1,409,824 to the United States.

The exported manufactures amounted only to \$1,247,147. These were chiefly leather, woollens, wooden-ware, ships, and soap. To Great Britain were sent \$705,330; to the United States, \$369,306; and to Newfoundland, \$108,008.

The export value of the fisheries of Quebec was \$778,785; but there is a large home consumption of Quebec fish. Indeed, very many residents along the lower part of the river and the gulf earn their livelihood in this manner, depending almost entirely on fish for food.

Mining is in its infancy in Quebec. The exports were valued at \$519,200, chiefly gold-bearing quartz, copper-ore, and phosphates.

Education.—The educational department of Quebec is presided over by a superintendent, who is the executive officer of a Council of Public Instruction. This council is appointed by the Lieutenant-Governor, and is composed of sixteen Roman Catholics and eight Protestants. In all matters specially affecting their own schools, the Roman Catholic and Protestant commissioners act independently. Each municipality

selects a board of five commissioners, who appoint the teachers and have a general oversight. The schools are open to children from five to sixteen years of age, but the commissioners have power to charge a fee, if they deem it proper, between the ages of seven and fourteen. The estates of the Jesuits form a fund, which must be increased each year by a sufficient grant from public moneys to raise the amount to \$88,000. The annual grant amounts to \$155,394, and the total sum raised for educational purposes is \$2,000,000. The value of the buildings used for superior education in the province, and the annual expenditure in connection with them, are :

INSTITUTIONS.	Value of buildings.	Annual expenditures.
Universities	\$588,880	\$104,978
Classical colleges.....	918,929	256,111
Industrial colleges.....	201,292	45,145
Academies for boys.....	287,889	74,144
Academies for girls.....	914,185	208,178
Model schools.....	684,809	809,848
Normal schools.....	42,871

There are in the libraries of the institutions for superior education 259,318 volumes.

There are in the province 1,010 school municipalities and 4,039 school-houses, with a registered attendance of 238,574 pupils, and an average attendance of 180,370.

R

RAILWAYS, ELECTRIC. So long as we were confined to the direct generation of electric currents from chemical action in a battery, any attempt to utilize electricity in industrial operations involving large power would have been hopeless. But the development of the mechanical generation of electricity has rendered feasible the use of this agent as a motive power in a great variety of cases.

By means of the modern dynamo we can convert mechanical into electric energy upon the largest scale, and by reversing the process we can obtain from this electrical energy mechanical power. The dynamo supplies us with electric currents if we rotate its armature, or this will revolve if we pass electric currents into it. Since the generating dynamo may be at one place, and the motor which is operated by the currents supplied by it at another, we are not limited to using the power at or very near its place of production. As the distance between the two may be very considerable, and the loss in conveyance small, this arrangement gives us a means of transmitting and utilizing power not heretofore possessed, and one which can hardly fail of being of the utmost industrial importance. Among the applications of electricity as a motive power none promises to be more important than its use in the propulsion of railway-cars. Aside from the advantages due to the absence of smoke and cinders, this mode of propulsion possesses distinct advantages on the score of economy and greater safety. With the present system of railway-travel a number of cars linked together are drawn by a locomotive which must be heavy to obtain sufficient adhesion to the rails to move its load. In consequence of this great weight of the motor, the whole equipment of the road—rails, road-bed, bridges etc.—must be of great strength. In the case of electric propulsion it is not necessary to have anything corresponding to a locomotive; each car can be provided with its own electro-motor, and all of these can be operated together from a cab at the head of the train with the same ease with which continuous brakes are

now manipulated. All the wheels of a train can thus be utilized as drivers, and hence great weight is not necessary to give sufficient adhesion. The permanent way can therefore be much lighter, and consequently less costly, while the wear and tear would be greatly reduced. On account of the diminished weight of trains a collision would be a much less serious matter than at present. We may not only obtain with the electric railway lessened damage in case of collision, but we can by a proper construction, as we shall see further on, render collision impossible.

Electricity may be applied to the propulsion of cars in two quite different ways. In one case the current is supplied to the electro-motors from storage-batteries carried by the cars. This method requires no change in the ordinary road-bed, and would not necessarily introduce new methods of operating railways. It is particularly well adapted to the operation of cars in the streets of cities, but its adoption is hardly feasible to-day, as the storage-battery upon which it depends has not yet reached a sufficiently perfect condition to make it economical. In the second case the current is supplied to the motors on moving trains from stations along the line of the road through properly placed conductors. This method requires a construction of the road throughout with reference to the electrical conditions which properly constitute it an electric railway. Several different forms of the electrical railway are possible, depending upon the method by which the current is conducted to the motors. By one method the two rails are used as conductors, the current going out by one rail and returning by the other. It passes to the electro-motors through the wheels of the train, those on opposite sides being insulated from each other. The chief difficulty with this construction is that of insulating the outgoing rail perfectly enough to avoid a large loss by leakage. It is impracticable in cities, on account of the danger arising from touching both rails at once, and thereby diverting a portion of the current through the person or

animal forming a cross-circuit to the conductors. As, for the economical working of an electric railway, currents of high tension are necessary, this danger would be too great in such situations to tolerate such a disposition of the conductors. In the ordinary railway this feature would be of little consequence, as the track is not exposed to the public except at the crossing of roads, and this can be readily provided for. The leakage would be, however, in this case prohibitory of the use of these rails in this way. Professors Ayrton and Perry have modified the two-rail system in such a way as to overcome the difficulty from leakage, as we shall see below in considering their construction. Other inventors have essayed to overcome it by the use of a third rail or conductor for the outgoing current, utilizing both rails for its return. This conductor may be placed midway between the rails, but elevated above them, as used by Siemens, or sunk in a central trough, as in the Edison and Field system, or it may be placed on posts at one side of the rails, the connection then being made between it and the car by a flexible conductor. The contact between this latter and the suspended wire is made by means of a little traveling carriage or trolley. This method of receiving the current would evidently not do for rapidly moving trains, though perfectly feasible for street and suburban railways.

Where high speeds are required, the third rail must be placed so that there may be rigid connection between it and the moving car, the current then being taken off by means of a rolling or other suitable metallic contact.

Siemens Railway.—The first electric railway was constructed by the firm of Siemens and Halske, of Berlin, at the exhibition in that city in 1879. The line was of two-foot gauge and 2,700 feet long. The current was conveyed to the car, which was of sufficient size to carry twenty passengers, by a third rail placed in the center of the track and supported upon insulating wooden blocks. The great success of this experimental line led these constructors to build soon afterward the Lichtenfelde line, near Berlin, for actual traffic. This was constructed on the two-rail system, both rails being placed upon insulating sleepers. The gauge is three feet and the length about a mile and a half. It is worked by two dynamo-machines developing a total of 12 horse-power, and has been in operation since May, 1881. Another line of about the same length has also been built between Charlottenburg and Spandauer Bock, while a shorter one has been constructed in Kostverloren Park, near Amsterdam. A short line, something less than half a mile in length, has also been put in operation by the same firm at the Zankerode colliery in Saxony. The rails are not used in this

FIG. 1.—SIEMENS AND HALSKE'S ELECTRIC ENGINE.

case for the conduction of the current, as they are very roughly laid, and have to be shifted from time to time. The electric conductors are therefore placed along the roof of the mine. They consist of inverted T-iron rails, on which contact-carriages freely slide. These are connected with the motor by flexible wires. The engine, shown in Fig. 1, consists of a carriage eight feet long by two feet seven inches wide, which weighs one and one third tons. The electro-motor is placed on it lengthwise, the connection between it and the wheels being made through the medium of bevel-gearing. It is reversible, and handles for making and breaking the current, and the brake levers, are placed at each end, so that the driver always faces in the direction in which the engine is moving. The engine is capable of developing sufficient power to enable it to draw a load of eight tons at a rate of seven and a half miles an hour. This road has been in operation since October, 1882, and has fully realized the anticipation of the constructors and the owners of the mines. At the Paris Exposition of 1881, Sir William Siemens had in operation a road about 1,600 feet in length, and of the ordinary gauge, 4 feet 8½ inches. In this case the electric conductors were suspended overhead, and consisted of tubes provided with longitudinal slits, for the passage of flexible conductors, which were connected with metallic bolts sliding in the tubes. Fully 95,000 passengers were conveyed over this line in seven weeks. The longest electric railway which has yet been built is that constructed by the London firm of Siemens Brothers, in the north of Ireland, between Portrush and Bushmills, a distance of six miles. The line is a single-track one of three-foot gauge, and is laid at one side of the country road, following its grades, which are heavy, being in some parts as steep as 1 in 35, and curves which are often sharp. The system employed is the three-rail one, but the conductor, instead of being between the rails, is placed at the side of the road-bed, 22 inches from the inner rail, and 17 inches above the ground. It consists of a T-iron rail weighing 19 pounds to the yard, and is carried upon wooden posts boiled in pitch to render them better insulators. The current is taken by the car from the conductor by means of two steel springs, one at each end, and, as the rail is of iron, the wear is very slight. When the railway crosses roads, the conductor is carried underground. These gaps, when not too wide, are readily bridged over by the car, as the forward spring makes contact with the rail at the farther side of the cross-road before the rear spring leaves the rail. When the gap is too wide to allow this, the circuit is broken by the engineer, and the car is carried across it by its momentum. There are five points on the line at which the up and down cars pass each other. These are situated on inclines, and are arranged so that the car ascending the hill is in contact with the conductor, while the down car de-

scends by gravity. The course of the current from the conducting rail through the car to the return rails is to a switch worked by a lever, by which resistance-coils can be placed in or out of circuit, then through the electro-motor to the wheels by which it reaches the rails. The direction of motion of the electro-motor is reversed by altering the position of the brushes on the commutator. The motor is placed in the center of the car, beneath the floor, and is connected with the axle of one pair of wheels by gearing. The reversing and brake levers are placed at each end of the car, so that it can be operated from either end. The rails of the permanent way are laid in the usual manner, and connected together by fish-plates, these being supplemented by strips of copper to insure good electrical contact. The lengths of the conducting rail are also joined in this manner. The resistance of the line, conductor, and return rails, is but .28 ohm per mile. The loss due to resistance does not exceed 4 per cent. when four cars are running, each requiring four horse-power. The insulation is from 500 to 1,000 ohms per mile, and the loss from leakage is under 5 per cent. when four cars are running. It is intended to operate the generating dynamo by means of water-power, but at present an ordinary portable agricultural engine of 25 horse-power is used for this purpose. This is not particularly economical, but tests made have shown that even with it the road can be operated more economically than with a steam tramway-engine. The tests were for a travel of 812 miles, each train having the same passenger capacity. They showed that the cost of operating the road by means of the locomotive was something over £8 (\$40), and that by electricity a little less than £6 (\$30), giving a saving by the use of the latter of 25 per cent.

Edison and Field Railway.—Mr. Edison was one of the first to turn his attention to the electric railway. While still occupied in designing his system of incandescent electric lighting, he put in operation at Menlo Park an experimental line. On this the current was conveyed to the electro-motor through one rail, and returned by the other. The electro-motor was mounted upon a separate car, as in some of the Siemens roads. The use of the two-rail system was simply experimental, the design being in actual construction to use three rails, the conductor being placed between the two rails in a sunken trough. This is covered over, so as to leave only a narrow slit, through which the arm carrying the contact can move freely. In the early part of the year the interests of Mr. Edison were combined with those of Mr. Stephen D. Field, who has patented a number of features pertaining to an electric railway system, and the company controlling these combined interests exhibited their system at the Chicago Exhibition of Railway Appliances.

The track was laid in the gallery of the main exhibition building, and was of the form shown

in Fig. 2. The current was conveyed to the motor through a third rail placed between the two others, which was not, however, sunk, as it would have been in a permanent surface structure. The contact between this rail and the car was made by stiff wire brushes press-

FIG. 2.—EDISON AND FIELD'S RAILWAY.

ing on each side of the rail, which were on the end of a lever reaching down from the car.

The road was in operation from the 9th to the 23d of June, and made in this time 1,588 trips, and carried 26,805 passengers. The speed at which the trains were run was eight

miles an hour. This could easily be exceeded, but the insecurity of the gallery in which the track was laid prohibited anything above this.

Ayrton and Perry's Railway.—Realizing the difficulty of insulating the tread rails in a sufficiently perfect manner to prevent undue loss by leakage in long lines, and yet desiring to retain the advantages of the two-rail system, Professors Ayrton and Perry set themselves to work to modify the latter system so as to answer all the requirements. This they have accomplished in a remarkably simple manner, by the employment of an auxiliary conductor running along one of the rails, between which and the rail electric connection can be made automatically by the moving train. The road is thus divided electrically into sections, only those in the immediate neighborhood of the train at each moment, as it sweeps along, being in circuit. The whole of the tread-rail from which the current is taken by the wheels of the moving car is well insulated from the ground, and the successive sections into which it is divided are also insulated from each other. The auxiliary conductor is in the form of a cable, and can therefore be very perfectly insulated, as can also the connections by which it makes contact with the sections of the tread-rail. Any leakage that occurs can therefore take place only from these short sections, and will consequently be inconsiderable. Contact between the cable and the tread-rail may be made in a number of ways. One of these consists in providing a short length of rail, placed so as to be depressed by the wheels of the moving car, and resting upon a corrugated steel disk, which forms the top of the box containing the exposed contact of the cable. The flexibility of the disk allows a pin carried by it to make contact with a suitable conducting-piece permanently connected with the cable.

The box, which may be of cast-iron, is made tight, so that it is always dry within, where the exposed portion of the conductor is. This box may be bolted to a sleeper at the side of the rail or sunk in the ground, as occasion may require. The cable may be simply insulated with gutta-percha or rubber, or it may be carried in a metal tube filled with paraffine.

The insulation obtained by this mode of construction is but one of its advantages, and that not the most important. Its great advantage lies in the fact that it provides an automatic block system, which absolutely prevents a following train from running into the one ahead—a block that is determined by the conditions of operation, and is not depend-

ent upon the vigilance of engine-driver or signalman. To obtain this result the above-described arrangement is modified somewhat. The road is divided into a number of sections or blocks, a mile or more in length. By the movement of the train the current is put on the section

which it is entering and turned off from the one which it is leaving. The train thus always puts between itself and a following train a complete section, which can not be supplied with current until the forward train has entered the next section. Any following train entering this blocked section is quickly pulled up, both because it is deprived of current, and because it is powerfully braked by the electro-motor, which by the conditions of the block becomes at once a generator on a short circuit. In leaving this section the preceding train not only cuts off the supply of electricity to it in such a way that it can not be turned on again by any following train until the first is in the second section ahead, but it connects the two rails electrically together. There is therefore a complete metallic circuit, of practically no resistance, established between the terminals of the electro-motor of the following train when it runs on the blocked section. The motor, being in motion from the supply of current in the preceding section, is thus instantly converted into a dynamo working on a short circuit, and the current generated by it brings it to a stop. The great merit of this system of blocking is, that it depends upon the essential conditions of the working of the line, and not upon special mechanism, which may get out of order. So long as the line is in working order the sections will be successively blocked by the movement of a train, but when it is not in order trains can not move, and hence all danger of collision between following trains is absolutely prevented. Ayrton and Perry have also perfected, for use with their system, a motor which is automatically governed, so that the speed is constant whatever the load.

Telpherage.—The facility with which electric power can be divided and applied at any desired point, and the possibility it gives of controlling a line of moving vehicles from the point at which the current is generated instead of from the train, has led Prof. Fleeming Jenkin to design a system of aerial transportation to which he has given the name telpherage. The road consists of a light conducting rail, which may be a round steel rod, or a wire rope, strung along on poles at a sufficient distance above the ground to clear obstacles. The vehicles for this form of railway consist of suspended buckets, or "skips" as they are called, connected together by wooden strips.

A number of such vehicles, provided with an electro motor in a separate frame at the head of the string of carriages, constitute a train. As the load is distributed over a considerable distance, the supporting rail or cable can be light, and the whole structure may be comparatively inexpensive. There is no need of grading or of bridges, the line being strung across country with the same facility as an ordinary telegraph line, and with no more interference with the ordinary use of the ground. Prof. Jenkin has designed the road primarily for the transportation of freight, but it seems

possible to adapt it to passenger service. He does not regard it as a substitute for the ordinary surface road, but as affording a means for the cheap transportation of freight through districts in which the traffic would not be sufficient to warrant the building of the more costly surface line. In conjunction with Professors Ayrton and Perry the system has been worked out in a practical form, and an experimental line has been built at Weston, England. The self-governing motors of these latter inventors as well as their automatic block system have been adopted. These motors are especially applicable to such a line, as they are of small weight in proportion to the power developed, a motor weighing only 96 pounds being capable of giving one and a half horse-power.

The cables are attached to the supporting posts, so as not to interfere with the passage of the trains, by means of saddles placed at the extremities of cross-arms. These saddles are curved in a vertical plane so as to avoid an abrupt change of direction or corners in the cable roadway.

Two modes of constructing such lines have been devised, depending upon the way in which the current is applied, which the inventors term the "series" and "cross-over parallel" systems. In the former the line is divided into a number of successive sections, the electric connection between which can be broken by a passing train, and restored again automatically as the train moves on. The trains must be slightly longer than a section, so as to avoid the possibility of their running on to a section and being deprived of power. With this construction, when a train is partly on one and partly on the succeeding section, the direct connection between the sections is broken, and the current has therefore to pass through the electro-motor. As the train moves on, it opens the connection between the section it is on and that immediately ahead, and closes the connection with the section just left. In this way the motor of the train is always supplied with current by the use of a single conductor. All the trains on the line are thus arranged on the line like a string of arc-lamps, the current going through the motor of each train in succession. One half of the length of the line constitutes the "up" and the other half the "down" line. The engraving, Fig. 3, shows this form of line, from which it will be seen that it is a very simple affair. In the other form, the "cross-over parallel," two conductors are used, but as one of them may be the up and the other the down line there is no disadvantage in the arrangement. The two conductors are arranged so that there are two circuits, one the outgoing, the other the return, only the first of which needs to be insulated.

These circuits are not, however, disposed so that each rail forms one circuit, but each of the two circuits crosses from one rail to the other, so that alternate sections of a rail are portions, the one of the outgoing, the other of the return

FIG. 3.—SERIES TELFER LINE.

circuit. A train standing partly on each section would therefore form a bridge across a simple multiple-arc circuit, precisely as an incandescent lamp does. This crossing over from one side to the other is done at the supporting posts, at which points the outgoing conductor must be thoroughly insulated. A number of the details of the system have yet to be worked out, and very probably the final forms will not be reached without considerable experimenting with actually working lines. The experimental line which has been constructed at Weston is arranged on the multiple-arc system. Different forms of rail, square and round steel rods, and wire ropes, are being tried with a view of determining the best form. The line is supported on posts 60 feet apart, and divided electrically into sections of 120 feet, the alternate ones of each rail being insulated. The train is of the same length as a section, and consists of seven buckets, each of which weighs one half of a hundred-weight, and can carry a load of two and a half hundred-weight. The locomotive weighs the same as a loaded bucket, so the total weight of a train is a trifle over a gross ton. The motor is connected to the driving-wheels by gearing of a special kind which has very little friction. One pole of the motor is connected by a wire with the leading wheel and the other with the last wheel of the train, the other wheels being insulated from each other, so that the train always forms a bridge from an insulated to an uninsulated section, and the current passes through the motor. Exhaustive tests of the capability of such a road have not yet been made, but Prof. Jenkin says that the experi-

ence so far gained warrants him in stating that with a line having rails one inch in-diameter there can be conveyed a useful load of 1,500 pounds on each alternate span of 120 feet, which is equivalent to $16\frac{1}{2}$ tons per mile. Moving at five miles an hour, this corresponds to the conveyance of $92\frac{1}{2}$ tons per hour, and, working 20 hours a day, to the transport of 1,850 tons a mile a day. The carriages, he says, run as smoothly as bicycles, the grip of the locomotive is entirely satisfactory, and there is no difficulty in insulation even with very high-tension currents. At present it is not proposed to work the lines from one station for a greater distance than five miles each way, so that a station will be required every ten miles. A large number of radiating lines can of course be worked from one station.

From the above it will be seen that the electric railway is sufficiently advanced to be ready for commercial development. While much, doubtless, remains to be done in working out the details of a thoroughly satisfactory equipment, the main features of a successful system have been determined. No new electrical discoveries are necessary to the practical realization of this mode of propulsion, and the problems which will be encountered in actual construction are not beyond the skill of the engineer. The essential pieces of apparatus which will have to be used in such a system—the steam-engine or water-wheel, the dynamo and electro-motor—are all in a commercial shape. The construction of a suitable roadway apparently presents no insurmountable difficulties. From an engineering point of view, therefore, the system is perfectly feasible,

but whether it is so on the basis of cost of operation is yet undetermined, though the experience had with the Siemens lines goes to show that it is. Prof. Ayrtton claims that the cheapening of railway transportation is one of the chief recommendations of the electric system. If further experience shows that this belief is well founded, there can be no question of the great future which awaits this system of railway operation. It is universally applicable; as capable of doing the work of a great trunk line as that of city and suburban roads. Its first field of operation is of course the latter, but, if successful here, its extension to the general railroad system of a country is simply a matter of time.

REFORMED CHURCHES. I. Reformed Church in America.—The summary of the statistics of this church, as they were reported to the General Synod in June, 1883, is as follows: Number of particular synods, 4; of classes, 33; of churches, 516; of ministers, 569; of candidates, 3; of families, 44,506; of communicants, 80,156; of baptisms, 3,988 of infants and 940 of adults; of baptized non-communicants, 29,599; of catechumens, 28,595; of Sunday-schools, 697, with 84,595 scholars. Amount of contributions: For religious and benevolent purposes, \$224,144; for congregational purposes, \$373,820.

The Board of Education reported to the General Synod that its receipts for the year, exclusive of interest from invested funds, had been \$7,516; and that \$7,522 had been paid into the Treasury of the General Synod for investment, and to found scholarships. The debt of the board was \$6,165, having decreased \$1,000. Sixty-six young men had been aided in preparing for the ministry, thirteen of whom had finished their studies and been licensed. Aid had also been given to parochial schools connected with seven of the churches.

The income of the Board of Domestic Missions, including interest from invested funds, had been \$39,224, and its expenditures \$25,125. The board also reported the receipt of \$6,329 on account of its church-building fund, with an expenditure of \$15,210, or enough to absorb the balance to its credit on the general account, and leave it in debt \$1,000. Seventy missionaries had been employed at 77 missions, with which were connected 4,459 members of the church; 88 Sunday-schools had been conducted, having an average attendance of 7,609 persons; and 445 persons had been received on confession of faith.

The receipts of the Board of Foreign Missions had been \$66,206. The missions, which are in China (the Amoy mission), India (the Aroot mission), and Japan, returned 12 stations, 128 out-stations, 18 missionaries, 23 assistant missionaries, 18 native ministers, 166 catechists or preachers, assistant catechists, readers, schoolmasters, schoolmistresses, colporteurs, and Bible-women, 87 churches, 2,848 communicants, 5 academies with 144 scholars, 95 day-schools with 2,028 pupils, and 18 theo-

logical students. The contributions of the native churches amounted to \$2,768; receipts of the Woman's Board of Missions, \$10,919.

The General Synod of the Reformed Church in America met in its seventy-seventh annual session in Albany, N. Y., June 5th. The Rev. William R. Duryea, D. D., was chosen president. Certain changes in the form for the administration of baptism to adults were asked for by the Classis of Poughkeepsie, whose memorial on the subject had been before two previous sessions of the Synod, and had been referred by the former Synod to a special committee to consider and report upon. The memorial was supported by a petition from the elders of Trinity Church, in Plainfield, N. J., asking that "some action be taken looking toward the harmonization of the authorized forms for admission into church-membership of those not baptized in infancy, and of those who were then baptized," and "that if any changes be made, they be made in favor of the latter form (that for those baptized in infancy), which embodies the essential faith of the church." The action of the Synod on the subject was as follows:

Resolved, That after the sentence "You are sincerely to give answer before God and his Church," in "the form for the administration of holy baptism to adult persons," shall be inserted a mark of reference directing attention to the following foot-note:

"The questions and answers of the form for public reception into full communion of those who have been baptized in infancy may at the option of ministers and elders be used in place of those contained in this form." (The form for the admission to membership is, so far as doctrine is concerned, the acceptance of the Apostles' Creed.)

Resolved, That a mark of reference be inserted after the word "good" in the second question of the form for the administration of holy baptism to adult persons, referring to the following explanatory note:

That is, "incapable of any saving good." Canons, third and fourth heads of doctrine, Art. III, "only those works which proceed from a true faith and are performed according to the law of God and to his glory are good."—Heid. Cat., xxxiii, Lord's Day, quest. 91.

Resolved, That a mark of reference be inserted after the word "church" in the fourth question of the same form, referring to the following explanatory note:

The articles spoken of are the Articles of the Apostles' Creed. See Heid. Cat., vii, Lord's Day, quest. 22, and the forms for "the administration of the Lord's Supper," and "the public reception into full communion of those who have been baptized in infancy."

Resolved, That the Board of Publication be directed to have the plates of the revised Liturgy amended in accordance with this action, and to incorporate these explanations in the copies of the Liturgy hereafter issued.

The Synod had been repeatedly asked to adopt expressions disapproving the connection of members of the church with the Masonic or other secret, oath-bound societies, and in response to such requests had, at a previous meeting, declined to express any opinion on the subject, but recommended that the matter be relegated to the conscience of the individual church-member and to the spiritual governors of the individual church. This action was reaffirmed, with the suggestion to members of

the church that, "out of regard to the fact that membership in Masonic and similar orders gives offense to many Christian consciences, and has become a fruitful source of injurious agitation and division in the church, they, in accordance with the law of Christian love, refrain from connection with such societies." A few churches in the West which had withdrawn from connection with the Synod during the agitation of this subject, were invited, in view of the present action, to return. A resolution adopted by the Synod called attention to the fact that as the Sunday-school is one of the religious services of the church, it is under the same supervision of the consistory as are all the other religious services. The title of the "Adressor" of the Synod was changed to "Vice-President," and that of "Quæstor" of the Classis to "Treasurer."

II. Reformed Church (German) in the United States.—The following is a summary of the statistics of this church, as they are given in the "Almanac of the Reformed Church in the United States" for 1884: Number of synods, 7; of classes, 51; of ministers, 767; of congregations, 1,482; of members, 166,578; of unconfirmed members, 101,309; of persons who communed, 183,435; of baptisms, 18,481 of infants and 1,163 of adults; of Sunday-schools, 1,844, with 107,856 scholars; of students for the ministry, 126. Amount of contributions: For benevolent purposes, \$188,901; for congregational purposes, \$745,749. The literary and theological institutions of the denomination comprise 17 colleges, collegiate institutes, seminaries, and academies. The periodicals include 15 weekly, semi-monthly, monthly, and quarterly periodicals in the English language, and 6 in the German language. Four orphan homes are supported. Home missions are conducted by the Joint Board of the Eastern, Pittsburg, and Potomac Synods, and by the separate boards of the German Synod of the East, the Ohio Synod, and the Synod of the Northwest. The general foreign mission is in Japan, with the principal station at Tokio, conducted by two missionaries and their wives.

REFORMED EPISCOPAL CHURCH. The ninth General Council of the Reformed Episcopal Church met in Baltimore, Md., May 23d. Bishop Latané presided. A statistical report was presented, showing that the number of communicants of the Church was 6,193; number of baptisms during the year, 923; number of confirmations, 519; number of Sunday-school pupils, 10,507; amount of collections, \$192,538; value of church property, \$614,500. The treasurer of the General Council reported that his receipts had been \$26,857, and that he had a balance on hand of \$687. Reports of the condition of the several Synods were made by Bishop Stevens, of the special jurisdiction of the South; Bishop Latané, of the Synod of the South; Bishop Cheney, Bishop Nicholson, Bishop Fallows, of the missionary jurisdiction of the West and Northwest; Bishop Cridge,

of the missionary jurisdiction of the Pacific; Bishop Wilson, of the Synod of Canada; and Bishop Sugden, of the Synod of Great Britain. The Synod of Great Britain asked to be allowed an organization independent in administration and government, and this was granted. A gift of 160 acres of land near the city limits of Chicago, for a theological seminary, conditioned upon the Council raising \$20,000, was accepted, and a Board of Regents for the proposed institution was organized. A report from the General Committee recommending a suspension of the publication of the amended Prayer-Book was approved, and a revision of the Prayer-Book was referred to the Committee on Doctrine and Worship.

The observance of Dec. 2, 1888, as the tenth anniversary of the organization of the Reformed Episcopal Church, was commended to the churches. The subject of restoring the use of the service for the fourth of July from the Prayer-Book of 1785 was referred to the Committee on Doctrine and Worship.

REFORM IN THE CIVIL SERVICE. An act "to regulate and improve the civil service of the United States," which had been prepared by the Civil-Service Reform League and introduced in the Senate by Mr. Pendleton, of Ohio, became a law on the 16th of January (see CONGRESS, page 183). The national example was followed by the Legislature of the State of New York, which in May passed a similar act applicable to the State service, with authority for its extension to municipal service in cities of 50,000 inhabitants or more, in the discretion of their mayors. (See NEW YORK, page 566.)

Commissioners were appointed under the national act, and confirmed by the Senate before the adjournment of Congress in March. They were Dorman B. Eaton, of New York; Leroy B. Thoman, of Ohio; and John M. Gregory, of Illinois. Their first meeting was held in Washington, March 9th. Silas W. Burt, of New York, who had lately been superseded in the office of naval officer of that port, was named for chief examiner some days before, but had declined the appointment; Edward O. Graves, Chief of the Redemption Bureau of the Treasury Department, also declined the place. Dr. B. Randolph Keim, of Pennsylvania, was afterward named by the President, on the recommendation of the commissioners, but the selection occasioned so much criticism that, after some delay and hesitation, Mr. Keim was induced to withdraw. Charles Lyman, a clerk in the Treasury Department, was then appointed to the office. W. Woods White was appointed secretary of the commission, on recommendation of Dr. Gregory, but a statement having been publicly made that the selection was influenced by the consideration that it would give Dr. Gregory's son a business advantage in connection with Mr. White's private affairs, the latter promptly resigned, with an indignant denial that his appointment and acceptance had been influenced by any such consideration.

On June 6th William S. Roulhac, of North Carolina, was appointed secretary of the commission. In the mean time the commission had prepared the rules for appointments in the civil service, which, after some slight modifications, were approved by the President on the 7th of May. They were as follow :

1. No person in said service shall use his official authority or influence to coerce the political action of any person or body, or to interfere with any election.

2. No person in the public service shall for that reason be under any obligation to contribute to any political fund or to render any political service, and he will not be removed or otherwise prejudiced for refusing to do so.

3. It shall be the duty of collectors, postmasters, assistant treasurers, naval officers, surveyors, appraisers, and custodians of public buildings, at places where examinations are to be held, to allow and arrange for the reasonable use of suitable rooms in the public buildings in their charge respectively, and for heating, lighting, and furnishing the same for the purposes of examinations, and all other executive officers shall, in all legal and proper ways, facilitate such examinations and the execution of these rules.

4.—I. All officials connected with any office where, or for which, any examination is to take place, will give the Civil-Service Commission and the chief examiner such information as may be reasonably requested to enable the commission to select competent and trustworthy examiners; and the examinations by those selected as examiners, and the work incident thereto, will be regarded as a part of the public business to be performed at every such office. II. It shall be the duty of every executive officer to promptly inform the commission in writing of the removal or discharge from the public service of any examiner in his office, or of the inability or refusal of any such examiner to longer act in that capacity.

5. There shall be three branches of the service, classified by the Civil-Service Act, not including laborers or workmen, nor officers required to be confirmed by the Senate, as follow: I. Those classified in the department at Washington shall be designated "The Departmental Service at Washington." II. Those classified under any collector, naval officer, surveyor, or appraiser in any customs district shall be designated "The Classified Customs Service." III. Those classified under any postmaster at any post-office, including that at Washington, shall be designated "The Classified Postal Service." IV. The several customs districts now having the classified service herein referred to, being those where the officials are as many as fifty, are the following: New York city, N. Y.; Boston, Mass.; Philadelphia, Pa.; San Francisco, Cal.; Baltimore, Md.; New Orleans, La.; Chicago, Ill.; Burlington, Vt.; Portland, Me.; Detroit, Mich.; Port Huron, Mich. V. The several post-offices now having the classified service herein referred to, being those where the officials are as many as fifty, are the following: Albany, N. Y.; Baltimore, Md.; Boston, Mass.; Brooklyn, N. Y.; Buffalo, N. Y.; Chicago, Ill.; Cincinnati, O.; Cleveland, O.; Detroit, Mich.; Indianapolis, Ind.; Kansas City, Mo.; Louisville, Ky.; Milwaukee, Wis.; Newark, N. J.; New Orleans, La.; New York city, N. Y.; Philadelphia, Pa.; Pittsburgh, Pa.; Providence, E. I.; Rochester, N. Y.; St. Louis, Mo.; San Francisco, Cal.; Washington, D. C.

6.—I. There shall be open competitive examinations for testing the fitness of applicants for admission to the service, which examinations shall be practical in their character, and, so far as may be, shall relate to those matters which will fairly test the relative capacity and fitness of the persons examined to discharge the duties of the branch of the service which they seek to enter. II. There shall also be competitive examinations of a suitable character to test the fitness of persons for promotion in the service.

7.—I. The general examinations under the first clause of rule 6, for admission to the service, shall be limited to the following subjects: 1. Penmanship, copying, orthography, and letter-writing. 2. Arithmetic, fundamental rules, fractions, and percentage. 3. Interest, discount, and elements of book-keeping and of accounts. 4. Elements of the English language, and the proper construction of sentences. 5. Elements of the geography, history, and Government of the United States. II. Proficiency in each of these subjects shall be credited in grading the standing of the persons examined in proportion to the value of a knowledge of such subjects in the branch or part of the service which the applicant seeks to enter. III. But no one shall be entitled to be certified for appointment whose standing upon a just grading in the general examination shall be less than 65 per cent. of complete proficiency in the first three subjects, or less than 50 per cent. in the last two subjects mentioned in this rule, and that measure of proficiency shall be deemed adequate. IV. But for places in which a lower degree of education will suffice, the commission may limit the examination to—1. Penmanship, copying, and orthography. 2. The fundamental rules of arithmetic; but no person shall be certified under this examination of a less grading than 65 per cent. on each subject. V. And the commission may also hold examinations of a higher grade, or upon additional or special subjects, to test the capacity and fitness which may be needed in any special place or branch of the service.

8. No question in any examination, or proceeding by or under the commission or examiners, shall call for the expression or disclosure of any political or religious opinion or affiliation, nor, if known, shall any discrimination be made by reason thereof; and the commission and its examiners shall discountenance all disclosures before either of them of such opinion by or concerning any applicants for examination, or by or concerning any one whose name is on any register awaiting appointment.

9. All regular applications for the competitive examinations for admission to the classified service must be made on blanks in a form approved by the commission. All requests for such blanks and all applications for examination must be addressed as follows: I. If for the classified service in any department at Washington, to the United States Civil-Service Commission, Washington, D. C. II. If for the classified postal service, to the postmaster under whom service is sought. III. If for the classified customs service, to the head of either customs office in the customs district in which service is sought. All officers receiving such applications will indorse thereon the date of the reception thereof, and transmit the same to the proper examining board of the district or office where service is sought, or, if in Washington, to the Civil-Service Commission.

10. Every examining board shall keep such records, and such papers on file, and make such reports as the commission shall require, and any said paper or record, in the charge of any examining board, or any officer, shall at all times be open to examination, as the commission shall direct, and, upon its request, shall be forwarded to Washington for inspection and revision.

11. Every applicant, in order to entitle the applicant to appear for examination, or to be examined, must state under oath the facts on the following subjects, as may be required by the regulations of the commission: I. Name, residence, and post-office address. II. Citizenship. III. Age. IV. Place of birth. V. Health and capacity for the public service. VI. Right of preference by reason of military or naval service. VII. Previous employment in the public service. VIII. Business or employment and residence for the last five years. IX. Education and such other facts as the commission may reasonably require, as showing fitness for the public service. The applicant must also affirm his qualification under section 8 of the Civil-Service Act, which is as follows: "That no

person habitually using intoxicating beverages to excess shall be appointed to or retained in any office, appointment, or employment to which the provisions of this act are applicable."

12.—I. Every regular application must be supported by proper certificates of good moral character, health, and physical and mental capacity for doing the public work, the certificates to be in such form and number as the regulations of the commission shall provide for. But no certificate can be received which contains any language inconsistent with the tenth section of the Civil-Service Act. II. No one shall be entitled to be examined for the classified postal service if under sixteen or over thirty-five years of age, or for the classified customs service or for the classified service at Washington, if under eighteen or over forty-five years of age, and no one shall be examined for a clerk or messenger who is under twenty-one years of age. But these maximum limitations of age shall not apply to those who have been honorably discharged from the military or naval service during the last war and are otherwise duly qualified.

13.—I. The date of the reception of all regular applications for the service at Washington shall be entered of record by the commission, and of all other applications by the proper examining boards of the district or office for which they are made, and applicants, when in excess of the number that can be examined at a single examination, shall be notified to appear in their order on the respective records. But any applicants in the several States and Territories, for the service at Washington, may be notified to appear before examination, at any place at which an examination is to be held, whether in any State or in Washington, which shall be deemed most convenient for them. II. The commission is authorized, in aid of the apportionment among the States and Territories, to hold examinations at places convenient for applicants for several different States and Territories, or for those examination districts which it may designate and which the President shall approve.

14. Those examined shall be graded, and shall have their grade marked upon a register after those previously thereon, in the order of their excellence, as shown by their examination papers, except that those from any State or Territory may be entered upon the register together in the order of relative excellence to facilitate said apportionment. Separate registers may be kept of those seeking to enter any part of the service in which special qualifications are required.

15. The commission may give a certificate to any person examined, stating the grade which such person attained and the proficiency in the several subjects shown by the markings.

16.—I. Whenever any officer having the power of appointment or employment shall make request therefor, there shall be certified to him by the commission or the proper examining board four names for the vacancy specified, to be taken in order from the proper register of those in his branch of the service and remaining eligible, regard being had to the apportionment of appointment to States and Territories, and from said four a selection shall be made for the vacancy. II. These certifications for the service at Washington shall be made in such order as to apportion as nearly as may be practicable the original appointments thereto among the States and Territories and the District of Columbia upon the basis of population as ascertained at the last preceding census. III. In case the request for any such certification or any law or regulation shall call for those of either sex, the four highest in order of that sex shall be certified; otherwise sex shall be disregarded in such certification. IV. No person upon any register shall be certified more than three times to the same officer in the customs or postal service, or more than twice to any department at Washington, unless upon request of the appointing officer, nor shall any one remain eligible more than one year upon any register, and no person,

while remaining eligible on any register, shall be admitted to a new examination of the same grade.

17.—I. Every original appointment or employment in said classified service shall be for the probationary period of six months, at the end of which time, if the conduct and capacity of the person appointed have been found satisfactory, the probationer shall be absolutely appointed or employed, but otherwise be deemed out of the service. II. Every officer under whom any probationer shall serve during any part of the probation provided for by these rules shall carefully observe the quality and value of the service rendered by such probationer, and shall report to the proper appointing officer in writing the facts observed by him, showing the character and qualifications of said probationer and of the service performed by him, and such reports shall be preserved on file. III. Every false statement knowingly made by any person in his application for examination, and every connivance by him at any false statement made in any certificate which may accompany his application, shall be regarded as good cause for the removal or discharge of such person during his probation.

18. It shall be the duty of every head of a department and office to notify the commission of the name of every person appointed to or employed in an official place in the classified service under him, giving the date thereof and the designation of the office or place from among those examined under said commission; and further, and in like manner, to inform said commission of the date of any rejection or final appointment of any said person after probation, and of every case of the promotion, removal, discharge, resignation, transfer, or death of any said person.

19. There are excepted from examination under these rules the following: I. The confidential clerk or secretary of any head of a department or office. II. Cashiers of collectors. III. Cashiers of postmasters. IV. Superintendents of money-order divisions in post-offices. V. The direct custodians of money for whose fidelity another officer is under official bonds, but these exceptions shall not extend to any official below the grade of assistant cashier or teller. VI. Persons employed exclusively in the secret service of the Government, or as translators or interpreters or stenographers. VII. Persons whose employment is exclusively professional, as doctors or lawyers, but no person so excepted shall be either transferred, appointed, or promoted, unless to some excepted place, without an examination under the commission. VIII. Heads of bureaus.

20. If the failure of competent persons to attend and be examined, or the prevalence of contagious disease or other sufficient cause, shall make it impracticable to supply in due season for any vacancy persons who have passed competitive examinations, such vacancy may be filled by any person who has passed a non-competitive examination, which the commission may provide for, but its next report shall give the reasons for every such resort to non-competitive examinations.

21. The Civil-Service Commission will make appropriate regulations for carrying these rules into effect.

22. Every violation by any officer in the executive civil service of these rules, or of the eleventh, twelfth, thirteenth, or fourteenth sections of the Civil-Service Act relating to political assessments, shall be good cause for removal.

These rules were not intended to cover examinations for promotions, those being left for later consideration. On the 16th of May the Civil-Service Commission adopted regulations for the conduct of examinations. They were as follow:

1. The chief examiner shall, as far as practicable, except when otherwise directed by the commission, attend the examinations held by the several Boards

of Examiners. He shall take care to secure accuracy, uniformity, and justice in all their proceedings, which shall at all times be open to him, but leaving the duty of the examiners for marking and grading those examined unimpaired. The commission will, in its discretion, designate one of its own members, or request the detail of a suitable person, to supervise examinations whenever deemed needful.

2. He shall prepare and submit to the approval of the commission proper forms and questions. He shall take care that the rules and regulations are complied with, and bring every case of injustice and irregularity observed by him to the attention of the commission. He shall take such part as the commission shall assign him in the work at Washington. It shall be his duty to confer, from time to time, with the heads of the postal and custom-offices which he officially visits concerning the regularity, sufficiency, and convenience of the examinations for the service under them.

Paragraph 3 relates to the duties of secretary.

4. The General Board of Examiners for the departmental service shall consist of two persons from the Treasury Department, two from the Post-Office Department, two from the Interior Department, and one from each of the other departments. But any three members may be designated by the commission to constitute the acting Examining Board for any examination. The Secretary of the Board of Examiners for the departmental service shall keep a record of its proceedings and have charge of its papers.

5. A special Board of Examiners will be selected by the commissioners for the departmental service at Washington for holding any examination whenever, in the judgment of the commission, the technical information or skill to be tested seems to require it.

6. In case of examinations to be held at other places than those having the classified service, the commission may designate an Examining Board for that purpose.

7. For each post-office the Board of Examiners shall consist of three persons.

8. The examiners for each customs district shall consist of two persons selected from the office of the collector, and one from each of the other customs offices which are subject to the rules; but if there be no office subject thereto, except that of the collector, the three shall be selected from his office.

9. Three examiners may serve as a board for conducting any examination, and the examiners for any customs district will determine which three shall hold any examination, taking care that if an examination is wholly or mainly for any office, one or more of the examiners from that office shall be on the acting board. In case of a failure or disagreement as to which three shall be the board for any examination, the commission or chief examiner shall designate the local examiners who shall serve. In case of the disability or necessary absence of one of the three examiners selected, the other two may conduct the examination.

10. Each Examining Board in the postal and customs service shall select one of its members to serve as secretary, and it shall be his duty to keep a complete record of the proceedings of the board and of all examinations held. He shall also keep the record of applicants and examinations, and the register of persons eligible for appointment. He shall have charge of all books and papers belonging to the board. On application of the proper appointing officer, he shall certify to such officer the names of the four persons of the highest grade remaining on the register, in conformity to the rules. He shall also answer all proper requests for application-blanks, and send due notifications to applicants to be examined, and shall give all other notices required to be given by the board.

11. No examiner or officer serving under the commission must attempt to control or influence removals.

12. Care must be taken by the examiners not to allow such visitors as they may admit, nor any conversation or other cause, to obstruct or distract those being examined.

13. Examiners must not disclose for public information, unless by the consent of those examined, more than the general results of examinations, without the details of answers given.

14. Complaints which show injustice or unfairness on the part of any Examining Board, or any one acting under the commission, will be considered by the commission, and, if necessary, it will revise the marking and grading on the papers, or order a new examination, or otherwise do justice in the premises.

15. The head of each post-office and of each customs office, to which the rules are applicable, should inform the local Board of Examiners of probable vacancies, that examinations for filling them may be held in due season.

16. The Board of Examiners for each office or district must promptly notify the commission of the need of holding an examination in and for such office or district, and may appoint the time for the same, but subject to any change the commission may find it necessary to make for the more convenient and effective discharge of its duty to see that the examinations are accurate, uniform, and just. The notice must state under which clause or clauses of rule 7 the applicants are to be examined, and must, when practicable, be given at least twenty days before the time appointed therein for the examinations.

17. Notices in writing shall be mailed to applicants for examination in the postal and customs service at least eight days before the examination, and they shall clearly specify the place and the time, including the hour, of holding the same.

18. All competitive examinations for admission to the civil service shall be in writing, except that tests of physical qualities or expertness may be added as the commission shall approve.

19. All the questions on any subject in the examinations will be given on a single sheet. The sheets will be numbered, and will be given out in the order of their numbers, each, after the first, being given only when the applicant shall return to the examiners the last sheet given to him.

20. Not less than four nor more than ten questions shall be given in each subject of the examination, and, to facilitate the marking, the questions in the same subject shall, as far as practicable, be equal in difficulty. Care shall also be taken that the time allotted for the examination shall be reasonably sufficient for answering the questions.

21. In general, no competitive examination should occupy more than five hours, exclusive of any intermission; and in case the examination be divided into two sessions, no questions given out during the first session should be allowed to be answered in the second.

22. Every examiner will exercise all due diligence to secure fairness, and to prevent all collusion or fraud in the examination.

23. The examination papers of each applicant shall be marked only with a number; and his name, with his number, shall be placed in a sealed envelope, which shall not be opened till after his papers are marked.

24. The examination papers shall be reviewed by each examiner separately, and in every case of disagreement the average of the markings to be made on the papers by all shall be the final marking on each question, subject to the regulation as to revision.

25. The views of the heads of post-offices and customs offices as to whether applicants for the several parts of the service under them shall be examined in the five subjects under clause 1 of rule 1, or only in the two subjects under clause 4 of that rule, will be accepted by the commission so far as its duty to require uniformity and adequate tests of capacity for doing the public work will permit.

26. The marking on the examinations has three objects: First, to determine the standing in each subject; second, to determine the average standing upon the whole examination; third, to determine whether the applicant is admissible to the register.

27. To determine standing in any subject, mark its answer in proportion to its completeness and accuracy, the perfect answer counting 100. Divide the sum of the credits given to all the answers in a subject by the number of the questions; the quotient will be the proper standing in the subject.

28. To give to each of the five subjects named in clause 1 of rule 7 the value due to their respective importance in the service, it is determined that they shall be counted, in making up the general average, when perfect, as follows: 1. Orthography, penmanship, and copying, 100. 2. Arithmetic—fundamental rules, fractions, and percentage, 100. 3. Interest, discount, and elements of book-keeping and of accounts, 100. 4. Elements of the English language, letter-writing, and the proper construction of sentences, 50. 5. Elements of the history, geography, and Government of the United States, 50. It will be seen that the total credits for a perfect examination in the five subjects will amount to 400. Dividing this by 4, being the number of hundreds, will give 100, which is the highest attainable general average.

29. To determine the average standing of any applicant, add to his total standing in the first three subjects one half his standing in the other two, and divide the sum by 4; the quotient will be his average standing.

30. No applicant the average of whose credits on the first three subjects is less than 65 will be placed on the registers of persons eligible to appointment. All above that will be placed on the register in the order of their average standing.

31. The average standing of persons examined in the two subjects under clause 4, rule 7, will be found by dividing the sum of their credits by 2. The average standing must reach 65 to entitle the applicant to a place on the register.

Blank forms were prepared for the use of applicants for admission to the civil service. In filling out the form of application, the applicant was required to state his name and address, his residence and occupation, the place and date of his birth, his citizenship qualifications, his residence, and his principal occupation during the five years preceding the date of his examination. He must also, if he has ever before been examined for or in the civil service, state when and where he served, if ever, and how long, and why he left the service. If he claimed preference by reason of military or naval service, he must state when he served, under what commander, and whether he could produce an honorable discharge. The applicant must also tell what has been his education, and in what school, academy, or college it was obtained; also what special experience or capacity he has which he thinks may be useful in the public service, and whether he uses intoxicating liquors to excess, or has any physical disqualification for the service. All of these statements must be made under oath, and accompanied by vouchers as to character, signed by not less than three or more than five citizens of good character and standing. Applications must be sent by mail to the commission or to the local boards.

Examinations were conducted in the various cities during the summer, the chief examiner or one of the commissioners acting with the local board in each case. The first examination at Washington began on July 12th, when three hundred applications for places in the

departmental service were on file. Examinations were held in other parts of the country by boards made up from the ranks of officials in the offices to which the law applied, the chief examiner or one of the commissioners supervising the work in all cases. Examinations were also held in different States for applicants for places in the service at Washington, under the rule that assigned a certain quota of places in the departments to the several States. The system was considered to be fairly in operation at the end of the year, but opposition to it had not wholly subsided, and there were intimations of an effort to be made for the repeal of the Civil-Service Act.

Under the act passed by the Legislature of the State of New York, commissioners were promptly appointed and confirmed, as follow: Andrew D. White, of Ithaca, President of Cornell University; Augustus Schoonmaker, of Kingston; and Henry A. Richmond, of Buffalo. Mr. White felt compelled to decline the office, and the Hon. John Jay, of New York, was appointed in his place, and was made President of the Board of Commissioners. At the first meeting, on May 31st, Silas W. Burt, of New York, was chosen for chief examiner. He promptly accepted the place, though he had declined a similar one under the National Commission. James A. Betts, of Kingston, was selected for secretary of the commission. The first work of that body was a general inquiry into the condition and requirements of the public service, with a view to the classification required by the act of May 4th. The classification was completed and approved by the Governor on September 3d. The commission decided to reorganize in the classification the special departments of the public service by bringing into a single class the clerks, wherever employed, into another the experts not attached to any great administrative institutions, and into another the non-experts not in such institutions. The last four classes represent all those other than the deputies and clerks employed on the public works and in the corrective and charitable institutions. The grades, particularly in the first subdivision of the first class, were arranged to provide for a systematic method of promotion. In the second division of the first class were assembled most of the positions which, presumptively, should be filled without examination:

Class I. All assistants and deputies of executive and administrative officers, and all officers and all clerks and other persons of whatever designation rendering services similar to those of clerks in any branch of the State service. Subdivision 1: First grade—clerks and like employes receiving an annual compensation of \$1,000; second grade—clerks and like employes receiving an annual compensation of \$1,000 or more, but less than \$1,200; third grade—clerks and like employes receiving an annual compensation of \$1,200 or more, but less than \$1,500; fourth grade—clerks and like employes receiving an annual compensation of \$1,500 or more, but less than \$1,800; fifth grade—clerks and like employes receiving an annual compensation of \$1,800 or more, but less than \$2,000;

sixth grade—clerks and like employes receiving an annual compensation of \$2,000 or more, but less than \$2,500; seventh grade—clerks and like employes receiving an annual compensation of \$2,500 or more. Subdivision 2. Deputies and assistants of principal officers or heads of departments, the clerk and reporter of the Court of Appeals, the secretaries of State boards and commissions (but not assistant secretaries, they being rated as clerks), the chief examiner of the civil service, treasurers of asylums, game and fish protectors, Superintendent of Public Buildings.

Class II. All persons of special qualifications (except those employed in the Department of Public Works, the salt-works, reformatories, asylums, and other charitable and corrective institutions), including directors or curators of museums, geologists, botanists, and entomologists and their respective assistants, librarians and their assistants, civil engineers and surveyors, chemists, sanitary experts, principals, professors, and teachers in normal schools, inspectors of quarantine hospitals, medical superintendent of emigrants.

Class III. All persons engaged in duties other than those of clerks in the courts and public offices and buildings at Albany and the State arsenals, except as laborers, and not included in the preceding classes. Subdivision 1. Court criers and attendants, court and other marshals. Subdivision 2. Superintendents and assistant superintendents in charge of public buildings under the General Superintendent. Subdivision 3. Keepers and janitors of public buildings, arsenals, bureaus, etc., office messengers, orderlies in public buildings, watchmen, firemen, porters, and porters-esses. Subdivision 4. Steam-engineers and all other persons engaged in expert mechanical duties in public buildings or arsenals.

Class IV. All persons employed in the Department of Public Works other than the assistant superintendents, collectors of statistics, and clerks (who are included in Class I), and excepting laborers. Subdivision 1. Superintendents of repairs. Subdivision 2. Inspectors of boats and cargoes. Subdivision 3. First grade, rodmen and levelers; second grade, assistant engineers below the rank of residents; third grade, resident engineers; fourth grade, division engineers. Subdivision 4. All others employed in said department not otherwise classified; first grade, all those receiving an annual compensation of less than \$500; second grade, all those receiving an annual compensation of \$500 or more.

Class V. All persons employed in the Onondaga Salt-Works, except the deputy superintendent (Class I). Subdivision 1. First grade, engineers, except the chief engineer, overseers of pumps, and supervisors of aqueducts and reservoirs; second grade, chief engineer. Subdivision 2. First grade, assistant inspectors of salt or of barrels; second grade, receivers and inspectors of salt or of barrels; third grade, chief inspector of salt and chief inspector of barrels. Subdivision 3. All others employed and not otherwise classified.

Class VI. All persons employed in prisons and reformatories, except those included in Class I. Subdivision 1. Wardens and agents of prisons, superintendents of reformatories. Subdivision 2. Physicians, chaplains, principal matrons. Subdivision 3. First grade, guards in prisons; second grade, keepers in prisons receiving an annual compensation of \$900 or less; third grade, keepers of prisons receiving an annual compensation greater than \$900; fourth grade, the principal keepers. Subdivision 4. Steam-engineers and others employed as expert mechanics in prisons and reformatories. Subdivision 5. First grade, teachers in reformatories receiving an annual compensation of less than \$500; second grade, teachers receiving an annual compensation of \$500 or more, but less than \$1,000; third grade, teachers receiving an annual compensation of \$1,000 or more. Subdivision 6. All other persons employed in prisons and reformatories except laborers; first grade, such persons receiving an

annual compensation of less than \$500; second grade, such persons receiving an annual salary of \$500 or more.

Class VII. All persons employed in asylums for idiots, the insane, the blind, and in deaf and dumb, and in other similar institutions, and by the Commissioners of Emigration, except those included in Class I and laborers. Subdivision 1. Superintendents of insane asylums. Subdivision 2. Superintendents of asylums other than those for the insane. Subdivision 3. Assistant physicians and pathologists in insane asylums. Subdivision 4. Physicians other than those in insane asylums. Subdivision 5. Stewards of asylums. Subdivision 6. Engineers and expert mechanics and tradesmen. Subdivision 7. First grade, teachers receiving an annual compensation of less than \$500; second grade, teachers receiving an annual compensation of \$500 or more. Subdivision 8. First grade, attendants, nurses, and orderlies; second grade, supervisors of asylums and wards. Subdivision 9. Superintendents employed in asylums and by the Commissioners of Emigration. First grade, all such persons receiving an annual compensation of less than \$500; second grade, all such persons receiving an annual compensation of \$500 or more.

In the above classification the inclusion of any specified official in any class, subdivision, or grade, shall not apply to any person acting as, or termed as, a deputy or assistant of such official, nor to any persons acting for such official, in case of absence, vacancy in office, or otherwise. The term "deputy" or "assistant" is not recognized in this classification unless such designation is authorized by law. Where any person receives a compensation rated, not by the year, but by the day, week, or month, the classification of such person, when dependent upon compensation, will be based on his or her equivalent annual compensation. This classification is not intended to determine nor suggest any method of appointment to, or examination for, any class, subdivision, or grade. The subdivisions are intended to mark the distinct kinds of qualification necessary in each class, and the grades in the subdivisions are designed as steps for advancement by formal promotion. The omission in the above classification of any official designation or appellation of a position in the service will not exclude such position from the classification, as it will be comprised in the class to which it belongs by the general specification of such class.

On submitting to the Governor the rules of the commission regulating admission to the service, December 8th, the commissioners said: "In the inauguration of a new system radically changing the methods of appointments to the civil service some features must necessarily be experimental. The commission has, therefore, deemed it prudent to make the application of the system in a measure progressive rather than final at the outset. Any modifications required can be made as they shall become apparent by experience." The rules do not in the general principles vary materially from those of the National Commission. They provide for appointments and promotions in the various grades of the service as established by the classification given above. These are arranged in five schedules, designated A, B, C, D, and E. The first includes the positions in subdivision 2 of Class I, and appointments may be made to these without examination, though examinations may be held at the request of the appointing officer, and the commission must be notified of all appointments within five days after they are made. Schedule B includes the

three grades of subdivision 1, Class I; office messengers and court orderlies in subdivision 3, Class III; subdivision 2 of Class IV; first grade of subdivision 3 and first grade of subdivision 5 of Class VI; and first grade of subdivision 7, Class VII. For these places appointments must be made by selection from those persons graded highest as the result of open competitive examinations. Methods of application and general directions as to examinations and appointments are given in the rules. Schedule C includes clerks in State-Prisons under Class I, persons of special qualifications in Class II; and a variety of positions requiring special training or technical knowledge as engineers, inspectors, superintendents, physicians, etc., under various classes. For these places the appointing officer may select in each case from the three persons graded highest as the result of a competitive examination, or the one graded highest of three persons named to the commission for competitive examination; or a person named by himself who upon a non-competitive examination shall be certified by the commission as qualified. Schedule D includes a variety of employments neither clerical nor requiring technical knowledge, such as janitors, steam-engineers, mechanics, etc., not including laborers. These are to be filled by persons designated as qualified after non-competitive examinations. Schedule E includes higher grades of clerks, inspectors, prison-keepers, teachers, etc., whose places when vacant are to be filled by promotion of those in lower grades after an examination similar to that which would be required for an original appointment to the same positions. Among the rules of the service are the following:

No person in the public service is, for that reason, under any obligation to contribute to any political fund or purpose, or to render any political service, and no person shall be removed or otherwise prejudiced for refusing so to do.

No person in the public service has the right to use his official authority or influence to coerce the political action of any person or body.

In the selection, nomination, or appointment of persons to fill positions in Schedules B, C, and D, or promotion of persons to positions in Schedule E, no regard shall be paid to the partisan political opinions, affiliation, or action of any person so selected, nominated, appointed, or promoted.

No question in any examination or proceeding, by or under the commission or examiners, shall call for the expression or disclosure of any partisan political opinion or affiliation of any person whatever, nor shall any discrimination be made by reason thereof; and the commission and its examiners shall discountenance all disclosure before either of them, of such partisan opinion or affiliation by or concerning any applicants for examination, or by or concerning any person on any register awaiting appointment or employment.

Every original appointment or employment in the civil service shall be for a probationary term of three months, at the end of which time, if the conduct and capacity of the person appointed or employed shall have been found satisfactory, the probationer shall be absolutely appointed or employed, but otherwise his employment shall cease.

Every officer under whom any probationer shall

serve during any part of such probation shall carefully observe the quality and value of the service rendered by such probationer, and shall report in writing, to the proper appointing officer, the facts observed by him, showing the character and qualifications of such probationer and of the service performed by him; and such reports shall be preserved on file.

Complete regulations for the conduct of examinations and the making and grading of applicants were prepared. Subjects for examinations under the different schedules of the service were divided into obligatory and optional, and the relative weight of each was designated, so that a general average for all could be readily computed. The following schemes for open competitive examinations for places in Schedule B give an idea of the scope and application of the system:

Clerkships, positions as collectors of canal statistics (Class I, Subdivision I, Grades 1 and 2).

Clerkships, positions as inspectors of canal cargoes (Class IV, Subdivision II).

OBLIGATORY SUBJECTS.	Relative weights.
1. Writing from dictation.....	2
2. Handwriting.....	4
3. Spelling.....	1
4. Arithmetic, numeration, simple addition, subtraction, multiplication, and division.....	3
Total.....	10

Candidates for the positions of office-messenger or orderly must be in approved physical condition for active duties. Applicants for position of prison-guard, in addition to the other requirements specifically named in Rule X, must furnish satisfactory vouchers that they are not irascible or passionate, and are of a kind and humane disposition. They must be not less than five feet nine inches in stature when unshod, and before being admitted to service must pass a physical examination by the prison physician.

The first Board of Examiners was appointed at Albany, on the 25th of December. It consisted of Hiram E. Sickles, official reporter of the Court of Appeals; James E. Morrison, Deputy Superintendent of Public Instruction; Willis E. Merriman, a clerk in the Comptroller's office; Richard G. Milks, a book-keeper in the Treasurer's office; and John G. Clifford, a clerk in the Insurance Department. The law respecting competitive examinations and the rules of the commission were to apply to appointments made after Jan. 4, 1884.

The application of the provisions of the law to cities of more than 50,000 inhabitants was left to the discretion of mayors, but before the close of the year steps had been taken in both New York and Brooklyn for the introduction of competitive examinations. Mayor Seth Low, of Brooklyn, was the first to take the matter up, and, after consultation with the commission, rules were formulated, the municipal service was classified, and examiners were appointed. Similar action was taken in New York, the mayor and heads of executive departments having first had a conference with the State Commission in September. The service was classified under four schedules, as follow :

Schedule A includes all deputies of officers and commissioners duly authorized to act for their principals, persons occupying a strictly confidential position, and stenographers.

Schedule B includes clerks, copyists, recorders, book-keepers, and others rendering clerical services not specially included in Schedule A.

Schedule C includes all persons not laborers or day-workmen who are not included in Schedules A and B.

Schedule D includes persons employed as laborers or day-workers.

Appointments to positions in Schedule A could be made without examination, but the appointing officer was required to file with the Examining Board, within five days after making such appointment, a formal notification setting forth the full name of such appointee, date and place of birth, length of residence in the city of New York, nature of previous employment, date of beginning of service and term for which appointed, salary, the name of the person in whose place the new man is appointed, and such other statistical information as the board may deem proper for registration.

Applications for appointments under the other schedules were to be filed with the Examining Board, accompanied by the following papers :

1. The affidavit of the applicant that he is eighteen years of age; that he is a citizen of the United States and a resident of the city of New York, stating the street and number of his residence, the extent, place, and nature of his education, and of his business training and experience.

2. A list of the optional subjects upon which he desires to be examined, if any; and a statement whether such application is limited to any particular office or offices in the service.

3. The certificate of not less than three nor more than five reputable citizens of the city of New York, that they have been personally acquainted with the applicant for at least one year, and believe him to be of good moral character, of temperate and industrious habits, and in all respects fit for the service he wishes to enter, and that each such citizen is willing that such certificate should be published for public information.

All examinations were to be in writing, on the following subjects :

OBLIGATORY.

1. Handwriting (as shown in next subject).
2. Copying from dictation.
3. English spelling (as shown in previous subject).
4. Arithmetic, viz. : Addition, subtraction, multiplication, and division, as applied to whole numbers and fractions.
5. Abstracting or digesting returns into summaries.
6. Questions relating to the city of New York.

OPTIONAL.

7. Copying from manuscript and indexing.
8. Arithmetic applied, viz. : Practical problems in proportion, percentage, interest, discount, and average.
9. Letter-writing on subjects connected with New York city affairs; grammatical correctness, clearness, and brevity of expression will be considered.
10. Book-keeping.

Every applicant must be examined in the six obligatory subjects, and may be examined further in such of the optional subjects as he may select.

The relative "weight" given to the obligatory subjects in making up the average standing will be as follows : Handwriting, 3; copying from dictation, 1; English spelling, 2; arithmetic, 2; digesting returns, 1; New York city data, 1.—Total, 10. Each subject will be marked upon a scale of 100, which represents the highest possible attainment.

The standing of a candidate on the optional subjects is to be marked according to the scale of 100, and is to be recorded in the same way. The aggregate results of each examination will be entered upon a register of eligible candidates. The name of no person can be entered upon the eligible list whose general standing on the obligatory subjects is less than 70.

The rules require that whenever the head of an office or department certifies a vacancy coming under the head of Schedule B to the Board of Examiners, he shall signify whether the position to be filled is a minor clerkship, or whether any of the special qualifications denoted by the optional subjects are essential, and if so, which ones. If a minor clerkship be certified, the names of the five persons having the highest standing on obligatory subjects will be returned by the board to the appointing officer, who shall fill the vacancy by appointing one of the five so certified to him, and shall notify the board of the appointment. If the appointing officer signifies that attainment in one or more of the optional subjects is essential, the Board of Examiners will return to him the names of the five candidates

whose standings on the subject in question are the highest (not being below the minimum of 70), and the vacancy shall be filled by the appointment of one of these five; but the Examining Board may at any time hold a competitive examination to fill a vacancy of this kind if in their judgment the eligible list does not contain five well qualified to fill the vacant position. No candidate on the eligible list shall be certified more than five times to the same appointing officer, except at the latter's request, nor shall the name of any person remain on the eligible list more than one year from the date of examination. In determining the special qualifications required for any position, the Board of Examiners will be required to consult the head of the department in which the position is to be filled.

The following are also among the regulations adopted by the mayor:

All original appointments to or employment in positions under Schedules B and C shall be provisional, and such provisional service shall not continue longer than six months, during which period the person so appointed or employed may at any time be peremptorily discharged from service. If, during that period, the conduct and character of the appointee are found satisfactory, he shall receive an absolute appointment, but otherwise his employment shall cease. Any one failing to receive permanent appointment at the end of six months shall be ineligible for one year for appointment upon the municipal service in any department.

No recommendation or question under the authority of these rules shall relate to the political opinions or affiliations of any persons whatever.

No one dismissed from the service for misconduct shall be eligible to appointment in any other capacity in any department of the municipal service within three years.
